THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb.

EFFINGHAM HOUSE,
ARUNDEL STREET, STRAND,
LONDON.

UNIVERSITY OF ILLINOIS
LIBRARY

LONDON
PRINTED BY EYRE AND SPOTTISWOODE,
EAST HARDING STREET, E.C.

CONTENTS.

An Architectural Causerie.

A Misdirected Attack. SOME of the borough councils of London are notorious for the disgraceful way in which they treat their officials, any Tom, Dick or Harry— butcher, pastry-cook or publican—deeming it his privilege to get up at a council meeting and criticise the surveyor or the engineer in such an insulting manner as to make it almost inevitable for them to resign. Criticism of a somewhat similar character was meted out to the City Architect (Mr. Joseph Hirst) at the last meeting of the Hull City Council, when the plans of the new City Hall were under consideration. One gentleman was good enough to state that if they put a bacon-box down with a pepper-caster on top of it, that would afford a fair representation of the outline of the building which is to occupy the centre of the Town Hall Square, “where the dock offices will be in contrast and where the lavatory will compare favourably with it.” Such witty remarks, as might be supposed, provoked much laughter, but we rather lose faith in this self-styled architectural critic when he says that, seeing its flat front, they would not be pleased, and that he understood Mr. Frank Matcham had already been called in “and had made some valuable suggestions”; which seems to imply that our critic looks on Mr. Matcham (who designed the London Hippodrome) as an architect of artistic merit. Other councillors at the meeting spoke against Mr. Hirst’s design, the plea being that they ought to have an open competition for a building which is estimated to cost £92,000; and “merchants, tradesmen, the legal and other professions, and the inhabitants generally,” have followed suit in decrying the design; while the local Press fills its columns with protests from “lovers of the beautiful,” ratepayers and others similarly qualified to speak. Then a frenzied leader-writer says: “How will Hull hold up her head when her citizens stand with visiting strangers in the midst of what ought to be a great, spacious and lordly square, surrounded by noble and dignified buildings? When the citizen points to his city’s public hall, will his cheek not mantle red with shame as he sees the stranger’s eye scan the shops beneath? . . . Is it to be endured? . . . Surely the kingdom should be searched for what is worthiest; surely the best and wisest counsel should be sought; surely the talent and genius of the land should be invited by competition to contribute their idea of what a public hall should be which would make Hull a proud and more beautiful city.” Now this sets forth what the general opinion is in Hull. We have not yet had the opportunity of seeing the design ourselves, but, judging from a very rough newspaper sketch of it, and recalling the very satis-

factory work which Mr. Hirst has already done (several examples of which we have illustrated), we should express the opinion that all this wild outcry is unfair to the architect, firstly, because the design is not what incompetent persons have described it to be, and secondly, the conditions imposed on him are overlooked, conditions which place the blame on the Council and not on their architect. To expect a man to produce a beautiful design for a city hall which has its ground floor made up of shops is asking too much, and so long as these are insisted on the design must be correspondingly marred. As to the question of open competition, we think the Council has done wisely in not adopting such a course. Their architect is familiar with the local conditions—the building materials, local labour and local traditions—and he has proved himself a capable designer. The opinion of the man in the street on architecture is not worth having: he knows nothing about it: he has vague likes and dislikes: his taste, or want of it, is bad:

reference department, unknown and unsuggested. At the close of the exhibition it is to be expected that many of these books will be sought for from the reference department for more complete study. Many books have to be brought before the general reader before he is aware of their existence. Such ignorance is often the only obstacle to a spirit of interest and enthusiasm the absence of which is too often put down to indifference. Mention may be made of Viollet-le-Duc’s “Lectures on Architecture” (translated), Stuart and Revett’s “Antiquities of Athens,” Britton’s “Architectural Antiquities of Great Britain,” Nash’s “Mansions of England in the Olden Time,” and Rickman’s “Attempt to Discriminate, &c.” Modern work is represented by volumes of “Architecture,” THE ARCHITECTURAL REVIEW, &c., and books on modern architectural criticism such as E. S. Prior’s “History of Gothic Art in England” or Leader Scott’s “Cathedral Builders.” This is an exhibition of real value

NO. 52, BEDFORD ROW, LONDON, W.C.

and his views are directed by his taste: yet this is the person who has been so busy in this outcry; this is the citizen whose cheek is to mantle red! Surely the heavens will fall. But in the meantime we would wish the lay critic to be quiet, for his voice is not pleasant nor his ideas worth the time and attention given to them. If a competition were held the cost of the building would be increased, and in all probability the design would prove inferior to Mr. Hirst’s.

Architectural Books in Libraries. It is interesting to note an exhibition of architectural books now on view in the Fine Art Gallery adjoining the public library at Cheltenham, the volumes being a selection from those in the reference department. The books are not arranged in cases, where one can only examine such pages as the librarian’s caprice dictates to show, but are laid out on open tables, so that Ruskin’s examples of the architecture of Venice can be looked through from cover to cover, and one has the opportunity of seeing many books which would otherwise have remained in the limbo of the

the nature of which should be encouraged and developed in other centres.

A Forthcoming Horror. THE announcement that an exhibition of Austrian fine art and decorative furniture is to be held in London during the coming season will be read with more dismay than pleasure, because a very shrewd guess can be made of the kind of work which will be exhibited; good work of its sort, but of a very bad sort. The South Kensington authorities have already seen fit to set before the public those characteristic examples of “L’Art Nouveau” which were offered to them by Mr. George Donaldson, and now we may expect to see some additional specimens dear to the heart of “Secessionists.” There is a glimmer of hope in the statement that the exhibition is being promoted by the Austrian Ministry of Commerce, but the fact that it will embrace “everything that is new, original or characteristic in Austrian decorative art” augurs the worst, for it means that we may expect a good percentage of,— curious—examples.

FRIEZE, BARBICAN.

SOME RECENT STREET ARCHITECTURE IN LONDON.—I.

By F. HERBERT MANSFORD.

TO say that East London affords an unprofitable field to the student of current street architecture is not to imply that its buildings are all dead dull, though most of them are so to the eye. Its wide main roads on a sunny day are less depressing in effect than Victoria Street, Westminster, Lisson Grove or the Harrow Road. But the architectural interest of East London is largely centred in ecclesiastical and municipal buildings. Structures of the former class are not fittingly considered in an article dealing with street architecture, and with regard to the latter the borough councils have scarcely had time to emulate the spirit which has stirred the West Ham Corporation. True, there is a new library at Limehouse, a modest building of yellow stocks with stone dressings, but as the only noteworthy features are the stone gable finials which take the form of open volumes, the less said about them the better.

The Whitechapel Art Gallery was illustrated in the BUILDERS' JOURNAL for April 24th, 1901. Like all Mr. Harrison Townsend's buildings, it is original and worthy of examination, but it appears to have squeezed itself into alien surroundings like its brother in Bishopsgate.

In no sense can the façade of the Welsh Calvinistic Methodist Chapel at Mile End be regarded as an example of ecclesiastical art. The custom of designing Nonconformist chapels as structures of the thirteenth century is rapidly passing away. The reaction is sometimes too complete and one cannot help noting the great secularity of design in the case of the Whitfield Tabernacle and of this chapel at Mile End. The rich buff colour of the terra-cotta, and the three semicircular windows divided by mullions give the elevation a very distinct and pleasing character, but, if it were not for the clearly lettered inscription, one might mistake this place of worship for a drill-hall. In the Mile End Road too is a blue Staffordshire brick tavern with yellow terra-cotta dressings, called "Ye Olde Red Cow," whilst in the Commercial Road is a well-designed and striking building, though the reason for its deep red colour from plinth to ridge is not obvious.

The construction of the District Railway Company's Extension to Bow has caused considerable demolition. It is to be hoped that the new buildings will be not unworthy of what was described by Hatton in 1708 as "a very extraordinary spacious street between Whitechapel Bars and the road to Mile End."

In a district like St. Luke's, where there is little of architectural interest beyond the asylum and a few churches, it is very refreshing to come across such a building as that recently erected for the Bovril Company at a corner of Old Street and Bunhill Row. The block attracts attention by its bulk and retains it by virtue of dignity and strength. The general walling is

of salt-glazed brickwork with the frequent use of stone for dressings. The long lines of string and cornice are broken twice by the vertical masses of the staircases, of which the narrow windows rise with the flights in a plain field of walling. The windows throughout the building are expressive: deep (14in.) reveals enclose those of warehouse and factory, while 4½in. is considered sufficient for the leaded casements of the offices. The main entrance of stone is recessed within a deep cove, cemented but unpainted, and approached by steps of white marble. Perhaps granite would have been more in keeping and some may consider the proportions of the doorway too low, but neither of these points can mar the pleasure evoked by so admirable a building. Messrs. Lanchester,

Stewart & Rickards have set a high standard of warehouse design in a neighbourhood which is becoming every year more commercial.

In Barbican, on the north side, is a new building of brick and stone, and between the rows of mullioned windows of the first and second storeys is a frieze sculptured in low relief illustrating the process of gold refining carried on within, a redeeming feature in an otherwise characterless street.

Against the south wall of the Metropolitan Meat Market a glass and iron shelter is being erected. Sir Horace Jones's elevations may not be very successful artistically, but the long level façades, decorated by frequently recurring pilasters, possess a quality of repose which is becoming scarce, and if this shelter be continued around the whole building it will be architecturally ruined. The section put up looks experimental, and should be declared an artistic failure, even worse than it was bound to be by the nature of the case.

The dullness of Cowcross Street has been relieved by the new front of a distillery for which Mr. Colcutt is responsible. The long low façade is composed of an unpolished granite ground storey of semicircular arches, a first floor of widely-spaced pedimented windows with intermediate walling of alternate bands of red brick and stone, and an upper storey of square windows set in a deep frieze enriched with panels sculptured in relief, the whole being surmounted by a bold cornice and balustrade. The building being low and broad, Mr. Colcutt had a rare chance to show how striking a simple roof may become in a town thoroughfare, but here, although the roof is ridged parallel to the road and broken only by a few small dormers, he has preferred to allow the pitch to be dictated by the modest internal requirements and placed a balustrade in front which effectively hides it from most points of view. But as designed the frieze and cornice crown the wall quite satisfactorily and with dignity.

Passing into Holborn the new front of the Birkbeck Bank looms largely in the view. Mr.

DISTILLERY, COWCROSS STREET, E.C. T. E. COLCUTT, ARCHITECT.

CHAPEL, MILE END ROAD, E.

Knightley had no easy task to treat satisfactorily a "pile" of this extent. The storeys mount up until the elevation becomes of unpleasant proportions, and it is scarcely too much to say that the building is only saved by the substructure of fclspathic piers and semicircular arches comprising the ground and mezzanine floors. Above the structure is faced with dull-glazed faience of a varying but always pale ochre tint, the deeper blue and brown of the older elevations not being repeated. The wall surfaces are cut up by a good deal of ornament in the way of modelled panels and portraits in relief. As most of these are about 60ft. above the pavement it is less regrettable that they chiefly represent generals more concerned with South Africa than such a peaceful institution as the Birkbeck Bank. Is there not a chance that if Macaulay's New Zealander ever wanders among its ruins he may mistake it for our new War Office!

Further west, Gwydyr Chambers presents a lofty front of red brick with stone mullioned windows surmounted by a bold cornice and two gables. The cornice is finely conceived, but the blocking-course above should have been deeper to allow the surmounting balustrade to be completely visible from the opposite pavement. The cornice is broken into short lengths by projecting bays carrying a small cornice of their own, of much smaller members although level with the former. It would seem that if the corona of the main cornice had been continuous greater breadth of treatment would have resulted.

The building, No. 52, Bedford Row, recently erected at the back of the First Avenue Hotel, and adjoining Gray's Inn, harmonises perfectly with its surroundings. Although based on Georgian models, the ironwork and other details disclose distinct freshness of design. The architects have solved the difficulty of treating satisfactorily five floors of windows in a plain wall by grouping the two lower and cutting them off from the upper three by a continuous balcony supported on coupled trusses. This treatment is the more appropriate here inasmuch as the lower floors are for professional purposes while the upper are residential.

Bloomsbury has not been itself since the bolts and bars succumbed to the attacks of the London County Council. Some of the longest gardens have been curtailed for the erection of flats, Russell Square is decked out with terra-cotta trimmings, and Southampton Row is a sad spectacle of lost opportunities, seeing that it will soon form a prolongation of the new street from Holborn to the Strand, and is to be widened accordingly between Holborn and Bloomsbury Place. The low blocks of flats on the east side revel in sham gables and other abominations, while the loftier buildings display attenuated columns eccentrically rusticated and features never studied in perspective, such as transomed windows of which the lower lights are nearly hidden by the balustrades in front and columns of which the bases are invisible.

The Hotel Russell and University College Hospital are the largest new buildings in the locality. With regard to the latter the underlying idea is that of a central administrative block communicating with four radiating wings by bridges. These wings are similarly connected to sanitary towers at the extreme angles of the site. An almost entire absence of corridor is thus achieved, but the isolation of the various blocks by air-ways has been already somewhat modified. Sanitary towers are distinctive features of hospital buildings and afford opportunities for picturesque design. In this instance Messrs. Alfred Waterhouse & Son have accepted the difficulty of a five-sided tower, strengthened the angles of the upper stage by boldly-corbelled turrets, and by carrying the main roofs of the ward pavilions over on arches have made it possible to terminate the towers as four-sided figures. On the transept of the west wing is a well-modelled panel of the royal arms recalling the fact that the whole structure is Sir Blundell Maple's memorial of the last Victorian Jubilee.

A lofty corner tavern of buff terra-cotta opposite the Whitfield Tabernacle in Tottenham Court Road is the work of Mr. Fitzroy Doll. The style of it, Gothic, is not what one might expect from its dedication to Apollo. The Muses look down from the nine niches in which they appear to

be sheltering from the rain. Certainly the umbrella-like canopies between the first floor windows are too low, and must have reminded the architect of one of the disadvantages of terra-cotta, inasmuch as stone canopies could have been modified without delay. Apollo, who is discreetly placed a storey higher, is less sheltered although less draped; he is perhaps considered to be above the clouds. The gables of Parnassus exhibit traceries of alternating designs, and the turrets are finished with battlemented parapets.

(To be continued.)

ARCHITECTURAL ASSOCIATION.

WOMEN PRACTISING ARCHITECTURE.

By Miss ETHEL M. CHARLES.

A MEETING of the Architectural Association was held on Friday evening last at 9, Conduit Street, W., the chair being occupied by the president, Mr. W. Howard Seth-Smith. After the minutes of the last meeting had been read and confirmed, Messrs. P. W. G. Rudhall (Brighton), C. K. Roe (Kensington) and B. Drummond (Fleetwood) were elected members of the Association.

A vote of thanks was proposed to Professor Beresford Pite for allowing members to visit Christ Church, Brixton Road, on February 1st. The president then announced the following additional donations to the New Premises Fund:—

	£	s.	d.
C. B. Arding	-	-	5 0 0
Arthur Harston	-	-	3 3 0
A. H. Ryan-Tenison	-	-	2 2 0
H. Dymoke Wilkinson	-	-	2 2 0
H. I. Potter	-	-	1 1 0
T. R. Hooper	-	-	1 1 0
V. Wilkins	-	-	1 1 0

Donations previously announced* 15 10 0
3,715 11 6

Total - - - £3,731 1 6.

(* In the total published in our last issue there was an error of £1 ls. due to one donation having been repeated.)

Some donations to the library were next announced, after which Miss Ethel M. Charles read her paper on "A Plea for Women practising Architecture." She said:—

I appear before you to-night with a certain amount of diffidence, as the subject under discussion is not of my own choosing, and I fear I cannot do it justice. The title, to start with, is somewhat misleading. The dictionary says: Plea means a lame excuse or apology. Now I do not propose to offer you any lame excuses or apologies, all of which would be out of place. I shall merely bring to your notice some facts relative to women and architecture, with most of which you are doubtless already familiar. Then again, the title seems to suggest that I am conscious of a feeling against women architects, and since I read the paper before your Association it further implies that I believe such hostility is to be found amongst your ranks. Now I wish it to be clearly understood that I disclaim both of these assumptions. Doubtless your Committee had their thoughts directed to the choice of this subject by the knowledge of the existence of this feeling; but, personally, I have never met with it. No one has ever maintained before me that a woman should not practise as an architect, and if this view is held I venture to think it can only be held by those outside the profession, who are consequently not acquainted with the functions, powers and responsibilities of an architect.

Since you are members of the profession, it seems superfluous to address you on the subject as you must know better than anyone what are the qualifications necessary for the exercise of the same, and therefore know better than anyone that it is not a case of man or woman being best fitted to practise this art, but that it is entirely a case of personal capacity.

In a back number of the "British Architect" I came across the following remark:—"Whether women as a whole are fitted to take up the profession of architecture we hold strong and, it may be, conservative views—views which we do not think it would serve any useful purpose to discuss." I hope very much that some one

HOTEL RUSSELL: ARCADE GALLERY TO HALL, FIRST FLOOR. C. FITZROY DOLL, ARCHITECT.

present holds similar strong and conservative views, and that he will be kind enough to express them, as I may tell you the subject was selected by your Committee as being a peculiarly useful and suitable one.

It would be a bold man who would assert that "women as a whole" are fitted to take up the profession, considering that so few women have turned their thoughts in its direction; but it would be a still bolder man who would assert that men as a whole are fitted to take up the profession, vide the enormities that are daily committed by men in the name of architecture. I repeat, it is not a case of men versus women; it is a case of individual capability and aptitude.

However, there are some people, we are given to understand, who do maintain that woman, *per se*, is unsuited for practising our art. Where in the weak point lies we shall no doubt discover in the course of the evening; but as far as I can judge it lies outside the woman, and is not a defect inherent in her. I suppose the reason why women should not practise architecture is because, except in one or two isolated cases, she has not practised it; and that is just no reason at all.

The same objection is brought forward every time that women have attempted to enlarge

their sphere of action, and yet yearly new proofs are given that intellectually women can, at least in many cases, hold their own with men. The results of University examinations show it; members of the medical profession testify to it; the legal profession numbers women in its ranks, both in France and in America, though up till now in England women have only been allowed to study for but not to practise at the Bar. "Let them study by all means," the conservatives say, "but draw the line at practice." And what is the use of instruction, I ask you, if it is to be turned to no purpose? What is study without an object? knowledge without application? It is simply creating wants without granting the power of satisfying them. Living is not learning, but applying what one has learnt.

If, then, it is granted that woman is intellectually capable of wrestling with the problems of architecture, are we to suppose that she is physically incapable of carrying on the work entailed? It were unreasonable to say her strength is not equal to the task when we see what women actually do in this country. Take chainmakers, for instance. Hundreds of women are employed in the very heavy work of chain-making, a most arduous trade, and you must

remember how two or three years ago certain philanthropists were anxious that legislation should interfere and put a stop to this, as they asserted the work was too great a strain for a woman. This intervention only resulted in the Home Secretary being besieged by indignant deputations of these same women, all protesting their competence and defiantly baring their muscular arms as evidence of the strength on which they prided themselves. Then, again, our agricultural labourers are not by a long way all men. In harvest time, when the work requires to be got through with all speed, women are called out to labour side by side with their husbands and brothers; they toil from earliest dawn to latest twilight, through all the burning heat of the early autumn day, and, so far from succumbing to this exposure, they weather it with the best of the men and live on to seventy and eighty years of age. Now the bodily fatigue an architect must be prepared to undergo cannot be compared to the physical strain our women endure when employed as field farers or as chainmakers.

I do not mean to say that the physical labours that women undergo as labourers or chainmakers fits them for the intellectual work of architecture. But I wish to point out that women are not all such delicate creatures as some people believe them to be.

I do not mean to make light of the arduousness of the profession. The mere study of architecture involves a great deal of physical as well as mental strain, and since practice means the continuance of study and, added to this, responsibility, the profession is certainly not one to be adopted by the physically feeble. But women are not all physically feeble any more than men are all physically strong. You have heard of architects—men—breaking down through overwork, but you do not for that reason say that all men are unfitted to practise the profession. I have never heard of a woman architect breaking down, but neither do I assert that all women are fitted to practise architecture.

Those who base their objections to women architects on the fact that they are an innovation, and therefore to be suppressed, will fling their prejudices and fears to the winds when what is now an innovation comes to be a recognised institution. Already in America one town has a lady for a consulting architect, and we are given to understand that her designs for schools, prisons and railway stations compare favourably with other similar works in the country.

But there are some opponents who are more specific in their objections, and it is with these we must now deal. Their objections really arise from an imperfect knowledge of what an

HOTEL RUSSELL: GROUND-FLOOR PLAN.

architect is. There is a general idea afloat that architects "make plans" and climb ladders, but beyond these two accomplishments nothing certain seems to be known. The former occupation is acknowledged to be quite a legitimate one for a woman, provided she have the necessary brains, but the latter cannot be countenanced for a moment, even though she may be sufficiently courageous to attempt it, and can be trusted not to lose her head on the scaffolding. As far as I can gather, it is not the climbing that is objected to, but the fact that she may be *seen* climbing the ladder. Therein lies the difficulty. No less an architect than Wren shows us a way round, if not over, it. The famous Duchess of Marlborough informs us that Wren "was content to be dragged up in a basket three or four times a week to the top of St. Paul's, and at great hazard, for £200 a year." No one could object to a woman being hoisted up in a basket any more than they could object to her making use of the more conventional elevator. Climbing a ladder is condemned as unwomanly, but so was riding a bicycle or being seen on the top of an omnibus not so very long ago, and yet all are now seemingly reconciled to these unwomanly practices. Besides, the latter question could only be raised by persons who are in ignorance of the portion of a lifetime that an architect spends upon a ladder, and this is so infinitesimal as to be unworthy of consideration.

But, besides the objector to innovation and the objector to ladder-climbing, there is the man who has dealt personally with architects as their client, and who knows very definitely what an architect is and what he expects from him. He must be a thoroughly artistic, scientific and practical man. He must be able to design at all possible speed—by return of post we were told last Friday—a convenient, durable and beautiful building of any one of the three groups into which buildings may be roughly classified—domestic, ecclesiastical and civil. He must have an intimate and familiar knowledge of every material and every trade employed in the realising of the said building, in order that none but the best of its kind and the best of technical skill may be employed. He must be a master of scientific construction, in order to prevent waste of time, material and money. He must keep all accounts relating to the work, bear in mind the interests of client and contractor, and manage everything without allowing any friction to come about between the different parties concerned. This list is not complete; I have mentioned but a few functions required by an employer of his architect. For the sake of argument we will suppose that they appear to offer just so many objections to a woman following architecture.

To succeed in architecture one must be, as I have said, artistic, scientific and practical in business matters; that is to say, success is largely a matter of natural gifts, education and experience. Now, who will assert that the necessary gifts are not and cannot be possessed by woman; that she does not receive the requisite general education, and that experience may not be acquired by her as well as by man.

Let us look first at the aesthetic side of the question. Architecture has been defined as good construction inspired by an artistic motive or by the instinct of the beautiful. Now this instinct of the beautiful, or as the French put it better, *ce sentiment du beau*, is as a rule more strongly developed in the woman. Nearly every woman is more or less impressionable and receptive, that is, she is an artist by temperament. Her taste will lead her instinctively and intuitively to a result which a man will reach by a series of criticisms and reasonings. He sees the truth; she feels it. The beautiful is attained by both; what matter if the paths they follow be different.

In most cases (outside the profession, be it understood) who is it that cares to be surrounded by beautiful objects and attempts as far as is possible to make the home a thing of beauty? It is certainly not the average man, who so long as he is comfortable cares little for the appearance of his surroundings. It follows, then, that it must be the woman, who will cheerfully sacrifice even comfort to her conception of beauty, if any choice have to be made between the two.

Some people go so far as to say that a woman

must necessarily know how to plan a house better than a man, because her household duties suggest to her the wants and requirements that must be met. We do not entirely agree with this view. The best housekeeper in the world may have most definite ideas as to what she requires, but she will not produce a plan—that is, the suitable disposition of spaces—till she has realised what rules and precepts must be obeyed in planning a house. And these rules, being all based upon common-sense and obvious reasoning, are as patent to men as they are to women.

We must not, however, lose sight of the fact that the influence of women in domestic architecture has been felt ever since the progress of social relations made her the equal instead of the slave of man. Woman's position in a country is the surest sign of the social progress in that country, and it was in the sixteenth century, when women began to be respected "as a whole" and not only in individual instances, that

have, it seems, little cause to regret old Chatsworth and Oldcotes. Besides her three country seats, this lady left "stately almshouses for twelve poor people" in Derby, and personally superintended the construction of "a splendid mural monument" to her own memory in All Saints' Church, Derby. Her biographer, alluding to her passion for building, describes her as "a woman of a masculine understanding and conduct; proud, furious, selfish and unfeeling." Apparently we are to gather that these unattractive qualities, pride, violence and egoism, go hand in hand with a masculine understanding. If, as Hardwick shows, she lacked artistic feeling, she was, on the other hand, a thoroughly practical woman. Of the four husbands she outlived three were wealthy men who were able to supply her with the means of indulging in her favourite pursuit.

In France, where women stand out more prominently than in England, and during the early Renaissance, when they were most con-

UNIVERSITY COLLEGE HOSPITAL, W.C. ALFRED WATERHOUSE AND SON, ARCHITECTS.

domestic architecture regained its prominence. It was when a woman ruled this country and by her personality influenced many that castles, cathedrals and colleges—buildings designed by men for men—ceased to be the most important architectural objects erected. Elizabeth's reign is remarkable for the number of radical changes which took place, and in no direction was the change so marked as in architecture.

At the time when, under James's rule, the Scotch were dwelling in fortresses about as comfortable as a Norman keep, the English under Elizabeth were vying with each other as to who should build the most roomy, most convenient and most beautiful houses. It is noteworthy that the great Queen spent not a penny herself in the interests of building, but she gave her noblemen much moral support, encouraging them to spend their thousands in erecting palaces worthy of receiving her as a guest. One of the most indefatigable builders of that time whose name has come down to us was a woman, Elizabeth of Hardwicke. Of the "three most elegant seats that were ever raised by one hand," so says her biographer, only Hardwicke Hall remains, and judging from its monotonous symmetry and extravagant window-space, we

spacious as politicians, warriors and poets, we find them occupied with building at an earlier date than at home. Marie de Pierre-Vive, Dame du Perron, one of the ladies of the household of Catherine de Medicis, was officially associated with Philibert de l'Orme during the erection of the Tuileries. In 1566 her name stands among the list of "MM. les Surintendants des Batiments du Roy," and it is interesting to note that where she and de l'Orme signed papers together, Dame du Perron's name comes first. Her royal mistress was another woman of "a masculine understanding," and insisted on her own plans being used for her palace. De l'Orme writes to her: "Lequel Palays je conduis de votre Grace suivant les dispositions, mesures et commandement qu'il vous a plait m'en faire."

But however artistic a woman may be, her natural gifts alone will not suffice any more than will those of a man without study and direction. Art has its restrictions and its limitations, which must be recognised and appreciated if truth and nature are to be our guides; and architecture is particularly restricted and limited both in theory and in practice. In theory it is bound by those rules of art inspired by taste based on tradition, and by those rules

of science which can be demonstrated by invariable and absolute formulæ. And in practice it is limited by structural conditions, which, if neglected, result in the collapse of the building; it is limited by the physical properties of material, by the climate, by the habits and customs of the moment.

Study of æsthetic rules produces fine designs and study of scientific laws produces fine construction. Now, construction demands a knowledge of the principles of mathematics besides a knowledge of the properties of building materials. Mathematics involve logic, or the science of reasoning correctly, and hitherto logic has been held to be the peculiar inheritance of man as opposed to woman. It may be freely granted that among uneducated women possibly a larger proportion are more illogical in their every-day conclusions than among an equal number of uneducated men: but it by no means follows from this that the brain of the average woman of education is less capable of mastering the science of logic than that of the average man of education. Now, we are only discussing cultivated women, and all reference to the uncultivated and illogical class is beside the question. That logic can be mastered is proved by the successful results achieved by women at the Universities, where they show peculiar aptitude for the science of mathematics, the numbers who devote themselves to this study being great, out of all proportion to those who select other schools or triposes. Again, at the École des Beaux-Arts, where the architectural course includes, besides an immense variety of other subjects, a very high standard of mathematical ability, a woman, an American, has lately had the honour of carrying off the Premier Prix over the heads of her brother students.

But pure mathematics are of little use without familiarity with the properties of building materials, and this familiarity, it is argued, can only be gained by a technical knowledge of the trades employed in building. In the Middle Ages the architect was only distinguished from the workman by conspicuous natural gifts and greater skill in technique; he who was most familiar with his materials produced the finest designs. The workshop was then the training ground for the embryo architect, and doubtless would have proved a rough school for a woman. But now, however much the fact may be deplored, most of the architect's work is produced in an office and not in a workshop, and is due more to his intellectual activity than to his manual skill in any trade. If, then, good design depends upon the proper use of material, and this use may only be learnt through handling it, how comes it that fine designs are produced by men who are in no way fitted to work with such material, and that on the other hand most of the builders who dispense with the services of an architect, and many of whom are skilled in one or more trades, produce crude results which, though they strive after, fail to realise architectural effect? The answer is simple. It is largely a matter of education and deeper preparation which enables the sharpened intelligence to grasp more readily the principles of technical skill. This general education is indispensable to architectural study, and since there is but slight difference nowadays between the course of education pursued by men and women I cannot see that the absence of workshop training should nowadays hamper a woman any more than it does a man. Do not mistake my meaning. Education cannot create the gift of design—for designers, like poets, are born and not made—but it fosters and encourages this gift and calls out the highest faculties when they do exist in the student. No amount of training will make the deaf and dumb to sing; but, for all that, training is invaluable, not to say essential, to a singer who

intends to do his voice justice. If I may be allowed a misquotation:—

"Books, gowns, degrees will leave a fool a fool.

But designs are best when the designer's been to school."

Granted, then, that woman is fully competent as far as the æsthetic and scientific sides of the profession are concerned, there remains the economic side to be considered. This covers all the business transactions that take place between the architect, client and contractor, and involves the exercising of a large amount of tact in order to make matters run smoothly. Without tact a business man will not go far, and this indispensable quality seems universally acknowledged to be dealt out more generously to woman than to man. In France every woman is born a business man and her taste is never questioned, whereas in England it is the exception to find a man who combines artistic talents with business qualities.

The stumbling-block in the business relations seems to be that the architect is responsible for the quality of the work done and so has to oversee and direct the workmen. This, for some reason, is supposed to be beyond the powers of a woman; I am told it is objected she cannot

servants and labourers, it shall be construed his fault, and he shall be liable to be censured by the Commissioners." Besides, swearing at one's subordinates is really not as fashionable as it used to be. In the Army and the Navy, where formerly the slightest order was accompanied by a volley of oaths, the change is strongly marked, and the officer who now so far forgets himself as to swear at his men lays himself open to a severe reprimand from his superior officers.

I think I have touched upon most of the points which might be brought forward as objections to women practising architecture, and I trust we shall all be agreed that the obstacles are more imaginary than real. But there is one other point I ought to refer to before closing, and that is the "new style" that some people are clamouring for. Since women began to study architecture it has been suggested that they may supply this pretended want, but as yet there has been little to warrant the conjecture that fresh inspiration will come from that quarter. Women make intelligent interpreters and passionate disciples, but, to judge from the testimony of bygone centuries, their power stops short at creation. It may be

wrong to assume that women are totally wanting in inventiveness, and it may all be a question of upbringing and training. Hitherto men have always led the way, for the race is to the swift and the battle to the strong, and men have been the swift and the strong since women's upbringing taught them only dependence and reliance and in no way fostered originality. But nowadays women are expected to think and act for themselves, and this self-dependence and self-reliance may prove to be the generating spark which will rouse to activity the originality and creative power which, for all we know to the contrary, may long have lain dormant within them.

But in any case this want of creative faculty would not hamper a woman architect. Architecture is a logical art, and no change has taken place in it without a very obvious reason, and when no reason can be adduced for original and capricious designs, such productions are grotesque and not architectural. The truest architects are not distinguished for brilliancy of invention so much as for careful attention bestowed on the smallest details of their work, and women "as a whole" possess the faculty of worrying out details so small that they often are apt to escape the attention of the more comprehensively-minded man.

If I do not stop now you may go away with the impression that I consider women more fitted to practise architecture than men, but nothing could be further from my thoughts, although Sir L. Alma-Tadema told us that the essential element of our art is beauty and that the essential element of beauty is woman.

The Discussion.

In proposing a vote of thanks to the lecturer Mr. Arnold Mitchell observed that art had its limits and so also had sex. In the course of practice the architect had to deal with his client and his builder. From the former he took his instructions and to the best of his ability he endeavoured to carry them out, and up to this point there was no reason that the man should do better than the woman; but there was the contractor to deal with, and it was here that the limitations of sex entered. A woman, for example, might have to go on a building and object to materials. It was a most difficult thing for a man to take orders from a woman—his whole nature seemed to revolt against it—and with the contractor insuperable difficulties would occur. The woman could do the indoor work, but with that her ability as a practising architect ceased. She might achieve success in some particulars, but it was impossible to expect that she would always be successful, and yet that was essential to her practising architecture

THE "APOLLO" TAVERN, TOTTENHAM COURT ROAD, W.
C. FITZROY DOLL, ARCHITECT.

use the necessary amount of strong language to keep the workmen up to the mark. But surely there are other ways of enforcing your will than through the medium of strong language. There is not one man in twenty who has realized that gentleness may be a force. A man will boast of his want of self-control; he flatters himself that abusive language shows himself to be a man of strong character, a master; he would count himself less manly were he less violent, and yet you must confess that some of the gentlest men you know happen to be those who always get their own way and compel people to carry out their wishes whether they will or no. St. Paul's Cathedral, one of the finest examples of Renaissance work we have in England, is a living example of what workmen can produce without the stimulus of abuse. Wren had the "ungodly custom of swearing" in such abhorrence that he posted up an order to the effect that upon sufficient proof the clerk of the works should dismiss any labourer guilty of this crime, and further that "if any master working by task shall not upon admonition reform this profanation among his apprentices,

THE GRAND STAIRCASE FROM THE HALL.

ENTRANCE TO BANQUETING HALL.

HOTEL RUSSELL, RUSSELL SQUARE, W.C.

as a whole. He thought Miss Charles had raised a bogey about the use of strong language by architects to enforce the performance of work; his experience was that architects did not do so.

Mr. Leonard Stokes next spoke. It was not often, he said, that they heard so excellent a paper or one delivered with such sense; lecturers often gabbled out their papers, and that evening they had been taught a lesson. Miss Charles had said that men were responsible for the ugly buildings around us, but she did not say whether, if women were in the same proportion as architects, the ugliness would be any less. He thought however that she had proved a very good case for women to be allowed to try. As regards enforcing the performance of work, persuasiveness (which women possessed) was often as effective as anything else and he did not think it at all necessary to use violent language. At the same time it was difficult to imagine how a woman was to deal with an awkward contractor. Still, she dealt with cantankerous cooks! But there were great difficulties when cockroaches were concerned! She didn't like to put her foot down and that was sometimes necessary with contractors. A woman might climb ladders, but we were not accustomed to it; and though on a large building she might leave much to a clerk of works, on smaller jobs it would be necessary for her to attend to these matters herself; and he did not know whether a basket could always be provided. Even if she managed the scaffold—even if she escaped it—there were the prospects of matrimony. In early life she might study zealously, and then something occurred which upset all other ideas: and after that he did not think she could continue to practise. A woman was expected to look after her husband. It might be too much to expect of her, but so long as this was so he did not know how she was to continue her practice as an architect. One or the other must inevitably go to the dogs.

Mr. R. H. Weymouth did not feel that the paper carried conviction. He agreed with Mr. Mitchell's explanation of the limitations imposed by sex, though he thought that the office work could be admirably done by women; and this perhaps suggested a solution of the diffi-

culty, namely, that such details as cupboards, fireplaces, &c., could very properly be left to women, while the larger and rougher work was done by men. Probably women would do much better than men in decorative work.

Mr. Butler Wilson, president of the Leeds and Yorkshire Architectural Society, thought the criticism had gone away from the high standard set up by Miss Charles. In his opinion it was impossible for one man to cover the whole of the ground in fully carrying out the duties of an architect. This fact had been proved in medicine and was being generally proved in architecture, where specialists were found to be necessary for particular kinds of work: some men built asylums, while others built houses of a character calculated to fill the asylums. He thought there was a field for women as specialists in domestic work. He was rather inclined to think that decoration was the highest form of architecture.

Mr. H. P. G. Maule said the matter was one of personal capacity: if the woman had the desire and ability to practise she could do so, whereas if she failed in this, she simply dropped out; but men should put the opportunity in her way. He thought the Association was to be congratulated on being the first architectural body in this country which had had a paper read before them by a woman. By opening up the study to women they were doubling the chances of securing good work.

Mr. F. T. W. Goldsmith expressed the opinion that no woman would dare to tackle a man on a job beneath the unsympathetic gaze of the clerk of works, though she might do such things very effectively in private. He strongly objected to the proposal to disconnect work done in the office and on the building, as this was contrary to precedent; though if women chose to practise as consulting architects he thought a very large field was open to them. Men did not object to lady architects *per se*, but to incompetent lady architects.

After Mr. F. W. Marks, Miss Maule and Mr. H. A. Satchell had spoken the president remarked that Miss Charles had been through the whole of the students' course, and had passed the Institute examination. As a teaching body the Association was interested in this question. A woman might make architecture her liveli-

hood, and after marriage a supplementary livelihood. We should not forget that it was only during the last fifty years that women had really been educated, and the results at examinations were astonishing. The question before them that evening had been discussed during Mr. Mountford's presidency and it was then decided to allow ladies to enter the classes of the Association.

Miss Charles briefly replied and the meeting then ended.

A FIREPROOF RAILWAY STATION.

THE station at the Dingle end of the Liverpool Overhead Railway, at which the fatal fire occurred on the evening of December 23rd, has now been reconstructed. Between the Hercules Dock and the Dingle Stations there is a tunnel, and it was before the train emerged from the tunnel into Dingle Station that the fire took place, making a furnace of the station and the end of the tunnel, through which blew a westerly gale from the dock end. In the interval the station and its approaches have been reconstructed and improved. As suggested at the Board of Trade enquiry and the inquest on the six victims of the fire, wood and flammable materials have been reduced to a minimum in the refitting of the station. The platform, which was formerly of wood, has been rebuilt with brick side-walls and flagged with specially prepared stone, while certain wooden barriers, waiting-rooms and seats have been superseded by iron ones. The signal-box at the entrance to the tunnel has been rebuilt of brick, and the stairway from the platform to the exits has been roofed in and the sides covered with glass in iron frames. The latter improvement has been introduced in order as far as possible to prevent draught, a very important precaution, not only for the comfort of the passengers, but with a view to dispelling somewhat the force of any gale of wind which might, as on the occasion of the recent fire, sweep up the tunnel from the adjoining docks and fan the flames of any possible outbreak. Besides structural alterations, other safeguards against fire which have been introduced by the Company comprise the

equipping of the whole station with extinguishing apparatus, including two powerful chemical engines placed on the underground platform, and about 200yds. of hose. They are also the first railway company in Great Britain to adopt the May-Oatway automatic fire-alarm, which has been so arranged that should any fire occur in the station or its approaches, either on the upper floor or the underground platform, a simultaneous warning will be automatically signalled to the station officials and the Liverpool Central Fire Brigade. The detecting wires are almost instantaneously affected by the sudden rise of temperature occasioned by the lighting of a small fire, and electric bell-signals are thereby transmitted.

Bricks and Mortar.

APHORISM FOR THE WEEK.

To build a house for oneself is an excellent education in architecture.—J. J. STEVENSON.

Our Plates.

READERS will doubtless note with satisfaction a new feature in this issue—the photo-litho reproductions in the centre plates. Special arrangements have been made for the production of illustrations by this process, and drawings can be rendered by it which it would be impossible to reproduce by the half-tone or line processes. We hope to publish further photo-lithographs as occasion requires. Some particulars relating to Newgate Prison are given in the paragraph below, while reference is made to Siena Cathedral on p. 14 of this issue.

MR. THOMAS W. WALLIS, of Louth, who is termed by a correspondent "the greatest woodcarver who ever lived (not excepting Grinling Gibbons)," celebrated his eighty-first birthday on February 4th. Our correspondent continues: "In the fifties of last century his name was a household word amongst all lovers of art, his wondrous examples of wood-carving—more especially in the shape of groups in still life at the Great Exhibition of 1851—having startled all the world. In 1870 his sight failed him. At present he occupies much of his time in painting in oil. He has recently completed a life-size presentation portrait of Mr. Harry Hems. In 1899 he published his 'Autobiography,' a most interesting and instructive record of early reverses and ultimate success."

THE drawings of Newgate Prison which we publish this week, by Mr. W. Campbell Oman, are of special interest from the fact that this unique building, which exhibits, as Mr. Reginald Blomfield says, "the finest abstract expression of wall-surface to be found in Western architecture," is soon to be pulled down in order to make way for Mr. Mountford's new sessions house. It is interesting to note the pediment over the Governor's residence shown in the sketch on this page. This

pediment no longer exists, as an attic is now in its place; which goes to show that either this drawing is incorrect or that Dance altered his design during the much-needed repairs which he carried out after the Gordon riots. The same may be said of the set-back blank walls over the entrances, as their heights would have to be (according to this drawing) considerably increased to bring them up to their present height. Minor details such as the entrances and niches do not tally with those at present existing.

BURNING OF NEWGATE BY THE GORDON RIOTERS, 1780. (SKETCHED FROM A CONTEMPORARY PRINT.)

With regard to the small sketch in the preceding column, it should be observed that there are now no side roofs, while the flat arched openings with iron bars on the sides and lantern lights over the flat portions are interesting for a similar reason.

The Sieges-allee at Berlin.

THE completion of the Sieges-allee at Berlin, which furnished the German Emperor with a text for one of his most characteristic addresses, is a notable event, and one that should specially interest us while the Victoria-Memorial is in progress. It consists of a series of statues of the various rulers of Brandenburg and Prussia, from the Markgraf Albrecht the Bear to the Emperor Wilhelm I. Each is placed on a semi-circular terrace and flanked with half-length figures of the two leading statesmen of his reign, the whole arrangement being of white marble and forming a long succession of thirty-two groups arranged with geometrical exactitude on either side of a broad road in the Thiergarten. The work is by various sculptors—Walther Schott, Max Unger, Josef Uphues, Böse, Baumbach, Felderhoff, Carl and Reinhold Begas, Kraus, Herter, Von Götz-Schlitz, Brütt, Calandrelli, Lessing, Manthe, Magnussen, Schaper and others. The Emperor is of opinion that this body of Berlin artists is equal in merit to those of the Italian Renaissance, and that strangers are awe-struck by the result of their labours. The total effect is certainly novel, and some few of the groups rise a little above the level of respectable mediocrity, but mainly the effect is that of a somewhat uninspired attempt at realism. The best work is the decoration of the terraces, which have generally been kept rather simple, and in the aggregate make a not unimposing pattern along the sides of the road.

The Fractures at Truro Cathedral.

A MEETING of the Executive Committee was held recently to consider Sir Thomas Drew's report on the fractures in the bases of nave pillars in Truro Cathedral. The following official report has been communicated: "There was a full attendance. Mr. F. L. Pearson, the architect, and Mr. Ward (of Messrs. Willcocks & Co., the contractors) were present. Sir Thomas Drew's report was read. The details of this are at present confidential and will not be published until the General Committee have received it. But permission is given to quote the following: 'My general impression is that the magnitude of the occurrence of such fractures as these should

not be overrated, nor should they cause anxiety. Such unlooked-for occurrences are incidents in carrying out many building contracts, which are not heard of and are of no outside interest, and are set right, and are to the builders a vexation, not an anxiety.' No immediate steps need be taken, but the contractor has been desired to furnish an estimate for the removal of one of the bases of the piers in order that the knowledge of the causes of the fracture may be arrived at by actual inspection, and not rest only on theory."

Leeds Architects' Dinner.

THE LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY held its annual dinner last week. Mr. Butler Wilson, the president, was in the chair. Mr. John Hepper proposed the toast of "The Royal Institute of British Architects and Allied Societies." The president, who responded, briefly alluded to competitions. So long as architects had to start without clients, they must continue to go on the market and find a start in life in the competition world. But they had a right to expect that the assessors in these competitions should be men who had had a practical experience in the particular class of buildings that was under consideration, otherwise their awards could scarcely give general satisfaction. There was to-day a very strong movement in the direction of dealing with architectural problems in a quiet manner, and with a consideration for the requirements of their clients, without any regard to style or period. The advanced school had carried out this idea to an extreme degree. It appeared to him unreasonable that men should be asked to forget the architectural beauties of Yorkshire, for example. They must not be asked seriously to ignore the great store of knowledge which the world had placed at their disposal. There was no reason why they should not store themselves with this knowledge and, at the same time, be prepared to deal with every architectural question put before them strictly on its merits. Alderman Wurtzburg gave "The Leeds and Yorkshire Architectural Society," and Mr. G. F. Bowman responded. In giving the toast of "The Guests," Mr. W. H. Thorp deprecated the evils that the competition system brought with it. Architects were put to a great deal of expense, and with no return in the majority of cases. He suggested that the evil might to a certain extent be minimised if a system of limited competition were adopted by which, say, half a dozen members of the profession would be invited to send in plans, the unsuccessful competitors to receive an honorarium for their work.

Masters and Men.

The Glasgow Plasterers' Strike has been settled. The masters at a meeting last week agreed to concede the demands of the operatives, and to raise the rate of wages from 9d. to 9½d. per hour.

Master-Builders in the Stourbridge District have given the bricklayers and carpenters notice of a reduction of ½d. an hour in wages. The carpenters ask for an advance of ½d. per hour. The building trade has not been active, but the trade has been helped a little by a reduction in the price of bricks of 2s. 6d. per 1,000.

The Plasterers of Swansea have given notice for an additional ½d. per hour, which will terminate next May. Meanwhile the master-builders, who are now members of the Master-Builders' Association, have submitted to their organization a new code of rules, which fixes the plasterer's wages at 8d. per hour, these rules being given as a counter offer to the men.

The Maidstone Building Trade Dispute.—Mr. G. R. Askwith, who was appointed by the Board of Trade to act as arbitrator in the dispute between the masters and men engaged in the building trade in Maidstone as to the hours of labour, has given his award. The masters had made a new rule to the effect that the men should commence work during the months of December and January at 8 o'clock in the morning and continue working without any break till the dinner hour, and the arbitrator decides in their favour in regard to this. The men, however, succeed in their contention, which was a vital point with the carpenters and joiners, that the

rate of pay for overtime should commence after an ordinary day's work instead of after a ten-hours day as proposed by the Masters' Building Association. The lock-out, which has lasted some six weeks, is now at an end.

Leeds Building Trades Protest against the "Go-Easy" Charges.—At a crowded meeting recently convened by the Leeds Building Trades Federation a resolution was passed protesting against the articles published in the "Times" and other newspapers "to prejudice the public against the workers in the building trades by stating that the trade unions are responsible for the high cost of buildings by a system of organised idleness. Such statements are not facts, and are made with the sole intention of damaging the workers in the minds of the public, answers to them by workers and others defending unionism being so cut up by the Press that in nearly every case the writer does not recognise his own production. This meeting pledges itself to use all legitimate means to counteract the same by circulation to the public of indisputable facts."

COLOUR IN DOMESTIC DECORATION.

AT the Durham College of Science, Newcastle, last week, under the auspices of the Northern District of the Incorporated Institution of British Decorators, Mr. George C. Haité, president of the Society of Designers, delivered a lecture on "Colour, and its Application to Decoration," which was the concluding address of a series on decorative art in relation to house ornamentation delivered in the Midlands, and reported in these columns. Mr. Haité

said there were two systems of decorating ceilings. One was the hand-decorated ceiling, in which every possible outrage that could be imagined was perpetrated, and would continue to be perpetrated. In decorated ceilings by mechanical or manufactured decoration there was not the same possibility, and he was glad that it was so. Figures of human beings should not be used in the decoration of ceilings under any consideration whatever. He had had the Sistine chapel suggested to him as an instance to the contrary; but he believed that Michael Angelo, who painted that ceiling, would have protested, and did protest, against placing the human figure in positions in which it could not possibly be seen, unless they lay on their backs in the centre of the room, or at one particular point. As regards ceilings decorated by the aid of manufactured material, it was not by the mere application of the material, but by its use and adaptation that a decorator deserved the name. A completely satisfactory decorative effect would be practically impossible unless the ceiling were decorated or coloured. If the ceiling be left white, it set up discords, instead of being in harmony. In his opinion, strong colour could be used more satisfactorily on the ceiling than on any other portion of the room, inasmuch as it had no background, no pictures and no furniture. After speaking of colour and colour theories, Mr. Haité said he objected to varnishing, and said that decoration might best be keyed up by making the doors or overmantels brilliant in colour. A colour should not be too pronounced; it was objectionable to have four or five colours announcing the fact. Decorators would find that they could often pull a scheme of colour together by the various colours so designed that they appeared to the

THE SOUTH WALL, NEWGATE, FROM OLD BAILEY.

observer to be a single colour. He spoke of the excellent influence of colour upon national character. Good colouring would dissipate half the worries that troubled people, which would seem trivial and unimportant. Depression was caused by the leaden hue of the skies and the monotonous grey of the streets. The introduction of trees into the thoroughfares of our cities had increased the joyousness of life and given us a greater and wider sense of beauty. He pleaded for tessellated tiles, and for coloured glass and bricks in façades of buildings. He pleaded also for colour in dress. Colour should be broken by colour, and not by neutrals—not by gold, silver, black or white. As photography was neither an art nor a science, but a connecting link between the two, so decoration might be said to be the connecting link between architecture and painting. It was both an art and a craft. It required many qualities, depending as it did upon construction for its existence and relying upon the treatment and selection of colour for its satisfactory expression.

Keystones.

Old Gateway in College Street, York.—The drawing of this gateway on p. 443 of our last issue was by Mr. W. Ainsley, not "Ainsler" as printed.

A New Volunteer Drill Hall at Twickenham has been opened. The building is a substantial brick structure capable of seating 600 or 700 persons.

St. Matthew's Church, Bayswater, has undergone several important additions within the last few weeks. These include an altar rail with ten massive brass standards, an oak altar table and carved platform, and a sanctuary carpet, as well as umbrella holders throughout the church.

An Important Archaeological Discovery has been made at Mount Jener, near Guéret. About two yards under the surface an excavating party came on a fortified Gallo-Roman camp in excellent preservation, three buildings, almost intact, enclosing funeral urns, pottery, bones, money and medals.

Mr. John Cresswell has resigned his position as county architect to the Northumberland County Council. He was led to this step by the feeling that he was no longer physically competent to perform the increasingly arduous duties of the office. Mr. Cresswell had been county architect for twenty-three years.

A Sheffield Memorial to Queen Victoria.—The movement for perpetuating the memory of Queen Victoria in Sheffield took final form last week, when the design of Mr. Alfred Turner, of Kensington, for a bronze statue on a stone pedestal was accepted. The memorial is to cost something over £3,000, and is to stand on an open space opposite the Town Hall, now occupied by a monolith erected in the Jubilee Year. This is to be moved, probably to one of the parks.

Westminster Abbey Fees in connection with the Ruskin medallion, as stated on p. 456 of our last issue, amount to £201 1s., which is not far short of the cost of the medallion itself. It appears that these fees are made up as follows:—One guinea goes by custom to the Clerk of the Works, who superintends the fixing of the monument; and £200 is placed to the Fabric Fund, this, too, in accordance with custom. The rapid deterioration of the fabric which is caused by the London atmosphere throws a burden upon the funds at the disposal of the Chapter which is all too heavy for them.

A Stockport Competition.—The Town Hall Committee of the Stockport Corporation have offered five premiums to the architects competing with designs for the proposed new town hall. The premiums are to be awarded according to the merits of the designs as determined by an assessor, namely, (1) £100, (2) £75, (3) £50, (4) £50, (5) £50. The president of the Royal Institute of British Architects has been requested by the town clerk to advise the Corporation in the appointment of a professional assessor to adjudicate upon the designs sent in. The Committee has expressed the opinion that a sum not exceeding £60,000 should be the limit of expenditure on the erection of the new town hall.

New Wesleyan Schools at Witton have been opened in Griffin Street.

A New Workhouse Infirmary at Rochdale has been erected at a cost of £26,000. The architect is Mr. Butterworth.

A New Lych-Gate for the parish churchyard of Walford-on-Wye, near Ross, has just been completed in memory of the Rev. G. Robinson Kewley, who was vicar of the parish from 1884 to 1887.

A New Free Library was opened last week as a memorial of Queen Victoria's Diamond Jubilee at Wolverhampton. The building has been erected from the plans of Mr. H. T. Hare, of London. The old free library buildings are to be used as a technical school.

New Municipal Buildings at Llandudno have been opened. The site was given by Lord Mostyn in commemoration of the completion of the sixtieth year of the reign of Queen Victoria. The buildings were designed by Mr. Silcock, and the cost of construction will amount to about £23,000.

The University Correspondence College Calendar, 1901-1902, has just been issued by Mr. W. B. Clive, price 1s. nett. During the year ending August 31st last 926 students of this college passed the London University examinations; in fact, the number of successes of the College at London University has increased nearly 30 per cent. during the last six years. At M.A. 1901 the students formed exactly one-half of the Pass list.

Additional Inspectors of Buildings in Manchester.—The Improvement and Buildings Committee of the Manchester City Council have appointed a buildings inspector to fill a vacancy recently occurring. There are only three inspectors in Manchester, whereas in Sheffield there are eight and in Liverpool eleven. The opinion was expressed that until it will be definitely known whether or not the township of Stretford is to be incorporated in the city it would be inadvisable to make further appointments at present.

Mr. James Stevens, F.R.I.B.A., died recently at the age of seventy-five. For over forty years he carried on business in Manchester. Many important warehouses and hotels in the city have been built from his designs, whilst at Macclesfield most of the public buildings are his work, including the free library, the school of arts, the infirmary, the technical school, the industrial school, and the more recent part of the town hall. Very recently, too, he designed the Crewe technical school. Mr. Stevens was a past president of the Manchester Society of Architects.

The New Buildings of the Leeds Trades Council in Upper Fountains Street are now approaching completion. The buildings, which are being erected by the Leeds Builders Company, according to the designs of Mr. W. S. Braithwaite, architect, comprise a large hall capable of accommodating 450 people, a smoke-room and bar with a billiard-room, reading-room, lodge-rooms and offices. The adjoining building, occupied by the National Union of Boot and Shoe Operatives, also forms part of the Trades Council premises, and will shortly accommodate the Gasworkers and General Labourers' Union. The new buildings, which are constructed of brick with stone dressings, will cost some £6,000.

A New Town Hall at Thetford has been erected from plans by Mr. H. J. Green, A.R.I.B.A., of Norwich. The front elevation is from the Market Place, and there is also an elevation from Cage Lane. The stone work throughout is of Ketton stone, and outside white Cossey bricks are conspicuous. Messrs. E. Wilmott & Sons, of Cambridge, have been the principal contractors for the building. The sub-contractors include—stonework, Messrs. R. Hall & Son, of Thetford; plastering, Mr. W. G. Crotch, of Norwich; ironwork and hot-water fittings, Messrs. Barnes & Pye, of Norwich; clock, Mr. W. H. Harris, of Thetford; county court fittings, Messrs. Trevor, Page & Co., of Norwich; mosaic work, Mr. J. F. Ebner, of London; electric lighting, Messrs. D. Brown & Co., of Newcastle-on-Tyne; ventilating pipes and details, Exors. of the late Mr. W. Clarke, of Thetford. The gross total cost, including architect's fees, clock, electric lighting, and other accessories has been estimated at £10,000.

An Architect's Bankruptcy.—In the Birmingham Court of Bankruptcy last week Mr. Herbert J. Greatrex, architect, of 121, Colemore Row, Birmingham, was adjudicated a bankrupt.

Mr. Edwin B. B. Newton, F.S.I., A.M.I.C.E., F.G.S., has been promoted from the position of assistant surveyor to the Paddington Borough Council to that of borough surveyor.

The Theatre of Merida, Mexico, is to be decorated with large paintings by M. Guidi representing "Mexico crowned by Progress—accompanied by a Cortège of the Arts and Sciences, Industries and Commerce."

The Church of St. Martin's-in-the-Fields is likely to be the city church for Westminster, at which the mayor, aldermen and councillors will have seats. The church, by Gibbs, dates from 1721.

Mr. E. W. Barnes, architect, of Guildhall Chambers, Broad Street, Bristol, died recently at the age of fifty-seven years. Mr. Barnes was a member of the Bristol Society of Architects and a Fellow of the Royal Institute of British Architects.

Mr. Hugh Stannus, director of architectural studies at the Manchester Municipal School of Technology and the School of Art, lectured last week on architectural history in the new school in Whitworth Street. This was the first public event which took place there.

Progress of Piccadilly Widening.—The London County Council hopes to complete the widening of Piccadilly about the middle of next month. Since the amended scheme received the sanction of the Crown, the Council has pushed forward the work with alacrity, and practically all that remains to be done now is to complete the surface of the new roadway that is to form part of Piccadilly and to plant the proposed new trees.

Bristol Society of Architects.—At the meeting of this Society held last week, Mr. Frank W. Wills (president) in the chair, a paper was read by Mr. Alfred H. Dykes, A.M.I.C.E., M.I.E.E., of Westminster, on "Electricity as applied to Buildings." The lecturer confined himself principally to the consideration of the alterations in the design of factories and works necessitated by the increasing use of electrical energy, and he also spoke of the systems of distributing current inside buildings.

The Competition for a New Art School at Hull, to be erected at a cost of £12,000, has been decided. No fewer than eighty-seven sets of plans were sent in. Mr. Sydney R. J. Smith, London, the assessor appointed to adjudicate, has given his award as follows:—1st, Messrs. Lanchester, Stewart & Rickards, 1, Vernon Place, Bloomsbury Square, London, W.C.; 2nd, Messrs. Spencer W. Grant & James A. Bowden, Moorgate Station Buildings, 63, Finsbury Pavement, London, E.C.; 3rd, Mr. F. J. Smith, Parliament Mansions, Victoria Street, Westminster, London, S.W. The Art committee, before formally adopting any of the plans from which the new school will be built, have decided to have an interview with the winners of the first premium.

"Notes on Some Yorkshire Churches."—This was the title of the lecture which Mr. Charles Hadfield, F.R.I.B.A., delivered last Thursday before the Sheffield Society of Architects and Surveyors. After referring to the parochial system which followed on the great changes after the reintroduction of Christianity in the seventh century, Mr. Hadfield proceeded to notice the following parish churches:—Rotherham, Treton, Handsworth, Aston, Ecclesfield, Sheffield and Laughton-en-le-Morthen. He gave outlines of their history from Domesday and other sources, and described by aid of plans which he had prepared the date and mode of their construction. The surveys of most of them were prepared during works of repair done by himself during the past thirty-five years. The influence exercised upon the art of the district by the great Archbishop Scott of Rotherham, a native of either Rotherham or Ecclesfield, was pointed out, and allusion was made to his college at Rotherham and his work in rebuilding the church there.—In the course of the evening it was announced that the R.I.B.A. prize drawings would be on exhibition at the Howard Art Gallery from February 25th to 28th inclusive.

Correspondence.

Architectural Examinations.

An architect having written to Mr. Seth-Smith, the president of the Architectural Association, for his opinion on an examination recently instituted by the Society of Architects, that gentleman has replied by the following letter:—

February 3rd, 1902.

My dear Sir,

As to the Society of Architects to which I at one time belonged. It had a mission, namely, that of calling the attention of the profession and the public to the need (in its judgment) of the legal protection of the title of "Architect," and of compelling those who in future aspired to the calling to have gone through proper and sufficient training.

The first principle the Council originally laid down was that the Royal Institute of British Architects was the proper examining body and that in any Bill it (the Society) advocated the Institute should be the sole examining body for England. On these bases I supported the movement, for the reason that the Royal Institute of British Architects in their new charter had apparently ignored or abandoned this broader policy, the only policy which, to my mind, can secure to our profession its due status or to the Royal Institute of British Architects its widest usefulness.

When, however, some eight or more years ago the Society of Architects launched a scheme for examinations of its own, after using all my powers of persuasion to no avail, I was obliged to resign my membership, and I shall continue to oppose the policy it is pursuing by every possible means, excepting that I am, of course, as strong (and even stronger) an advocate of the legal registration of every properly-qualified architect as ever I was, and am pleased to notice how rapidly the necessity for something of the kind is forcing itself on the minds of most architects.

I am, dear Sir,

Yours very truly,

(Signed) W. H. SETH-SMITH.

Engineering Notes.

The Isolation Hospital, Maidenhead, is being warmed and ventilated by means of Shorlands' patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The E.L.E. System of Electric Lighting.—In answer to the numerous communications received, the directors of Electric Lighting Boards (British Manufacturing Co.), Ltd., request us to announce that all enquiries, correspondence, &c., should be addressed to the head office at No. 7, Pall Mall, London, S.W., and addressed to the Company as distinct from individuals.

"Tube" Vibration.—The report of Lord Rayleigh, Sir Wolfe Barry and Professor Ewing, the Committee appointed by the Board of Trade to enquire into the cause of the vibrations in adjacent buildings made by the Central London Railway, refers the cause to the magnitude of the load, 8 tons, carried on each of the 4 axles of the locomotives, making 32 tons in all, unrelieved by springs in order to obviate the necessity for gearing, and to the unevenness of the surface of the rails. They conclude that if a method of driving is adopted by which the unsprung-borne load on the axles is reduced to a small quantity a practically complete cure will be effected. The motor-cars were found to have an advantage over the locomotives. They recommend that in new undertakings sufficient room should be allowed for the introduction of a deeper rail.

The New Rodin Pavilion at Meudon, though built with the materials of the old one, is somewhat different in design from the gallery so well known to visitors to the Paris Exhibition. The old entrance has been replaced with a strong colonnade in the Louis XIV. style, and the rotunda has given way to a rectangular vestibule. The "Porte de l'Enfer" done for the Musée Galliera and rejected will find a corner in the pavilion.

Builders' Notes.

Mr. George Rae, builder, of Balmedie, died last week in his seventy-fifth year.

The Master-Builders' Association of Ireland held its annual dinner recently. The president, Mr. J. Beckett, occupied the chair.

Mr. Frederick Thorn, who for many years carried on the business of a builder and decorator at Portsmouth Road, Long Ditton, died recently at the age of fifty-seven years.

The Edinburgh and Leith Master-Builders' Association held its annual meeting last week. The following office-bearers for the ensuing year were re-elected:—President, Mr. Robert Lamb, builder; vice-presidents, Mr. Patrick Knox, plumber, Mr. M'Leod, builder, and Mr. Alexander Calder, joiner; secretary and treasurer, Mr. John Nicol.

The Portsmouth Master-Builders' Association held its annual meeting recently, Mr. W. J. Light presiding. Mr. Light was re-elected president, Mr. W. W. Evans was re-elected vice-president, Mr. Henry Jones treasurer, and the following as committee:—Councillors Dye and Porter, Messrs. James Crockerell, J. W. Perkins, H. G. Wilkins, G. R. Chamberlain, G. J. Davis and A. Spriggs. Messrs. E. Bradshaw and J. Harding were elected auditors, and Mr. Frank J. Privett was re-elected secretary.

The Hull Branch of the Yorkshire Federation of Building Trades' Employers held its annual dinner last week. The chair was taken by the president, Mr. E. Good. Mr. J. Watson (Hull) said, in reference to the depression in trade, it would be better, instead of decreasing wages, to weed out the inferior workmen. Mr. J. Dawson (Huddersfield) said the Yorkshire Federation had long ago passed a resolution asking its members not to reduce wages unless they were absolutely forced, but to try to do away with those restrictions the men demanded of them by their interference with the liberty of action.

London County Council.—At last week's meeting of the Council the Water Committee brought up their report on the London Water Bill and recommended (a) that the interests of the people of London ought not to be entrusted to a Water Board nominated by seventy-eight different authorities and independent of public control: a recommendation which was adopted on a division. It was further resolved: "(b) That it is inexpedient and dangerous that a Board constituted as proposed should have the power to decide by agreement what sum shall be paid to the companies, or that it should have the right of creating debt or of levying rates on London. (c) That the Council should endeavour to obtain such amendment of the financial provisions of the London Water Bill, 1902, as shall make it clear that the award of the arbitration tribunal is to represent the fair and reasonable value of the undertaking, and is to be determined as a sum of money."—Mr. Austin asked the chairman of the Finance Committee whether an offer had been received from a contractor to undertake the jobbing works of the Council at 1½ per cent. below the present schedule price. Lord Welby said that something in the shape of negotiations had taken place as to whether such an offer might be entertained. He did not like at the present moment to say that such an offer had been actually made. Mr. Burns, M.P.: In the event of such an offer being made I suggest that before accepting it the Finance Committee take steps to enquire whether the offer was a *bona fide* one and if the loss, if any, is not guaranteed by a pool of master-builders who want to break up the Works Department. Lord Welby was understood to reply that the *bona fides* of any contractor making such an offer would be the subject of enquiry.—A report from the General Purposes Committee recommended: "(a) That an advertisement be issued inviting applications for the appointment of manager of works, and that the salary to be attached to the position be £1,500 a year as at present; (b) that a standing committee, consisting of seven members, be appointed for the supervision of the Works Department and that such committee be styled the Works Committee." The discussion on these matters was postponed.

The L.C.C. Works Department.—Mr. William F. King, president of the London Master-Builders' Association, denies that builders have formed a

pool to guarantee a contractor against possible loss in the event of the jobbing work of the L.C.C. being placed in his hands. No action, he says, has been taken either by members of the Association or by any ring of builders with a view of influencing the contracts of the L.C.C. or of its Works Department in any way at all. Some years ago the Association certainly gave an opinion that the L.C.C. could not successfully conduct a Works Department except at great loss to the ratepayers, and this opinion appears to have been justified, otherwise they had always recognized the L.C.C. Works Department as a building firm and have assisted them on many occasions with technical information.

New Patents.

These patents are open to opposition until March 22nd.

1901.—Fanlight Openers.—3,412, R. ADAMS, 67, Newington Causeway, London, S.E. An arm is fixed to the frame of the fanlight and is pivoted at its outer end to a right-angled lever. One end of this latter is arranged to slide in a slot, or in a slotted bar fixed to the sash, and the other end is suitably connected to a vertical operating bar fitted with screw gear.

Safety Gear for Electric Lifts.—4,123, C. W. HILDRED and R. WAYWOOD & Co., LTD., both of Newington Iron Works, Falmouth Road, London, S.E. The gear is double acting. It is automatically brought into play if the cage or balance-weight meets with an obstruction, causing the ropes to become slack, or in case they break; and the device is also designed to be brought into action should the cage go too fast, when the circuit is broken and the motor stopped, and in some instances bringing safety catches into operation.

Woodite.—17,431, W. WOOD and H. BARTLETT, both of Mitcham, Surrey. Woodite consists of—washed Para rubber, 80 parts; fucus vesiculosus, 10; wood pulp, 5; and mastic or resin, 5. Sulphur is added for vulcanising.

The following specifications were published on Thursday last, and are open to opposition until March 29th. The names in italics are those of the communicators of the inventions. A summary of the more important of them will be given next week.

1900.—23,462, WAYSS & FREYTAG, moulding machine for electric conduits.

1901.—1,070, SCOTT-MONCRIEFF, sewage distributing apparatus. 1,552, OLDFIELD & SCHOFFIELD, planing, shaping and other machines having a quick return. 2,230, SCHINZER, disinfecting apparatus for water-closets. 4,033, HADDAN (*Stigler*), controlling apparatus for electric lifts. 4,537, DUNBAR, FORD & FORD, water-closets. 4,742, BLADON, ventilators. 4,756, GILBRETH, concrete mixing apparatus. 5,758, DISS, pug-mills. 5,952, HIRST & BACON, water-tight cover for electric cut-outs, joint boxes, &c. 6,255, CULVER, taps. 10,831 FISCHER, pipe connections. 10,937, WORTHINGTON, latch lock for gates. 13,022, BOMMER, spring hinges. 16,249, STEPHENSON & ROBINSON, overflow and discharge wastes for lavatory basins, baths, &c. 20,896, BRICE, kilns. 22,909, BOLLE (*Lagino*), erecting jointless walls. 24,139, SCHECK, roofing sheets. 24,184, CRACOANU, fireproof floors. 24,292, ATCHER, cramps. 25,316, BENNETT, tiles for floors, walls, &c.

A Baptist Church and Schools at South Bank, Yorkshire, is to be erected, and the designs submitted by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines have been accepted. The accommodation provided in the church is for 542 adults. The estimated cost is £4,380.

The Monument of Bossuet which is to be erected on the site of the now ruined choir of the church of St. John, Dijon, will represent the orator in an attitude serene and dignified rather than declamatory. M. Paul Gasq is the sculptor. The subject will be supported by the two allegorical figures of Eloquence and Faith on which M. Mathurin Moreau is now engaged. The whole work will be executed in the fine warm-tinted stone of the country.

Law Cases.

A Morecambe Architect's Claim.—At the Manchester Assizes last week Mr. Justice Bucknill heard an action in which Mr. Herbert Howarth, architect and surveyor, of Morecambe, sought to recover from Messrs. John Gardner and John Scott, proprietors of the Alhambra Palace, Morecambe, £379 6s. 8d., balance of an account for services in connection with the erection of the Alhambra. The defence was that the plaintiff did not render certain services for which he claimed, that the commission to which he was entitled, and which he had been paid, was 5 per cent. on £22,581 10s. 6d., and not upon £25,799 which the plaintiff claimed. Negligence was also alleged, and for this £230 was claimed. Mr. John Scott, builder, Morecambe, and one of the defendants, said he and his partner declined to pay the plaintiff any commission on the electric light, decorations, colouring and gilding, plastering, draperies, seats, and so on, because he had nothing to do with the work. Mr. Gardner, the other defendant, was unable to attend, and his Lordship adjourned the case *sine die* for his attendance, the costs of the action occasioned by his non-attendance to be paid by the defendants' solicitor to the plaintiff's solicitor forthwith.

An Important Point in regard to Building Frontages.—At the Bristol Police Court last week the case of the *Bristol Corporation v. the Bristol Brewery Co.* (Messrs. Georges & Co.) was heard. The action arose through the defendants having omitted to rebuild the front of a public-house, known as the Jolly Colliers, in West Street, Bedminster, after pulling down a portion of it, in accordance with the provisions of the Improvements Acts, 1840 and 1847. In delivering judgment Mr. G. E. Davies explained that the alterations had given the Corporation the right to demand that the premises should be pulled down and rebuilt to a certain line laid down by the city surveyor. They found that such demand had not been complied with. The principal question to be decided was whether the stone window sill which was removed constituted any part of the front or external wall, gable or outer boundary of the premises. In determining that point the magistrates did not consider themselves helped in the slightest degree by the opinions of expert witnesses, as gentlemen of equal standing gave contradictory opinions in the witness-box, according to the side which called them. After viewing the premises, they had come to the conclusion that the sill must be considered part of the front or external wall. They were therefore of opinion that such alteration was made to the external wall as would give the Bristol Corporation the right to demand that the owners should set back their premises in the manner demanded. They did not think that the defendants intended to give instructions that the sill should be removed, but their instructions on that point were not explicit. Under these circumstances, although they had given judgment in accordance with law, they thought it bore with great hardship upon the defendants, and the justice of the case would be fully met by inflicting upon them a fine of 6d. Leave to appeal was granted.

Stonehenge is proposed to be acquired as a national monument. The Wiltshire County Council make this recommendation to the Government and state that they are willing to undertake the guardianship.

Indian Archaeology.—Mr. J. H. Marshall has been appointed Director of Archaeology in India. A Government resolution announces that an annual provision of one lakh of rupees will be made for the preservation of ancient monuments, and urges that the provinces should also fix annual payments for this purpose.

A New Isolation Hospital is proposed to be erected at Meltham Moor, Huddersfield, and a Local Government Board enquiry was held recently by Mr. F. St. George Mivart, M.D., the Board's inspector, into an application of the West Riding County Council for sanction to borrow £23,744 for the purpose. Mr. Joe Berry, architect, has prepared the plans.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Right of Surveyors to Dispose of Plans.

MANCHESTER writes: "If an architect sends to a district council a set of plans with his name on them and both his own and the client's on the building form, has the surveyor any right to give those plans to the client, if he should call at the council's offices and say he did not want them to be passed?"

The surveyor has no right to hand over the plans in the way you mention and you can sue him and the client for the recovery of the plans. The client must also pay for the work done.

"Goodwill" of Architect's Practice.

YORKSHIRE writes: "A local architect just deceased has left his practice in the hands of his executors. Deceased has a son in practice in Yorkshire, who is considering whether to combine this with his own practice or not. In case he declines to take the deceased's practice, I have the option of stepping into it. Is there in the profession the equivalent to the commercial 'Goodwill,' and on what basis should the value of such a transfer be made?"

The goodwill is usually taken at three years' purchase for that portion of which the clients are regular customers for fresh work. The commissions which depend upon an architect's personality or influence are valueless to another. The valuation is somewhat difficult, and differs in each case; it is best, therefore, to engage a professional valuer.

Deductions from Account and Charges for Extra Material.

IPSWICH.—W. H. D. writes: "(1) Can an architect deduct anything for inferior joinery work, if he has allowed it to remain in the building? (2) Can I charge for 200ft. cube of timber used in excess of the quantity in the bill of quantities, which was prepared and supplied by the architect himself? The contract I signed was that agreed on by the Master-Builders' Association."

(1) The contractor must accept whatever the architect deducts or he can be ordered to replace it according to the contract. (2) If the timber was shown on plans or stated in the specification, or was necessary to the due completion of the work, you cannot claim anything. If you have given a clean receipt (without proviso) in full settlement of account we cannot see how you can reopen the question.

Right to make Openings into Lane.

TREHARRIS.—OLD SUBSCRIBER writes: "A. is the lessee of a plot of land (possession of which he has had for fifteen years) which is situated on the boundary of property composed in an estate. The adjoining land was undeveloped at the time the lease was granted, and remained so for many years after. Subsequently the adjoining land in question was developed, and for the purpose of such development a 'back lane' was constructed immediately adjoining A's boundary wall. The lane is publicly used, although constructed for the benefit of the occupiers of the houses built on the adjoining estate. It has not been taken over by the local authority, although its construction was sanctioned by them. Can A. make an opening in his boundary wall giving ingress and egress to and from the lane? Can the lessors or any of the lessees of the adjoining estate obstruct his right to make such an opening?"

I gather from your statement and the accompanying diagram (not reproduced) that the passage marked "lane" "is publicly used." From this and the fact that there is no gateway in any way shutting it off from the public highway of which it apparently forms a part I infer it has vested in the local authority as a public

thoroughfare or right of way. If my inference is correct I see no objection whatsoever to A. making an opening in his boundary wall giving ingress and egress to and from the lane, and under the circumstances I have pointed out the lessees of the adjoining estate can in no way hinder him. Although you state that you have been in possession of the plot for fifteen years, yet you do not say whether or not you have during the entire (or indeed any) portion of that period exercised rights of ways over the ground now occupied by the lane.

W. JOHNSON-ROBERTS.

St. George's Hall, Liverpool.

LONDON, S.W.—H. S. writes: "Have any plans been published of St. George's Hall, Liverpool?"

I believe that the plan and an elevation of St. George's Hall, Liverpool, were published with the second volume of "The Civil Engineer and Architect's Journal" in 1839 by J. Weale, publisher, 59, High Holborn, whose business I understand is now carried on by Mr. B. T. Batsford, 94, High Holborn. But perhaps a more readily obtainable work would be "The Stranger's Guide to Liverpool," by David Thompson, M.D., and published by Messrs. Ward Lock in 1854. This gives a plan and perspective view of the Hall, with a short description; it was published at 1s. 6d. Both these works, together with numerous plans and tracings, are to be seen at the Royal Institute of British Architects, Conduit Street, W.

G. A. T. M.

Open Timber Floor.

LONDON, W.C.—E. B. M. writes: "Kindly describe how an open timber floor plastered between the joists is constructed. I want it as thin as possible consistent with strength. Several architects advise the joists and beams to be laid flat. Would this give sufficient strength?"

The strength of a loaded beam such as a joist or girder varies directly as the breadth and inversely as the length. The depth is therefore the most important part, and no practical architect could advise joists being laid flat. The proportion for joists and beams with the minimum amount of material will depend upon whether strength alone is considered or strength combined with stiffness. If the breadth of a beam exceeds half the depth it will not be an economical distribution of material for strength, and if it exceeds one-third of the depth it will not be economical for stiffness. Generally, market sizes have to be used leading to the use of 7 by 2, 9 by 3, 11 by 4, &c., but where it is desired to keep the floor thin the depth is reduced and the breadth largely increased. For instance, 7 by 2 joists have a comparative value of $2 \times 7^2 = 98$, with a section of 14 sq. in., while 6 by 3 joists have a comparative value of $3 \times 6^2 = 108$, with a section of 18 sq. in. and 98 : 14 :: 108 : 15.43, showing a loss of $100 \times \frac{108}{15.43} - 100 = \text{say } 16\frac{1}{2}$ per cent.

Beams are as a rule made much wider in proportion than joists in order to save depth, but the same theoretical objections apply. In the case given the area supported by each beam is say 14ft. 6in. \times (5ft. 9in. + 3ft. 3in.) = 130.5 sq. ft., which at $\frac{1}{4}$ cwt. per sq. ft. total load = say 163 cwt. distributed. The formula for safe distributed load in cwts. on a beam is $w = \frac{bd^2}{L}$, therefore $163 = \frac{bd^2}{\text{say } 15}$, or $bd^2 = 163 \times 15 = 2445$. Suppose the depth to be 12in., then the breadth will equal $\frac{2445}{12^2} = \text{say } 17\frac{1}{2}$ in., which

would be extravagantly out of proportion. Taking a depth of 13in. the breadth would be $\frac{2445}{13^2} = \text{say } 14\frac{1}{2}$ in., so that a piece of whole memel 13½in. sq. would be suitable and would have the adzed faces preferred for such work. Assuming the joists to be 15in. centre to centre, each one would have to carry over the centre span $11.5 \times 1.25 = 14.375$ sq. ft., or say 18 cwt., and would require a scantling of $bd^2 = 18 \times 11.5 = 207$, which would be provided by joists 7 by 4½ or 8 by 4. To carry the soffit, plastering fillets may be nailed to each joist and laths to the

HENRY ADAMS.

Covered Passage on First Floor.

LONDON, W.—B. P. writes: "A staircase in a house needs to be connected with a side wing. It is proposed to throw a passage across the yard beneath, leading from the old staircase window. Would a 9 by 3 wood joist be strong enough spanning across the 12ft. yard, built into the wall of the side wing, and resting on a 9 by 4 post which is let into the cement of the yard beneath and is bolted to a cross piece (9 by 3) let into the main staircase wall? Would the post require any foundation, and what would be the simplest mode of making a water-tight joint, as it passes through the slate roof of an outhouse beneath? I enclose sketch (not reproduced)."

The post for supporting this passage should be not less than 9 by 6 and rest upon an oak sill about 9 by 3 and 3ft. long. The proposed 3 by 9 joist for carrying front of passage should not be less than 9 by 6. The 1½ in. flooring would carry itself across 3ft. 6 in. span without joists, but there would then be some difficulty with the top step for landing which projects into the passage. This could be arranged by a trimmer bolted to wall with distance pieces on each side to set it back to clear the top riser. A water-tight joint can easily be made where the post passes through outhouse roof by 5lb. sheet-lead flashing, the lead being carried under the slates on the upper side. The roof of passage may be 1½ boarding covered with lead or zinc. The fillets

shown on existing transom of window will do if the wall plate carrying roof is continuous past the window and door openings.

HENRY ADAMS.

The Cause of the Belfast Mill Disaster was stated at the inquest held last week to be due to the collapse of two brick piers which rested on the ground floor and supported the upper structure.

Garden Shelter and Lily Pond, Biddenham.—The pond shown in this design was omitted in the completed scheme. It was intended to be placed between the tennis lawn on the right and the kitchen garden on the left, the arched openings in the yew hedge leading to these parts.

GARDEN SHELTER AND LILY POND, BIDDENHAM. C. E. MALLONS AND GROVER, ARCHITECTS.
DRAWN BY F. L. B. GRIGGS.

Views & Reviews.

A New Art Journal.

"The Art Workers' Quarterly," the first number of which has been issued, is primarily intended to supply full-sized working designs to craftsmen who do not design their own productions; and also to supply those who may have some knowledge of the principles of design with specimens of sound and wholesome ornamental work from the best historical and contemporary work. The plates presented with the first number include some of sixteenth- and seventeenth-century examples of Italian lace work and leather work, some German illumination of a similar date, and an early French carved walnut panel; while the modern work includes a design for an intarsia panel by Stephen Webb, hammered metal work by W. J. Neatby, a carved oak altar front by Joseph Phillips and an appliqué panel by Lindsay P. Butterfield. The letterpress in the issue includes some remarks on the influence of Morris on British decorative arts of to-day, by J. Scarratt Rigby, and "The Modern Illuminator," by Edward F. Strange. "The Art Workers' Quarterly" is edited by Mr. W. G. Paulson Townsend and is published by Messrs. Chapman & Hall, Ltd., 11, Henrietta Street, Covent Garden. The editorial offices are at 16, Clifford's Inn, Fleet Street. The price of each number is 2s. 6d.

The Pavement of Siena Cathedral.

This book, which is one of the series of "Handbooks of Great Craftsmen" now being published by Messrs. George Bell & Sons, deals in detail with the beautiful pavement of Siena Cathedral, itself one of the most interesting Gothic buildings in Italy. The ornamentation of this pavement, which is that of pictorial representations in marble, not tesserae, was the work of 200 years, during which time many variations from the original design—if such there ever was—were made by the numerous artists who applied themselves to it. Roughly, the scheme consists of five large squares having centre panels extending down the middle of the nave, with five other panels on either side enclosing designs of the various sibyls, of which the Samian sibyl is perhaps the most beautiful. At the junction of transepts and nave is a great hexagonal treatment of pavement, while around are set panels representing the Massacre of the Innocents, the Expulsion of Herod, and other subjects, the apse being decorated in a similar manner. Vasari states that Duccio made a design for the whole scheme, but there is no documentary evidence to support this: in fact Duccio died more than fifteen years before the larger Duomo scheme was finally abandoned, while the earliest date of decorative work is 1369, two years after which the pavement of the nave from the cupola downwards was begun, and among other things was laid out the design of the Wheel of Fortune. The following year the circle containing the emblems of Siena was commenced, this being the only portion of the floor which is tessellated. The decoration scheme went out year after year until the middle of the sixteenth century was reached, by which time the work was finished. Since then many restorations have been made, the whole of the floor having been completely restored between 1864 and 1878, but this later work is more satisfactory than the unsympathetic treatment of the earlier desecrators: some of the old work which had become too much injured to remain *in situ* was removed to the Museum of the Opera del Duomo and replaced by copies. Through the courtesy of the publishers we are able to give in the centre plates a general view of this wonderful pavement.

"The Pavement Masters of Siena," by Robert H. Hobart Cust, M.A. London: George Bell & Sons, price 6s. nett.

The Imprimerie Nationale, Paris, about to be demolished, contains two rooms of great artistic value—the "Salle des Poisons" and the "Cabinet des Singes." The cornice of the first is beautifully decorated, and the door is a fine bit of work. The "Cabinet des Singes" contain nine panels, painted by Huet. M. Berger, president of the Central Union of the Decorative Arts, has asked that these may be placed in the new Musée des Arts Décoratifs, in the Pavillon de Marsan.

R. I. B. A.

BALDASSARE PERUZZI.

By F. W. BEDFORD.

A MEETING of the Royal Institute of British Architects was held last Monday evening, Mr. William Emerson presiding. The deaths of Mr. James Stevens, Fellow, Mr. E. W. Barnes, Fellow, and the Marquis of Dufferin and Ava, Hon. Fellow, were announced. Mr. O. Smith then announced that a fund, contributed to by several members of the Institute and others, had been formed to purchase from Mr. J. K. Colling the drawings which he had prepared to illustrate his well-known book "Details of Gothic Architecture," and he formally presented the drawings to the Institute. Mr. F. W. Bedford then read his paper on "Baldassare Peruzzi," of which the following is a summary:—

Peruzzi was born in Siena in March, 1481, the son of a weaver of Volterra who had settled in Siena. As a youth he delighted in frequenting the workshops of the goldsmiths and others who practised the art of design. At the age of twenty he was appointed assistant to Pinturichio, who was engaged in painting the chapel of San Giovanni. He shortly after went to Volterra and painted a chapel near the Florentine gate, and then was persuaded to go to Rome. Here, entering the workshop of the father of Maturino, he greatly impressed his master and other artists by his power of design and painting. Agostino Chigi, a rich Siennese banker, befriended and supported him while he devoted himself to the study of the architectural antiquities of ancient Rome. During his stay in Rome, from about 1503 to 1522, he painted and designed a great many buildings. He then spent some time in Bologna, whither he had gone by invitation of the wardens of St. Petronio that he might take part in the competition for the completion of that church. From Bologna he was almost compelled to return to Siena to prepare designs for the fortifications of the city. After completing this work he returned to Rome and became engaged on St. Peter's. In the sack of Rome, in 1527, he was made prisoner, was maltreated and shamefully tormented, and lost all he possessed. He was ransomed by the Republic of Siena, and was appointed to superintend the fortifications of that city. In 1529 he was sent by the Pope to help the Papal and Siennese armies in subduing the city. After the war he returned to Rome and became engaged in the erection of various palaces and on St. Peter's. He found time, too, to study astrology and mathematics, and became so expert in the art of perspective drawing as to surpass all other masters of the day. He commenced also a book on the antiquities of Rome, with a commentary on Vitruvius, and prepared many drawings for the illustrations. Many writers speak in eloquent terms of Peruzzi's nobility and modesty of mind, which, however, were imposed upon by his patrons, so that in his old age he was very poor. He died in January, 1537, and was buried in the Pantheon by the side of Raphael.

The author then treated of Peruzzi's architectural works—some still to be seen in Italy, others spoken of by various authors but no longer existing, and others which have been attributed to him. Among the former mentioned were the Palazzo Massimi, admired by Peruzzi's contemporaries and since held to be among the masterpieces of the Renaissance. The beauty of the plan and the refinement of the details have never been surpassed. The cortile of the Palazzo Massimi alle Colonne is one of the most charming in Rome. A still more famous work is the Villa Farnesina, a work which Baron von Geymüller attributes to Raphael. The author dealt with this subject at some length, and showed the weakness of the reasons adduced by Baron von Geymüller in favour of Raphael as the architect. Having referred to a number of other buildings undoubtedly Peruzzi's, or generally attributed to him, the author next discussed Peruzzi's share in the various designs and plans made for St. Peter's. Peruzzi was appointed architect to St. Peter's on August 1st, 1520—less than five months after the death of Raphael—and held

the post until May 6th, 1527, and from 1530 to 1531, and again from May, 1535, to January 6th, 1537, the day of his death.

In Siena, Peruzzi's chief work was the rebuilding and strengthening of many parts of the city walls; he built seven towers or gateways, four of which—the Porta Laterana, the Porta Pispini, the Porta St. Prospero and the Porta Camollia—still remain. His most interesting work in Siena is the Palazzo Pollini, or Celsi—one of the most refined and dignified little palaces in Italy. The Palazzo Turchi, outside the Porta Camollia, was built about the same time as the fortifications and the Palazzo Pollini, for in the cornice, which is of terracotta, Peruzzi has not only used the same enrichments, but has employed the same moulds for the casting. The details of the frieze, architrave and cornice are almost Greek in their refinement. A number of other buildings by Peruzzi, or attributed to him, were referred to. Many of his designs for the church of St. Domenico in Siena are preserved in the Uffizi. Leaving Siena, the author went on to buildings designed by Peruzzi at Carpi, Ferrara, Vallepiana, Viterbo, Bibbiano and Caprarola. Vasari says that "Peruzzi prepared the design and model for the cathedral of Carpi. . . . The structure was built under Peruzzi's direction, and according to the rules laid down by Vitruvius."

The author concluded with some remarks on Peruzzi as a painter. His paintings were classed with the best of his day. Most of them were executed as fixed decorations, and very few of his easel pictures exist. The influence of Pinturichio, doubtless his first master, is seen in all Peruzzi's paintings. Later he owed much to Sodoma and to Raphael. Some of his most celebrated paintings are those in S. Maria della Pau. They were done in 1515 or 1516, and are strongly influenced by Sodoma and Raphael. The paintings in the Villa Belcaro, which belong to Peruzzi's later years, are among his best and show great decorative power. They are dated 1535.

Peruzzi is said to have been the most elegant painter among the architects, and the most ingenious architect among the painters. He was unfortunate in that he happened to live at the same time as the three greatest geniuses of the Renaissance—Bramante, Raphael and Michelangelo—whose influence permeated the whole of the artistic world, and made it impossible for any other artist to achieve anything free from the charge that he owed the idea to one or the other. But although he learnt much from them, he still preserved more of his originality than his other contemporaries, and infused a spirit of refinement into his work which has never been surpassed. No architect, excepting, perhaps, Brunelleschi and Bramante, did more in the development of the application of Roman architecture to modern times.

In the discussion which followed Sir Henry Howarth, Professor Beresford Pite and Colonel Prendergast spoke.

The Widening of the Strand in connection with the new street is expected to be finished in May next, soon after which it is hoped that the crescent road will be formed.

The Bristol Association of Clerks of Works and Builders' Foremen held its annual dinner last Saturday evening, Mr. Peter Addie presiding. Mr. A. S. Scull gave the toast of "Architects, Engineers and Surveyors." Mr. Frank Wills (President of the Bristol Society of Architects) responded. Nothing could be more pleasing to the architects than to know that this association, formed in the interests of its members, the clerks of works and builders' foremen, was getting on so well. With regard to what was called limiting the output, he thought that it would be quite possible that the men should work shorter hours and do as much work as they did now; the early morning hours were often wasted. Mr. W. Kidwell proposed "The Bristol Master-Builders," and Mr. G. Wilkins (President of the Bristol Association of Master-Builders) replied. The Chairman submitted "The Bristol Association of Clerks of Works and Builders' Foremen." Mr. W. F. Read (President) replied, and said they were combined to safeguard their own interests. He suggested more confidence between the builder and his foremen.

Trade and Craft.

A Great Sanitary Catalogue.

The twentieth-century catalogue of sanitary specialities which has just been issued by Messrs. Twyford, Ltd., is one of the largest and most elaborate that we have yet seen. Some idea of its size may be gauged from the fact that its price is £1, which amount is refunded on the first ensuing transaction of £5. The catalogue is divided into two parts, one including water-closets and their accessories, lavatories, urinals and baths, and the other dealing with fireclay goods. A very admirable feature is the printing of sectional diagrams showing clearly and in detail the various water-closets and other apparatus printed in colours on the opposite pages. The advantages claimed for the "Twycliff" patent syphon w.c. are that sewer gas cannot issue from it, that the water-surface is extra large and the seal deep, that the action is practically noiseless, and that the construction is simple and trustworthy. The special features of the "Axis-Syphon" are a patent after-flush chamber, a deep seal, a detachable syphon bend which can be placed at any angle, reliability of action with 2 gals. or 3 gals. flush, and the joint between the basin and the syphon bend always under water. Another pattern, the "Oriental" combined pedestal w.c. basin, was originally designed for use in Oriental countries in conformity with the customs of the natives, but at the suggestion of an eminent medical authority the design has been modified and in the present form will be found of inestimable advantage to sufferers from hæmorrhoids. Other patterns include the "Nereus," the "Cardinal," the "Sirdar," the "Deluge," the "Axis," the "Orion," the "Planetas," &c. All these numerous varieties are each intended to suit certain particular requirements, and they are to be obtained either plain or ornamented. The section devoted to lavatories shows an immense number of varieties, from simple basins with ordinary taps to elaborately-finished articles provided with patent wastes and overflows; there are also shown many forms of folding and cabinet lavatories, as well as lavatory ranges (the quadruple marble lavatory range with four basins arranged together is very neat and pleasing); while more than sixty varieties of fountain hand basins are illustrated. Urinals and baths are dealt with in a similarly exhaustive manner, and a great many kinds of baths are shown in the fireclay section, safety fittings being provided for hospitals and asylums. Another novelty is the combined shower and foot bath and lavatory, which is intended for the use of miners, ironworkers and others similarly engaged. Altogether this catalogue is a most

comprehensive one, and it should be in the hands of all architects and builders. Messrs. Twyford's London showrooms are at 120, Southampton Row, their potteries being at Hanley.

Stable Fittings, Iron Staircases, &c.

The St. Pancras Ironwork Co., Ltd., of St. Pancras Road, London, N.W., have bound up in book form their four catalogues dealing respectively with stable fittings, cow-house and piggery fittings, iron staircases, roofs, &c., and basement lighting: to the design and manufacture of which so much care and attention have been given. As regards the stable fittings, a very great number of which are illustrated, these are fitted together and marked before leaving the works and they are also given one coat of metallic paint to protect them from rust during transit and fixing. The posts of the stall and loose-box divisions are formed with plinths at the paving line, thus improving their appearance and increasing their strength at a most important point, and the improvements in the mode of constructing these divisions (secured in the patents of 1876 and 1884) has reduced the cost of fixing by one-half, unskilled labour only being required. In fixing the divisions it is necessary to erect all the ironwork first, then to lay the paving, and afterwards put in the boarding. For years past the St. Pancras Ironworks Co. has paid special attention to the paving and drainage of stables and the paving brick secured by their tenth patent is a very excellent one. This brick is perfectly non-absorbent and when properly laid and grouted forms a thoroughly water-tight surface; moreover, it is extremely hard, though it does not polish in wear or become slippery, on account of its gritty nature. The colour is brown. This catalogue shows some interesting plans of stables and also includes some practical notes and suggestions. The catalogue of iron staircases similarly gives some practical notes, while the very large number of varieties illustrated should satisfy every requirement; the outside fire-escape staircase, of which so many have been fixed by this firm to some of the largest buildings both in London and the provinces, are especially satisfactory: a fact which has found such a large demand for the manufactures of the St. Pancras Ironworks Co., Ltd.

Some New Drawing Instruments.

Several new drawing instruments have been patented by Mr. James P. Maginnis, A.M.I.C.E., M.I.M.E., engineering draughtsman, of 9, Carteret Street, Westminster, S.W. One is a T-square attachment, consisting of two slotted plates, which enables the square to be set at an oblique angle to the drawing-board, thus facilitating the drawing of plans, for example, which

run crosswise. Another device is the "Dead Beat" sectioner for indicating on drawings and tracings the various materials used in construction, and the specimen before us of work done with this instrument is certainly good. Another of Mr. Maginnis's inventions is an adjustable saucer-stand which can be tilted to any desired extent; another a drawing-paper clip; another a pencil-beam compass; and, lastly, a universal sector: particulars and prices of all of which can be obtained on application.

Smoky Chimneys.

Of the two kinds of smoky chimneys—those that smoke outside and annoy the neighbours, and those that smoke inside and annoy the occupants—perhaps the latter are the more exasperating; but the disadvantages of many smoky chimneys outside is deplorably evident in cities, where the air is made heavy and the sky obscured by murky clouds of unconsumed coal dust. Very often the smoke nuisance can be cured by placing a good cowl on the top of the chimney, which will create a strong updraught and prevent downdraught. Several such cowls are made by Messrs. Ewart & Son, Ltd., of 346, 348 and 350, Euston Road, London, the most successful being the "Empress." The head of this cowl has a carefully-turned spindle which works in a steel centre, always thoroughly lubricated, and it is thus possible to obtain a high speed without noise and with the least possible friction. The fans are made of steel well tinned to prevent them rusting and enamelled over afterwards. The other parts are made of strong galvanized iron riveted together and enamelled black. The fans are so arranged that they keep themselves clean of soot as they revolve and there is no obstruction to the sweep's broom, which can be pushed up to the top but cannot injure the oil cup or spindle, nor strike the revolving parts. The price of this "Empress" cowl varies from 25s. for small gas stoves to £3 5s. for large kitchen chimneys. Messrs. Ewart also make the "Prince" chimney pot for preventing downdraught, the "King" to quicken and regulate updraught, the "Vacuum" chimney pot, the "Exhaust" chimney pot, various wind guards, a large variety of revolving cowls on short bases for brickwork or to slip into existing chimney pots, and also the "Victoria" outlet ventilator, which last has been tested with highly satisfactory results.

New Classrooms, Bradfield College.—In this design by Mr. Mervyn Macartney an attempt was made to give an appearance of age to the brickwork in order to bring it into consonance with the older buildings; but the excessive neatness of the British workman doomed the attempt to failure.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

An Architectural Causerie.

THE memorial to the late Lord Leighton which was unveiled in St. Paul's Cathedral

last week is one of the finest of Mr. Brock's many fine works: its pedestal of Cippolino marble, with a black marble base, is treated in a satisfactory architectural manner and in admirable proportion to the bronze sarcophagus which bears the recumbent figure of our greatest classical painter: of which Sir Edward Poynter said in the course of the unveiling ceremony, "it presents to the world a record of the man in a portrait which I may venture to say has never been surpassed for vivid resemblance, for beauty of expression, and for tenderness of feeling." At either end beneath the sarcophagus are the figures of Painting and Sculpture. It is not without interest that this monument should be close to that splendid work by Alfred Stevens which was rescued from its obscurity in one of the chapels of the cathedral and placed in its present position through the energy and generosity of the dead artist now so fittingly commemorated.

Architects' Commissions.

A SHORT time ago the Bishop of Coventry said at a meeting of the Birmingham School Board, of which he is the chairman, that "when architects were paid partly or wholly by commission it could hardly be possible, human nature being what it was, that they should make economy their principal study, or even their serious study at all"; and later he said in a letter to Mr. William Henman, the well-known architect of Birmingham, who took up the cudgels on behalf of his profession, that "given on one side the ratepayers' purse, the desire to produce artistic results, and a percentage on the cost, and on the other side a conscientious and pious wish for economy, the strain upon 'human nature, being what it is,' is excessive." The point is an interesting one, and examples might be brought forward in support of both views of the case: but it is not just to saddle the general body of architects with the statement that they do not attempt to reduce the cost of buildings when their commission is proportionately augmented by it. In designing a Board school, for example, a respectable architect does not add features simply because they will increase the cost and his commission on it. If the Board is prepared to spend, say, £10,000 on the work, he endeavours to design a building which will cost that sum; he cannot—and is not to be expected to—do this exactly; and if the tenders exceed the amount, that is not necessarily the architect's fault. The cost may be

reduced if deal is supplemented for oak, if tile dados are dispensed with, or if door fittings of a less substantial character are used—a process of reduction often practised; but the school will be proportionately impoverished by these alterations: and if the architect considers that the better fittings should be used, because they will eventually prove the more economical, he is not to be blamed for including them in his original design. There have certainly been many cases where excessive expenditure has been wantonly passed by architects, who have made no attempt to lessen it, but an aspersion must not be cast on the whole architectural profession because some of its members are defaulters with an easy conscience.

A Sedding Church.

THE church of St. Clement, Bournemouth, built in 1873, is the best known and most interesting of the early works of John Sedding.

too, strayed from the fold Botticelli, stand as pinnacles on the corners of the aisle. The reredos at the back of the high altar is crowded with saints, while the panel below them is filled by a figure on horseback, representing Lieutenant Edwin Christie, to whose memory it was erected. The Life of St. Clement is figured on the font. His anchor is patterned on the floor throughout the church; large in the nave, and small in the chancel, and on the scutcheons suspended from the lamps. On the pulpit rails we also have his anchor and monogram cast in copper; and the balustrade is twisted into flowing wreaths of seaweed. Mr. Wilson, who completed the church, was associated with John Sedding in much of his later work. He is one of the chief leaders in the Arts and Crafts movement: an accomplished worker in metals: and considered by many to be one of the finest architects and craftsmen of to-day. Mr. Wilson has said: "The best work of John Sedding will, I think,

ST. CLEMENT'S CHURCH, BOSCOMBE, BOURNEMOUTH. DESIGNED BY THE LATE J. D. SEDDING AND COMPLETED BY H. WILSON.

It stands back from the road, an oasis in a desert of villas, and has a nave, north aisle, north porch, chancel, lady chapel, vestries and a western tower, the last completed since his death. The nave arcade has pointed arches, with capitals hinted at rather than expressed. Above the arches is a range of stone panels, homes prepared for an army of saints. The chancel and lady chapel are divided from the nave by stone screens. The design of that in front of the chancel is a daring and original combination of intersecting arches, surmounted by a row of angels holding candlesticks, while the cusps of the side openings bud out into tiny adoring angels folded up in bract-like wings. Angels,

never be fully known. It can only be appreciated in its effects. It was not what he did that should command our greatest admiration, but what he made others do. His claim on our regard does not rest, as some may think, on the invention of a new style, nor even upon the more or less successful modification of an old one, nor does it rest wholly or even mainly on the mass of work he left behind, beautiful as much of it is. It rests on his personal influence, on his inspiring enthusiasm, on the intellectual stimulus he provided. . . . Sedding's art is not scholarly, but his designs are full of himself, and those who knew his nature are the greatest admirers of his work."

A CASTLE ON THE RHINE: FROM A DRAWING BY VICTOR HUGO.

VICTOR HUGO AND GOTHIC ARCHITECTURE.

By F. H. CHEETHAM.

[NOTE.—The Victor Hugo Festival at Paris began yesterday and the monument on the Place Victor Hugo is to be unveiled to-day. The festival will be continued till March 2nd.]

VICTOR HUGO, the centenary of whose birth is just now being celebrated, although by no means the first to give the name of a building to a work of fiction, is perhaps the only writer who has succeeded in investing an architectural creation with all the glamour of a hero of romance, and making it in a very real sense the central point of a story. The human interest in "Notre Dame de Paris" is, indeed, immense, but the dark mass of the Gothic cathedral seems to overshadow everything in the romance and to colour and influence the lives and characters of the actors in it. Huysmans has given a wonderful picture of Chartres in "La Cathédrale," but that book cannot, strictly speaking, be ranked as fiction, lying in a category of literature so far removed from "Notre Dame de Paris" as to preclude any comparison with it. M. Huysmans is as superior to Hugo in scholarship and real knowledge of art and architecture as Hugo is to the living writer in the exuberance of his imagination and the grotesqueness of his fancy. Scholarship and learning are the last things to be looked for in Victor Hugo. It might, perhaps, be going too far to say that he was a very ignorant man, but his assumption of a knowledge which he did not possess throws his ignorance very often into strong relief. But he had an intuitive faculty of perception at times, which, joined with an overweening self-confidence, gave a tone of authority to his words from the influence of which it is difficult to escape. Turgeneff tells a story of Victor Hugo which is very characteristic. The Russian novelist once asked Hugo who was Galgacus, whom he had included in a list of orators in some poem. "I have not an idea," was the poet's reply, "but it is a fine name."

It is probable that Victor Hugo had no real knowledge of architecture, although he indulges in a long dissertation on the subject in a well-known chapter in "Notre Dame de Paris." This novel was published in 1831, when the stream of the romantic revival was at its full. The battle had been won on the stage the year before with "Hernani." Now the triumph was repeated in another sphere. Mediæval Paris was made to live again in the pages of "Notre Dame," and for the first time, perhaps, for many generations the city recognised the living beauty and merit of her cathedral church. There was a mediæval enthusiasm in the air, which might have given an outside observer the impression that France, as well as our own country, was on the threshold of a Gothic revival. We know now

that there was no Gothic revival in France, and that there is never likely to be one. But the statement should not be made without a qualification. It is true that France saw no revival of building in the Gothic style, but she did see a very remarkable revival in appreciation of the art of the Middle Ages, the art which the eighteenth century had branded as barbarous. And this appreciation has never been lost. France looked back without going back, and her appreciation of the past is now no less real because she lives her own life in her own way. Victor Hugo quotes Voltaire as saying that before the time of Louis XIV. Paris possessed only four fine pieces of architecture, the Dome of the Sorbonne, the Val de Grace, the Louvre and the Luxembourg. "This opinion," says Hugo, "only affords one evidence, among so many others, that a man may be a fine genius and yet understand nothing of an art which he has not studied." Yet Hugo himself falls into an error almost as great as that of Voltaire. So wrapped up is he in the Paris of the fifteenth century that he has only words of condemnation and sarcasm for all the developments that have taken place between that time and his own.

He was a true Goth. Not that he understood Gothic architecture in the way a student understands it. But in his own way he did understand it. It spoke a living language to him, he felt its influence, and he tried to convey its message to others. His imagination was as grotesque and fanciful as the work of the mediæval builders that he so much admired. It was the Gothic spirit, so to speak, that he breathed, more than any knowledge of the art of a past day, that made him able to put life into the stones of the old cathedral of Paris. In this Victor Hugo differs materially from Sir Walter Scott. Scott's novels are generally held to have been one of the factors that helped towards the Gothic revival in England. There can be little doubt but that they were so. They created in the minds of a vast reading public an interest in and sympathy for mediæval times and mediæval architecture. Yet it may fairly be questioned whether the Waverley novels have really a trace of what architects call "Gothic feeling" in them. Their atmosphere is rather antiquarian and archaeological than a breathing of the living past. Nowhere are you taken back and made to live what, after all, was not, we may suppose, the very lovely existence of the Middle Ages. Scott's Gothic on paper is perhaps too much like that of his later namesake in stone. Victor Hugo's is as grimy and fantastic as one of Mr. Pennell's drawings of the Devils on his own loved cathedral. And probably that is the truer picture.

A good many causes went to make a Gothic revival in France impossible, which it is not for us here to enquire into. More than a century of academical training had put French architecture well on to the road which it has travelled on ever since. The Renaissance spirit was too

deep down in the French nature to be affected by even the passions of the romantic revival. But in truth the romantic revival had really no quarrel with Renaissance art, but only with the hard Classic spirit that bound and confined everything by its rigid rules. The romantic movement was, in its broadest aspect, but a struggle for liberty in artistic expression, and in different countries the movement necessarily advanced along different lines. The liberation to be effected in France was entirely different from our English liberation. Here, as far as literature is concerned, the work was done quietly in the study, and passed unnoticed in the street. Our drama was free. But in France the theatre was bound by the unities, and so the stage bore the brunt of the battle. The French had the battle of the Classicists and Romantics in poetry and the drama, with the culminating triumph of "Hernani." We had a battle of Classicists and Gothicists culminating in the triumph of Barry and Pugin at Westminster. Does that, then, imply that our architecture was less free at the beginning of the nineteenth century than that of France? We might hesitate to say so at first, yet there is a sense in which it was. We had suffered, or enjoyed, a Classic revival in architecture such as the French had scarcely fallen under, saved as they had been by their innate Renaissance lightness of spirit.

Sir Walter Scott had an audience ready, so to speak, to receive the influence of his Gothicism. And as his Gothic was clean and lovely withal, it was a pleasant and good thing to receive. Victor Hugo spoke to an audience whose minds in no way responded to his Gothic enthusiasm, and what he had to offer was neither clean nor lovely, but grimy, dirty and full of horrors. True, "Notre Dame de Paris" took hold of people and held them spell-bound. But that was the spell of Hugo's genius, from which even those who dissent most wholly from what he says, and object to his manner of saying it, are powerless to escape. "I liked cathedrals very much on the faith of 'Notre Dame de Paris,'" said Théophile Gautier at a later date, "but the sight of the Parthenon cured me of the Gothic malady never very strong in me." And so it was, we may suppose, with the mass of Frenchmen. Victor Hugo, in his Gothic devotion, as in everything else, stood alone. Though at the outset of his career surrounded with disciples and followers, he finished his life having founded no school, complete in himself, leaving no followers.

Hugo's picture of Paris in the fifteenth century as seen from the towers of Notre Dame is justly famous. He loved the city of his imagination for its picturesqueness, but no less for its homogeneity. "The Gothic Paris," he says, "was complete but for a moment." It is that moment that he seizes upon and never ceases to regret. "Since then this great city has been daily sinking into deformity . . . the present Paris has no general physiognomy. It is a collection of specimens of several different ages, and the finest of all have disappeared. This capital is increasing in dwelling-houses only—and in what dwelling-houses! If it goes on as it is now doing, Paris will be renewed every fifty years. So, also, the historical meaning of its architecture is daily wearing away. Its great structures are becoming fewer and fewer, seeming to be swallowed up one after another by the flood of houses. Our fathers had a Paris of stone, our sons will have one of plaster."

These last words have been often quoted. They were written in 1830, and never have words of ill omen been more happily falsified. Hugo was singularly unfortunate in his prophecies and predictions whether in art or in politics. Yet at the time he was justified in his fear of a Paris of plaster. "The city of plaster," writes Philip Gilbert Hamerton, "might have filled the whole space within the fortifications to-day if the railways had not brought stone so easily from a distance, but by a happy coincidence the colossal building enterprises of Napoleon III. were not undertaken before the principal lines of railway had been constructed, and by their means, not stone only, but vast quantities of wood and other materials were brought readily to hand." Under the Second Empire a new, and to some extent a homogeneous, Paris arose, and there is a certain irony in the fact that the man most responsible for saving the city from the future of plaster and meanness that Hugo

MR. ALFRED GILBERT'S ADDRESSES ON SCULPTURE.

IN the first of the six addresses on sculpture (entitled "Endeavour") which he is to deliver at the Royal Academy Mr. Alfred Gilbert, R.A., spoke at some length on the career of the late Onslow Ford. In years to come his name would be more to them than that of a teacher—it would be a name of honour. Onslow Ford began his studentship at a time when sculptors were in despair. There was no school of sculpture in England except one founded on pseudo-classic traditions, the school of which Gibson was the great seer. Ford came in on the receding tide of this period, and he had every difficulty to face. Where to study? what to do? Everything was chaos. So he went to Antwerp where other great artists had been trained, but found nothing more than there was in England. And in this connection, remarked Mr. Gilbert, his hearers might take it from him that the Royal Academy Schools now were quite as much—or more—up-to-date than any Continental schools; so that it was a fallacy for the students to go abroad to study amid surroundings with which they were out of harmony.

But to return to Onslow Ford. He learnt the rudiments of his art at Antwerp, but Antwerp was a "one horseshay" school, where all the

teaching was built up on a blind tradition, following which the professors said, "We had to learn all this years ago, and so you must learn it too." Anyone who broke away from this tradition was a black sheep, and they could easily imagine how a nature like that of Onslow Ford rebelled. Then he tried Munich, a school that was then waking up, and here, apart from technical training, he came insensibly under the influence of a certain phase of poetic feeling peculiar to Germany and to the German race, a phase of feeling—if he might say it without offence—that was impossible to a people of mixed descent like the Belgians. Here, too, he felt the influence of Wagnmüller, a sculptor whose realistic portrait busts the students might not know, though they were surprising examples of the work of a surprising artist.

Referring to this sculptor's influence on Onslow Ford's work, Mr. Gilbert spoke of a visit he himself made to an exhibition in his student days, when he was seeking training where he could not find it. He came across some portrait busts by Onslow Ford which stood out pre-eminent from the rest of the work, and wondered whence this man, then a stranger to him, had obtained certain qualities. Two years later he made his acquaintance and found out.

Returning to his introductory remarks Mr. Gilbert said that in his student days he remembered a Greek motto on which later on he should base a discrimination between chance and willed

foresaw for her, was the very man to whom Hugo owed his exile, and upon whose head he poured forth all the most venomous rancour of his hatred.

The mediæval spirit in Victor Hugo is perhaps nowhere more happily illustrated than in the imaginative picturings of the volumes called "Le Rhin." There, in the realm of legend and fairy tale, Hugo's imagination may have full play without our wishing to offer a remonstrance. His fancy goes out not only in words but in a vigorous and astonishing manner with his pencil. He was no mean draughtsman, but many of his creations are such as might well be calculated to keep a naughty child quiet. What Amiel said of his word pictures might very well be spoken of some of these sketches: "Victor Hugo draws in sulphuric acid, he lights his pictures with electric lights. He blinds, deafens, and bewilders. Strength carried to such a point as this is fascination." These sketches show an innate grotesqueness of imagination, something which could in no wise be the result of a mere accidental knowledge of a past art. But what knowledge and appreciation of Gothic architecture Victor Hugo possessed may perhaps be said to have had something accidental in it. The artist, he argued, should not strive to be greater than the Creator himself, whose world is not uniformly beautiful. Everywhere hideousness goes side by side with beauty, evil is mingled with good, and he conceived it to be a law of the highest art that the beautiful itself would be made more beautiful by the near presence of what is ugly. The art of the Middle Ages offered him this contrast, and Notre Dame with its juxtaposition of the sublime and the grotesque was a summing up in stone of his whole theory and conception of the romantic revival. Did the cathedral first unconsciously put the idea into Victor Hugo's head, or did he merely find in it the expression of his own fancy? That it had no such influence on other great minds of the time travelling along the same road may in itself not answer the question, but, looking back, as we are now able to do, over the completed life and work of Victor Hugo, we may safely say that the grotesque was as much part and parcel of Hugo's real self as was his magnificent genius or his amazing self-assurance.

The Foundations of a Roman Villa in Greenwich Park were found last week. The space opened has an area of about 16ft. The loose materials found so far include some tiles, pieces of mortar, and fragments of wall plaster of four different colours.

Mr. Edwin O. Sachs has, with a view of obtaining some relief on the executive side of his practice, made arrangements by which he will enjoy the co-operation of Mr. G. Spencer Hoffman, M.A., eldest son of Dr. H. W. Hoffman, late of the Home Office, and of Coombe Lodge, Putney. Mr. Hoffman, who was a pupil of the late Sir Arthur Blomfield, A.R.A., will practise with Mr. Sachs as his junior partner, and their mutual work will be carried on in the names of Edwin O. Sachs & Hoffman.

composition. Freely translated it ran thus: "Always strive after the best," but the motto in its Greek form would be the text of his lectures. The lecturer wrote it on the black-board in Greek characters, and said that he wanted to show them in future addresses that the Greeks were artists no less in their writing than in their sculpture.

Mr. Gilbert said in conclusion he wished to impress on the sculptor students a sense of the difficulty of the task before them. The honours were few, the failures many. It was a narrow ladder they had to climb, and it might happen that when they had reached the topmost round they might fall to the bottom and have to begin the climb all over again, full of disappointment and heartburn and gloom.

"To Accomplish" was the theme of Mr. Gilbert's second address on Thursday last. It was, he said, the outcome of industry, perseverance and self-control. Study was the ABC of their art, by which they learnt to attempt to accomplish, but he took it they would not be there at all unless an intellectual birthright gave them a calling towards the sculptor's art. To aid his precepts, he made a diagram of a tree, whose roots were romance and poetry; the greatest girth of its stem represented intellectual accomplishment, which merged into idealism. Above this was a label that stood for schools, on either side of which were boughs weighted with realism and mannerism; branching above this were individuality and self-control united by a seed-vessel called style, and this bore the opening bud of achievement, which, when more fully expanded, became creation. Realism and mannerism would give mere mountebank results, and true sculpture was essentially an expression of individuality. Mannerism, or fashion, was a great stumbling block, for it was natural to be struck with what at exhibitions won public applause and to copy it without remembering that they had neither the art nor the heart of the original artist.

Mr. Gilbert had noted the expert manipulation, the nimbleness of finger, in the schools, but as he was speaking as a guide rather than as a teacher he felt bound to say he did not see similar attention given to subject and design. Blake, he said, was in essence more of a sculptor than any man had ever been, except Flaxman, for the great mind was always giving forth something. Choice of subject was very wide, and should be a primary object or the work would be like a poor actor speaking indifferent lines of an inconsiderable author. Technique was more imperative than to a painter, as he could always change his colours, but a sculptor's colours were confined to light and shade, his only other aids being line and form. Mere imitation of ornament by undercutting, such as laces, flowers, &c., of modern Italian work, had none of the solid majestic quality true sculpture demanded. Goldsmithery was different; its licence was unlimited; its mission was to please; it was a toy.

The first thing to consider in designing sculpture was whether it was for indoors or outdoors, monumental or ideal, as this would determine its treatment. There were two kinds of design, accidental and willed, and he would insist that they should give most of their love to the willed, for he saw work in the schools that smacked of flukes such as he evolved on the blackboard after flinging a sponge of colour against it and using the accidental mark as the basis of a design. Speaking of creative work he referred to the remarkable powers of Claude. Nothing was chanced, nothing fluked, everything was willed out of his observation, and he never pandered to fashion and commerce—he was not a mannerist. Flaxman certainly was a mannerist, but not commercial; he had not the advantage of studying the Elgin marbles, and the Roman-Graeco things by which he was trained, though admirable in their way, were not the highest expression of sculpture.

Study of the antique was good training, because it was approached as being the beautiful ideal of great artists, and, unconsciously, intuitively, the student absorbed effect-of-will-design, beauty of line and proportion. The really true was nearly always ugly, and as the students grew older they would find truth was most disagreeable. If truth were ugly, they must lie for all they were worth, and thus give truth the lie. Their duty was to eliminate all that was ugly in

BOARD SCHOOLS, CRESSING. CLARE AND ROSS, ARCHITECTS.

Nature; they must leave nothing behind them of which it could be said the artist was a great sculptor with ugly ideas.

SUBURBAN HOUSES.

The Discussion in Parliament on the new Bill.

THE Urban Site Value Rating Bill came up for its second reading in the House of Commons last Wednesday, but was rejected by a majority of seventy-one. In presenting the Bill, Mr. Trevelyan said that the effect of it would be a fundamental alteration in their system of local taxation and the addition of a source of revenue which had hitherto been largely neglected. With the rates at 6s. and 8s. in the £, he asked the House to consider what happened in regard to building on the outskirts of towns. If they took the assessment of a house at £50, only about £5 of that was probably land value and the whole of the rest of the burden of the 6s. and 8s. taxation was on the value of the buildings; that was to say, it was a direct tax of a very serious and severe kind on building, industry and improvement. The main proposal of the Bill was that the existing rating system should not be touched, but that side by side with it there should be a new valuation of the site value whether it was built upon or not; that it should be left to the municipalities to levy a rate up to 2s. in the £ upon the new assessment, and that this should go in relief of the ordinary rates in so far as they were applicable to ordinary town improvements. Mr. Harper, the valuer of the London County Council, had made a rough and approximate calculation as to what the effect of this tax would be in the case of London. He estimated that the land values of London came to something like £15,000,000, and that a 2s. in the £ rate would in that case meet as much as the County Council raised for its own special purposes. He proposed that the present ratepayer should pay the tax, that present contracts should remain untouched, and that in future contracts half the site-value rate should be payable by the owner. There had been great discussion as to whether it was possible to value sites separately from the buildings, but he would point out that in the case of many of their Colonies which had adopted this system for national as well as for local purposes not the least difficulty had been found in assessing the site value separate from the improvements, either in the town or in the country.

Mr. Griffith-Boscawen, in moving the rejection of the Bill, said that no machinery was provided in it for making the valuation, which was left to the various local authorities and assessment committees, and if it were adopted we should have purely arbitrary and conflicting values put upon sites by these bodies and nothing whatever would be gained. The Bill was, moreover, inequitable, because the tax would be put not only on land which had improved but on land which had depreciated. Hon. members seemed to think that there were

great landlord monopolists who were holding back their land and causing the congestion in our cities. It was thought that if they taxed these people they would make them build. A more unfair proposition he never heard of. A man had a right to build when he thought proper in his own interest, and if he were forced to build by an impost of this kind it would lead to jerry-building, the erection of a low class of house, and the creation of a low rateable value. If a man were allowed to follow his own interest, however, he would probably build houses of a superior class and bring into existence property which had a good rateable value. If the House passed the measure they would throw into the building market at once every open space which was not in the hands of the public and thus deprive the community of the advantage of them.

R.I.B.A. Prizes and Studentships, 1902-3.—*Essay medal and twenty-five guineas*: "A Comparative Review of the various Past and Present Systems of Architectural Training at Home and Abroad." *Soane Medallion and £100*: "Design for a Town Church on a Corner Site." *The Prize*: "Design for a Pavilion in a Public Garden." *Grissell Gold Medal and ten guineas*: "Design for a Stone Dome over a Porte-cochère to a large Public Hall." Other prizes as before. Copies of the pamphlet giving full particulars of these competitions can be obtained at the Institute (9, Conduit Street, W.), price 3d. each.

Schools at Cressing, Baintree.—This little building, designed by Messrs Clare & Ross, of Chelmsford, has recently been completed at a cost of £2,500. The interior is furnished throughout with a brown glazed-brick dado, capping and skirting, and the walls above are faced with carefully-selected Fletton bricks, flush pointed and distempered. Accommodation is provided for 200 children, and the school, which is divided by screens into three sections, can be thrown open to hold a meeting of 300 persons. The playground occupies a quarter of an acre and is surrounded by an unclimbable iron fence. On the east side of the school is a six-roomed house for the head-mistress. Mr. Frank Johnson, of Chelmsford, was the builder, and Mr. A. F. Horner, of Croydon, the clerk of works. Ventilation is by windows and "Offa" patent inlets, with openings in the ceiling and concealed roof ventilators for extraction. The rooms are warmed by Landers' patent grates, which supply warm fresh air to the classrooms and, by means of a supplementary flue on the back, are made to warm and ventilate the cloak-rooms as well. Swivel shutter partitions were supplied by the North of England School Furnishing Co. The walls outside are faced with local red bricks and the roofs covered with Tilberthwaite Westmorland green slates in diminishing courses. The windows are solid frames filled in with lead glazing and metal casements to opening lights. The ceilings are plastered and barrel-shaped throughout. The fencing was supplied by Messrs. Boulton & Paul, of Norwich.

THE CEMENT TRADE IN 1901.

MESSRS. TULLOCH & CO., the well-known brokers and exporters of English, German and Belgian cements, of 4, Fenchurch Avenue, London, E.C., state in their annual report (just issued) that, in common with most manufacturing industries, cement during 1901 suffered from the prevailing depression in the home and export trades. This applies equally to British and Continental works. In the United States (now a large producing market) 1901 marked a record consumption. Handicapped by high cost of manufacture, prices called for by the Thames and Medway "Associated" Works during the first six months rather tended to hold back buyers in the home trade, but towards the latter half of last year—with more disposition to meet competition—off-take improved. Some of the mills outside the "combine" are reported to have been fairly occupied throughout the year. The "associated" works, whose policy and tactics have been freely criticised, have fully justified their existence by their action in curtailing production and generally exercising a steadying effect on prices. Prices for January to June averaged about 27s. to 29s. per ton at the works, while July to December were easier at 25s. to 27s. Demand for export remained dull throughout the year. In round figures Messrs. Tulloch & Co. estimate total production of the United Kingdom at 2,200,000 tons. Total exports were 306,338 tons, showing a reduction of 53,606 tons as compared with 1900. The United States demand fell off 75 per cent., Canada nearly 50 per cent., latter market largely deserting their Mother Country in favour of American cements. Both British India and Australasia bought more heavily.

The "invasion" of German and Belgian cements into the United Kingdom continues and increases. During 1901 221,019 tons, as compared with 104,771 tons during 1900, are recorded for the total imports for the year. Prices for export fluctuated, starting early in 1901 at

6s. 3d. to 6s. 6d. per barrel for good standard brands, eventually dropping to 5s. 6d. to 5s. 9d. In Germany 1901 has been a record bad year. The history of the last twelve months only proves the futility of endeavouring to bolster up prices by "syndicates." Starting with heavy stocks, competition during the summer months became acute, especially from the more recently constructed works, who with large stocks and little spare capital were compelled to sell. General commercial depression, the reduction in consumption on public works, all helped to produce a severe crisis in the trade. The virtual break up of the "Hanover Syndicate" and a recognition by the "Hamburg Syndicate" of the situation may help the return of a more healthy condition, and the wise policy of the leading works in reducing production has already had a good effect. The estimated total output of the German mills for 1901 is put at 3,357,500 tons. Export demand ruled quiet, prices declining from Ms. 5.75 and Ms. 6.50 to Ms. 5 and Ms. 5.50.

In Belgium, production exceeded demand, especially in the case of those works manufacturing artificial cements. Well-known brands, selling twelve months ago at 6s. per barrel, are purchasable to-day at 5s. to 5s. 3d., but for distant delivery there is a steadier feeling. The estimated total output for 1901 of artificial cements—of which North's and Jossen take the lead—is put at 250,000 tons, of which about 75,000 tons were employed for local consumption. The natural cement industry also suffered, but chiefly as regards the lower qualities. Over-supply in the case of first-quality cements was less marked, the leading works finding purchasers in the United Kingdom for over 170,000 tons during 1901. Total exports for the year of artificial and natural cements were 491,672 tons, as compared with 408,283 tons during 1900.

In the United States the enlargement of existing mills, and the erection of many new ones, caused a large increase in production. Competition became keen and prices were cut below

a remunerative level. The determined attempts to capture the trade of adjacent countries, notably Canada, indicates that we shall have to reckon before long with the United States of America as a powerful export competitor.

In conclusion, prospects of any material improvement in selling values seem remote. Low prices will assist in increasing consumption and in time adjusting supply to demand. If only manufacturers would adopt a less optimistic view as to the rate of increase in the world's consumption and recognise the general tendency of foreign markets to become their own suppliers by establishing local works, the return to a healthier condition of trade would, we think, be more speedily accomplished.

Royal Academy Exhibition, 1902.

The receiving day for architectural works is Thursday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors and to forward them (free of expense) to Burlington House. In order that careful reproductions may be made for publication, it is requested that drawings be sent as early as possible. No drawings can be received by us later than noon on the sending-in day.

Correspondence.

"Papyrolith" and Cork Paving.

To the Editor of THE BUILDERS' JOURNAL, OXFORD.

SIR,—Referring to your correspondent's letter on p. 456 of your issue for February 12th, the makers of the first-named paving are The Papyrolith Flooring Co., Ltd., Dashwood House, Old Broad Street, E.C. The Improved Cork Paving Co. seems to have disappeared from the "advertising world."—Yours truly,

GILBERT T. GARDNER.

BUILDING CONSTRUCTION.

(Concluded from p. 454, No. 266.)

THE student should carefully read and understand the rules issued by fire insurance companies for the "wiring" of houses. The modes in which fires may be produced by electric wires are different from those in which they are occasioned by gas, petroleum or candles. It is, for example, safer to read in bed by electricity than by other lights; there is no danger from the glowing filament. Electricity will not "explode," but just as a lighted match or candle will explode a mixture of gas and air, a tiny spark of electricity (as everyone who uses an electric gas-lighter knows) will set fire to an explosive mixture of gas and oxygen. Besides this there are two ways in which electric conductors may directly occasion fires. The student should know the rough-and-ready use of the

formula which is called Ohm's law: it is $C = \frac{E}{R}$ or any form into which this equation may be algebraically put. C is the current in amperes; E , for our purpose, is the difference of potential in volts; and R is the resistance in ohms. Con-

battery.) Compare the battery to the heart of an animal: it is a pump which keeps the animal's blood circulating continuously. The blood circulates because the action of the heart maintains the liquid blood at one side of a diaphragm at a higher pressure than at the other side. If the heart moves weakly there is a reduction of difference of pressure and there is a small current; if it stops there is no difference of pressure and there is no current. The amount of steady current depends on the strength and power of the heart, and so it is with the bell battery, it can only maintain its electro-motive force by its chemical activity, and so when R is diminished by pressing the button the drain upon the energy of the battery is no more than it can supply and E diminishes: the power of the battery is $E C$, and this is in ordinary bell batteries a very small quantity. The student may see a spark when the circuit is broken at a bell push and he will see a continuous stream of faint sparks at the spring contact of a trembling bell. Such sparking might explode a mixture of gas and air, but it will not set fire to wood or material of that kind. Now mark the difference between such a current and the current which is supplied from a central supply station; the heart of the circulation here is the big dynamos and

= 55 amperes. The heating effect is proportionate to the square of the current. $\frac{55 \times 110}{746}$

= watts
= watts in a horse-power = 8.1 horse-power
applied at once to the business of heating this wire and burning the house. Wiring should be done so as to avoid the possibility of such a thing happening, and this is the object of the Fire Office rules. If the conductor is of uniform cross-section and material the whole conductor will be uniformly heated, as is the case with a lamp filament; but if it is smaller in cross-section at any particular part the heating will be greater at this part: if the part is so proportioned that a very small quantity of heat will produce a temperature which will destroy this part and also that it will not introduce so much resistance as will interfere with the voltage at the lamp terminals, the part will be destroyed before the current is sufficiently large or long continued as to dangerously heat the conductor as a whole and in this way interrupt the circuit. As has been already explained such a part is called a *cut-out*.

It is useful for a practical man to have a familiar analogue to help his memory of the phenomena of such things as electric currents. The heart and blood of an animal have been made use of above; it is perhaps better to use the idea of water flowing through a continuous pipe kept circulating by a pump. We have the quantity of water per minute depending on the difference of pressure at the two sides of the pump and the friction in the system, and to this Ohm's law will apply when everything is in steady work; but if the flow is suddenly stopped Ohm's law will not apply because in addition to the steady pressure of the pump you now have the pressure of a mass of moving water being suddenly brought to rest—a pressure which depends upon the rapidity of the stoppage and the elasticity of the pipe and of the obstruction. Besides the great pressure at one side of the obstruction there is a relief of pressure at the other side, because if the water jams up at the first side it must slightly leave the other side, and if we imagine a fine tube connecting these two regions water will pass through it with tremendous velocity. A like phenomenon occurs when an electric circuit is interrupted. Suppose there is a steady flow in the circuit A B C D (Fig. 115) and that at B D two wires are close together with thin insulation, and a small air-space between, a sudden break in the circuit at A may cause a spark to leap across at B and set up an arc which will continue till the wires are consumed to such an extent that the gap is formed wider than the arcing distance for the voltage. Call this No. 1 of the two ways in which fires may be occasioned by electric conductors. No. 2 is when a conductor is over-heated by being called upon to carry too heavy a current for its cross-section, and this may arise either from the conductor being too small in cross-section for its work or from a partial or absolute short circuit in its course. Every current of electricity heats the conductor through which it flows, but the conductor is subjected to cooling influences, currents of air, radiation, conduction: the current must not be greater than that the cooling influences at moderate temperatures will equal the heating value of the current. The rule one hears most frequently quoted is 1,000 amperes per sq. in. of section of copper conductor; but wiring men appear to forget frequently that in addition to safety from fire there is another matter that must not be lost sight of, and that is the loss of voltage at distant lamps. To have the lamps of an installation burn equally bright the resistance between every lamp and the meter should be as nearly as possible the same. This ideal cannot be exactly reached, because the conditions vary with the number of lamps which may happen to be used at any particular time.

(a) Let A B (Fig. 116) represent a pair of conductors with lamps connected across them, and suppose the conductors to be of the same cross-section from A to B, it is manifest that lamp 1 has less resistance between it and A than lamp 18 has.

(b) Let A' B' (Fig. 117) represent a different system. It will be seen by inspection that B gives an equal resistance all round and lamp 1 will burn with the same brightness as lamp 18, and this will

FIG. 115.

FIG. 116.

FIG. 117.

consider this formula in connection with electric bells. When the wires are well insulated the gap in the circuit at a push makes R for the voltages of such circuits infinite, consequently $C = 0$; no current flows and no bell rings. When the push is pressed, why does not the current become infinite, because now the resistance R between the points is 0? If we consider that there is a small charge of electricity at the + point this passes at once, and we may think of the action as that of a very large current for a very short time: the instant that the circuit is completed R does not stand for the resistance between the points but for that of the whole circuit, viz., the wires to the battery, the bell, the indicator and the battery itself; and E is now called electro-motive force. It is not easy to get a mental conception of electro-motive force. (I want to avoid the introduction of the subject of dynamos here, but students of electricity know that a constant current dynamo is a mechanical substitute for a primary chemical

steam engines, which, unlike the tiny generator—a bell battery—will answer any demand for power that may be made upon it. Consider an ordinary 16-c.p. incandescent lamp, assume its current to be .5 amperes and its difference of potential (the voltage between its terminals) to be 110, apply Ohm's law and we find $.5 = \frac{110}{R}$ $\therefore R = 220$. That is, the resistance of

the lamp is 220 ohms, and the energy that is converted to heat and light is 55 watts per hour, say (C E). Suppose that this lamp is on a circuit from the service, allowing for 1 volt drop, the resistance of this circuit if it were short-circuited at the lamp as a bell push short-circuits a bell circuit, the lamp being left out, if found by Ohm's law $.5 = \frac{1}{R}$ $\therefore R = 2$. Now

let us see what current we should get in this wire by short-circuiting a lamp, $C = \frac{110}{2}$

always be the case however many or few lamps may be in use, but each lamp will not burn so brightly when they are all "on" as when only a small number are "on." Reasonable uniformity can only be attained by making use of the considerations here suggested in a common-sense way, by a sufficiently liberal use of copper, and by arranging the installation in a sufficient number of independent circuits so that there will not be too great variations in the numbers of lamps in use in any one circuit.

It is possible to do very careless and unsatisfactory wiring without infringing the Fire Office rules. The Fire Offices are only concerned with the prevention of fire; the householder is concerned in getting fair value for the money he pays for electricity and for lamp renewals. With bad wiring the lamps burn too high when few of them are in use and too low when many are in use; high burning means numerous lamp renewals, low burning means very inefficient light for the "units" charged in the electricity bill. The way in which architects may control this matter is obvious. Specify that the drop in volts at any lamp terminal from the meter shall not exceed a given amount when all the lamps are turned on and that when lamps burn in small numbers the drop shall be a given amount.

When a building is wired in sections the terminals of each section should be brought to a switchboard located as close to the meter as possible and there should be switches and cut-outs for each circuit.

The student will find it useful to get some of the very well illustrated catalogues of electrical fittings and study them; he should also examine the fittings themselves, and he is strongly advised to examine carefully any electrically-fitted building which he is at liberty to examine, and if he can borrow a voltmeter he should try the voltages at lamp sockets when varying numbers of lamps are burning.

Electric Light.—There has been much said about the difference between *electric light* and *gas light*. Gas light is supposed to have a better fog-penetrating power, &c. As a matter of fact there is no difference in the light from gas burned as an ordinary flame and that from electricity: there is as much electric quality in the one as in the other; in both cases the source of light is heated glowing carbon. In incandescent gas burners the source of light is the glowing mantle and in the Nernst electric lamps the source is not carbon. But electricity gives a greater range of temperature in the glowing carbon. We have the very high temperature arc light, and there is a very great range in incandescent lamps, which may be burned as dull as ever we please. When burned dull, however, they are very uneconomical. Fog-penetrating power may be influenced by the smallness of the source in an arc light, or it may be a question of the refrangibility of the rays. It would appear that electric light may be obtained from as large a source as may be desired and of almost any refrangibility. The light from the incandescent filament of an electric lamp is no more electric than the light from a candle, from a bat'swing gas burner or from the flame of the fire.

High-voltage Lamps.—The drop in voltage on a given length of conductor is proportional to the current; for example, if the drop for a current of 100 amperes is 5 volts the drop for 50 amperes will be 2½ volts. Now, if the voltage at which the 100-ampere current is sent out is 100, the voltage at which it will be used between the terminals of a lamp is 95 and the watts usefully employed are $100 \times 95 = 9,500$ watts. But if the current is sent out at 200 volts, 50 amperes at 200 volts is equal to 100 amperes at 100 volts, but the drop in volts for 50 amperes is only 2½ volts, so that the power delivered to the lamp terminals is $50 \times 97\frac{1}{2} = 9,875$ watts, so that there is a considerable economy of energy in using the higher-voltage lamp. Instead of the loss of power being 5 per cent, it is now only 1.25 per cent., that is, one-fourth of 5 per cent. If we agree to the 5 per cent. loss of power we may reduce the copper in the conductor to one-fourth: that is, a 50-ampere current will have a drop of 10 volts and we shall have at the lamp terminals $50 \times 190 = 9,500$, as in the first example. Doubling the voltage on a system increases the power-conveying capacity of the conductors

four times, having regard to allowable drop of voltage at the lamps. Increasing the voltage has other consequences; the sparking distance becomes greater and better insulation is needed, but the reason why the voltage of lamps for central supply was at first made about 100 was connected with the manufacture of the lamps. If the filament of an 8-candle lamp for a voltage of 100 is doubled in length it will now give 16 candles on a voltage of 200, or if its cross-sectional area can be halved the same result will follow. It is now found practicable to make satisfactory higher voltage (220) lamps for candle-powers of 16 and more.

In large buildings it may be advisable to bring in the three-wire system from the three-wire supply, and it is advisable to say something on this subject. It is said above that doubling the length of an 8-candle lamp filament allows the voltage to be doubled, and it now gives light equal to that of two lamps; the same result will follow if we put two lamps in series across the higher voltage. The objection to this plan is that in all cases the lamps must burn in pairs and if either fails the other goes out. Consider Fig. 118. Three conductors come from the meter of the voltages shown. If all the lamps are burning there is no current in the conductor at 110 volts, except as may be needed to go from one lamp to the second of a pair, but if the balance is disturbed by, say, three 16-c.p. lamps of the outer ring being switched off, then a current of, say, 1½ amperes flows from the meter to the middle wire. On the other hand, if, say, four lamps of the inner circle are switched off, a current of 2 amperes will flow to the meter. As the middle wire is for a balancing current and as the lamps are arranged so that it is very unlikely that all those on one side shall be lighting when all the lamps on the other side are out, the middle conductor may be less in cross-section than either of the others. The quantity of copper in these conductors as compared with that in a two-wire installation with 110-volt lamps is about three-eighths.

The few elementary matters discussed above are the mental electrical stock-in-trade of a practical foreman of house-wiring. The house-owner, or the architect who is acting for him, may feel safe in the hands of very well-known reputable wiring firms, but there is a legion of wiring people: let us consider what checks are applied to them apart from their reputation. The Supply Company must be satisfied with the goodness of the work. It is the interest of supply companies to keep up the good name of electricity as a safe agent, and it was especially so at the beginning of its use; it is less so now that the public have settled in their minds an average sentiment of security, and, so far as the Supply Company is directly concerned, it is sufficient for them in the interests of their mains and services to see that the main switch and cut-out on the street side of the meter are right. Again, the Fire Office: it is its interest to see that the rules are complied with, but the Fire Office will accept a certificate from the Supply Company or even from the person who has done the wiring. If the architect is unable to judge of house-wiring there is no sufficient security.

In regard to the placing of lights and their decorative management there is nothing technically electric; it is outside the scope of this article.

The Newport (I.W.) Victoria Memorial.—The competition for designs for an island memorial to Queen Victoria, which it has been decided to erect on a site in the market square of Newport, has been decided in favour of Mr. Percy Stone, F.S.A., of Sandown, who won the premium of £25. About fifty competitive designs were received. The design submitted under the motto "Vectis" shows a memorial in the form of a Victoria Cross on a graceful column nearly 40ft. high, with a lantern of Gothic design surmounted by a spire and the cross. At the base of the column will be three figures, representing Dignity, Fortitude and Sympathy, supporting a crown, with three couched lions at their feet. The whole will stand on a circular base with four steps. The selected design possesses the unique characteristic that from whatever side the monument is approached its appearance will be the same. Two designs by London competitors were placed next in order of merit.

OLD AND NEW STAINED GLASS.*

By H. W. BACON.

STAINED glass is a subject upon which much may be said, but little that is new. Its history is lost in the midst of antiquity—of coloured glass there are in existence Egyptian beads and odds and ends more than 3,000 years old—and, if legends are to be believed, the Tower of Babel itself is responsible for the invention of glass by the vitrification of its building materials in the destructive fire consequent on its presumptuous existence, but one has to wait a considerable time after the Tower of Babel for any evidence of a stained-glass window.

The earliest date ascribed to any existing stained glass is to the tenth- or eleventh-century windows at Augsburg, but even this is doubtful, though it is more than probable coloured glass had been used for window purposes some time before.

The oldest we have in England dates from about the thirteenth century, but as in the development of stained glass we were always about a century behind our French neighbours I think we may fairly state that its use became somewhat general about the twelfth century. There is a good deal of it about that date remaining in various French churches. The first stained-glass windows were (paradoxical as it seems) of white glass, that is to say, of various tints of white glazed together into geometrical forms, technically called *grisaille*. Later, small pieces of coloured glass were introduced as centres of circles and other panels; still later, borders of colour were used to frame the lights; and gradually coloured glass ousted the white, until it could no longer be called *grisaille*. All this time no paint had been used: the effects gained were solely by the tint or colour inherent in the glass itself.

At this point the interesting discovery was made that opaque glass, or the component parts of glass in a raw state, might be finely powdered, mixed with water or other media, and painted with a brush on a sheet of glass, and fused by heat to its surface.

Until now the art had been that of the glazier; here the painter appears on the scene; and, simply at first and more elaborately later, natural forms begin to take their place in the window.

The painter's side of stained glass took greater and still greater prominence, the glazier's less and less, through the Early, Decorated and Late Gothic, through the Renaissance, down to the late seventeenth century, when the painter smothered the glazier, and the art became dead and buried.

The efforts of some later painters, notably Sir Joshua Reynolds, only prove how very dead it was, how little they understood of its *raison d'être*. Dead it remained until well into the nineteenth century, when came the elder Pugin. Thanks to him the dry bones were stirred, and though some of us are now inclined to smile at the early and archaic efforts of this master, yet we are compelled to admit that he, first among moderns, understood anything of the principles underlying stained glass.

I believe I am right in saying that almost all living stained-glass artists of repute trace their genealogical artistry to one or other of Pugin's protégés—Mr. Wailes, of Newcastle, or Mr. Hardman, of Birmingham. All-round progress has taken place since then; we have survived the dogmatism of a Pugin and the obstinacy of a Butterfield, until, perhaps, we are in danger of falling under a still worse régime—that of the crank.

Having thus lightly touched on the history and development of the subject, I should like to offer my conception of what a stained-glass window should be, the methods of its making, and a few remarks on present-day artists and clients.

My definition of a stained-glass window is something like this:—A mosaic of vari-coloured glass so designed as to fittingly decorate and emphasize its architectural framework—and at the same time to fulfil its other purpose, *i.e.*, the illumination of the building in which it is

* Summary of a paper read before the Society of Architects on February 20th.

inserted: a mosaic of vari-coloured glass sets aside all systems whereby colour is gained by means of enamel, paint, &c. It must be fittingly decorative—that is, the subject must bear some relation to the purpose of the building, not at all like the exterior of the chemist's shop illustrated in Newcastle Cathedral.

It must emphasize its stone framing; therefore each panel must be complete in itself. No picture running through a number of lights, ignoring all boundaries and mullions, is admissible. In addition, I think it should be readable, not a puzzle—so that an interested observer should be able to gather the main lines of its story at once, still leaving the articulation of the details to closer search.

I should like you to notice how the layman in these matters assumes that what is suitable in a

sary, limitation. I may be wrong and am open to conviction, for possibly the most exquisite examples of glass painting in existence ignore the rule, notably at Gouda, in Holland, where Gothic windows of many mullions were deliberately built for the reception of Renaissance glass. It must be confessed that in these magnificent works the presence of stone mullions is not even noticed; but that is my point, ought they not to be noticed? Possibly the truth is that in windows of the size of those at Gouda, the mullions are of no more consideration than stanchion bars—something on which to hang glass and prevent its collapse.

One often sees windows the apparent object of which is to darken rather than light the building—the large east window at St. Mathias, Earl's Court, is a case in point. To such an

glass-painter is usually but a workman, a mechanical copyist; on the Continent painters are really qualified artists and only need the roughest suggestions from the master-mind. In our country, therefore, the drawings must be elaborate and drawn with minute care: nothing can be left to the copyist's imagination, for the simple reason that generally he hasn't any, though there are exceptions.

The figure drawings are made in monochrome, charcoal, crayon, pencil, or bistre in wash, or in water-colour or pastel. Generally the lead glazing lines are shown on the drawing, but for the convenience of the cutter a tracing of these lines is made on linen.

Possibly the most important and delicate function in the making of a window now follows. Each piece of coloured glass must be chosen and cut to fit the shape on the linen tracing. In the case of purely commercial stained-window producers, the cutter, an ordinary British workman, is left very much to his own devices; but where artistic glass is aimed at the artist stands by the cutter, choosing each tint, each sheet, and even indicating the particular part of each sheet most suitable for his purpose.

This done, a tracer takes the glass in hand, marking on the pieces of glass the main lines of the artist's drawing. The colour used for this tracing and all subsequent painting on the glass is an opaque brown pigment, composed of the same earths as glass itself, with some iron or copper added to give opacity. The next process is to stick on to a sheet of plate glass with hot wax all the pieces placed in their proper order and position, and the whole is then covered with a fairly thick coat of the pigment, and, while still wet, stippled to let the light through. When dry, by means of an odd assortment of tools—needles, quills, bits of stick and hard hogshair brushes—the lights and half-tones are picked out or brushed away; here and there a shadow needs strengthening with more pigment, and the work is ready for diapering and staining. The diapers or patterns on the drapery are done in two ways, sometimes painted on in thick opaque lines, and sometimes the existing paint is etched out with points to the required design. The staining consists in painting the back of such portions of the glass as seems desirable with nitrate of silver, which when sufficiently heated turns a pure brilliant yellow and can very easily be so manipulated as to give the very palest lemon shades or the deepest orange, almost red.

The pieces of glass are now all dismantled and carefully laid flat on iron trays, no piece touching another, inserted into a kiln, and gradually heated to a white heat and as gradually cooled. The pigment is now just as much a part and parcel of the glass on which it was painted as if it had been originally made in that condition. It is itself no longer paint, but glass, and can only be separated from the surface by the action of hydrofluoric acid.

The glazier now takes the work in hand and sorts out this seemingly hopeless jumble of odds and ends by means of the cutter's tracing linen and joins them all together by grooved leads and solder. Cement is rubbed into the leads on both sides and pieces of stout copper wire are fastened in place which will ultimately be twisted round iron bars in the stonework.

It is a constant wonderment that, while art in almost every form is becoming more refined and respected, the art of glass painting and staining should be so largely a matter of trade, and sometimes not even being subject to ordinary trade standards of morality. If you will look up in the directory the names of so-called stained-glass artists you will come upon firm after firm not one of whose members can even draw, while every year in the Royal Academy there are designs for windows hanging on the walls signed by men who have done nothing but pay for them.

The Administration Cottage illustrated on this page was designed for the nursing staff in connection with the Frimley Urban District Council's proposed isolation hospital, in respect of which application is to be made to the Local Government Board for sanction to borrow £3,500. The walls on the ground floor will be built in red bricks, whilst the upper portion will be covered with rough-cast and the roof with Reading tiles. Mr. F. C. Uren, surveyor to the Council, is the architect.

GROUND PLAN.

FIRST-FLOOR PLAN.

SKETCH DESIGN FOR ADMINISTRATION COTTAGE, FRIMLEY URBAN DISTRICT COUNCIL ISOLATION HOSPITAL. F. C. UREN, ARCHITECT.

picture on canvas is and must be suitable as a decoration in glass: an error in which, curiously enough, he is supported by the great writer on glass, Winston, who in his monumental work says in effect that nothing is admissible in glass but what is admissible on canvas. Speaking for myself and many contemporary workers, it seems nearer the truth to say nothing is admissible in glass which is admissible on canvas.

Another of my rules says the subject of decoration must be complete within the limits of its framework—by this I mean that no picture should over-run the stop set by stone mullions or overflow into tracery. This is a rule, if rule it be, quite as generally broken as observed. I am well aware that many if not all modern glass-painters have no hesitation in carrying one design through five or more lights. I know perfectly well that examples of old work of similar character are numerous.

Yet I feel that proper recognition of the architectural stonework is a legitimate, even a neces-

sary, limitation. I may be wrong and am open to conviction, for possibly the most exquisite examples of glass painting in existence ignore the rule, notably at Gouda, in Holland, where Gothic windows of many mullions were deliberately built for the reception of Renaissance glass. It must be confessed that in these magnificent works the presence of stone mullions is not even noticed; but that is my point, ought they not to be noticed? Possibly the truth is that in windows of the size of those at Gouda, the mullions are of no more consideration than stanchion bars—something on which to hang glass and prevent its collapse.

I now propose to describe briefly the course of execution of a painted window.

To begin at the beginning, as soon as the exact shape and proposed subject are known a water-colour sketch or design is prepared to scale, and here a preliminary difficulty often presents itself, the question of cost. It is really absurd to merely state a given size and then ask the cost, as some architects have been known to do. Stained glass may cost anything, for the cost depends on many and various considerations, chief among them being the standing of the artist employed. No sane person would write to a bootmaker, "What is the price of a pair of boots, size No. 7?"

This question of cost settled, the design is made, then the full-size working drawings. In England, unhappily, though the resultant glass is now the best in the world the actual

Bricks and Mortar.

APHORISM FOR THE WEEK.

The houses of Pompeii were second-rate performances in their age, but for wealth of art throughout them, and unity of design down to the smallest details, our richest mansions cannot compare with them.—J. J. STEVENSON ("House Architecture").

Our Plates. CLEGG HALL is about two miles from Rochdale, in the Littleborough direction. It was built by William Asheton about the latter part of the reign of Queen Elizabeth. The bold portico at the front was built later, no doubt in the reign of William. It is of Renaissance design, but the details are coarse. There is a sketch of the Hall in Gotch's "Early Renaissance Architecture" recently published.—The vicarage of St. Mary's, Plaistow, was built some years ago for the Rev. T. G. Wilson from designs by Mr. Arthur C. Blomfield. The work was carried out by Messrs. Cornish & Gaymer, of North Walsham, and the house is built of red brick and hanging tiles.—The two farmhouses in Sussex were designed for a gentleman who owns a large estate in that county and who proposes to subdivide it into smaller farms than those at present existing. The houses are designed to be carried out in local red bricks and tiles, with half-timbered gables in oak.

York Architectural Society. THE "Report of Proceedings" of the York Architectural Society for 1900-1 includes the correspondence entered into by this Society and the R.I.B.A. in reference to the decision of the York Corporation to erect a lunatic asylum from the designs of the city engineer. Whilst disclaiming any personal objection, or wishing to suggest anything detrimental to the city engineer, the Society pointed out that "(a) the plainest buildings need architectural treatment in order to secure avoidance of the commonplace; (b) a building of the asylum class demands special knowledge on the part of the designer, or experience may be dearly bought by trouble and cost in future adaptation and administration; (c) the increasing demands upon the time and energy of the city engineer would indicate that it is improbable that he will be able to do full justice to the work, and the result of this must be the practical delegation of the responsibility to some special assistant." The protest however was in vain, for the York City Council decided "not to depart from the course of action they have already taken." The "Report of Proceedings" has as frontispiece an illustration of the south facade of Castle Howard, while the prize list for 1902 includes one of £1 ls. for the best sketches and memoranda made at the visits of the Photographic and Sketching Section, and two of £3 3s. and £1 ls. respectively for the best designs for a small fever hospital.

Church Art. THE Church Crafts League held its first general meeting of the year last Monday week in the hall of Clifford's Inn, when Mr. Roger Fry gave a lecture on "Art Patronage of the Church in Italy during the Fifteenth Century." At the conclusion of the lecture Mr. Charles Holroyd (Keeper of the Tate Gallery) said it was the custom in the fifteenth century for a wealthy family to make itself responsible for the decoration of a certain portion of a church and to employ the best artist it could procure to carry out the work. He thought that some such plan might be adopted now with good results. Mr. Selwyn Image protested against the idea that one man must be responsible for all the decorative work of a church. If real artists were employed they would all be actuated by the same spirit, and the result of work done in such a way would not be lacking in unity of purpose. Mr. Henry Holiday briefly mentioned the drawbacks under which modern artists had to learn the technique of their art. Instead of being taught in schools by the best men of their day, the young artists had to spend years of independent labour in mastering technical difficulties.

A Scottish Architect. MR. DAVID MACGIBBON, LL.D., architect, of the firm of Messrs. MacGibbon & Ross, of Edinburgh, died last week in his seventy-first year. Mr. MacGibbon had been in feeble health for two years, and had been taking no part in professional work for the past year. Educated at the High School and at the University of Edinburgh, he learned his profession in that city and in London. He travelled a good deal on the Continent, in Italy, France and Spain, and the fruits of his travel and ripe scholarship were shown in the publication which he brought out in collaboration with his partner, Mr. Thomas Ross. The work extends to eight volumes, and deals with the castellated and domestic architecture of Scotland and the ecclesiastical architecture of Scotland. Recently Mr. MacGibbon published a large book, for private circulation, on "The Abbeys of Galloway," and also a volume on "The Architecture of the Riviera." Mr. MacGibbon likewise contributed many papers to the architectural institutes, both in London and Edinburgh. Several of the finest buildings in Edinburgh were designed by Mr. MacGibbon. He was the architect for the Merchant Company, and, besides designing their schools, he was responsible for the laying-out of their feuing grounds. Many of the buildings of the National Bank of Scotland throughout all parts of Scot-

234ft. in height, but in the reconstruction it was considered advisable to materially reduce the length. St. Bride's was opened in 1680, but the tower and spire were not added until 1701-1703, this completion bringing the cost of the church up to £11,430. In the reconstruction which has now been undertaken the spire will remain at the altitude at which it has existed since 1764.

Last Year's Work on at Caerwent. The excavation work carried on at Caerwent in 1901 consisted mainly in the excavation of the west wing of house No. 2 and the whole of house No. 7 in the nine-acre field in the south-west quarter of the city. The two houses were of unusual interest. They were both large houses of the courtyard type, but they differed from the type commonly found at Silchester in having suites of rooms arranged round all four sides of the central court, whereas at Silchester the courtyard type of house usually has rooms on three sides only. In house No. 2 a large and very interesting hypocaust was found in which the *pila*, each formed of a single stone, actually rested on a tessellated pavement (still intact) of the earlier house. This hypocaust was doubly interesting owing to the fact that the floor and the overlying pavement were still *in situ*, and afforded a good example of the method of sup-

THE BEFREIUNGSHALLE, KELHEIM, BAVARIA.

land were erected from his designs. In Edinburgh his work is to be seen in several of the fronts in Princes Street, in the Caledonian Insurance Company's office in George Street, and in the Theatre Royal. Mr. MacGibbon was an accomplished draughtsman and a water-colour artist of some repute. About two years ago the University of St. Andrews conferred upon him the honorary degree of LL.D., in recognition of his artistic attainments.

St. Bride's Steeple.

THE steeple of St. Bride's, the body of which church has heretofore been hidden behind some of the Fleet Street shops, and is now masked by hoardings which conceal the operation of widening the thoroughfare, is at the present moment shrouded in scaffolding. For many months the necessity of repairing some of the masonry has pressed upon the Charity Commissioners, and it has now been decided to rebuild some section of the spire, and to otherwise make good the ravages of the smoke and weather of London. At the same time the London sparrow is accountable for more mischief to the buildings of the metropolis than is usually laid to his account, and the ringing of bells also makes strains upon the masonry wherein they are hung. This will be the second time that the steeple of this interesting work of Wren will have been restored. It had to be rebuilt in 1764; when it was struck by lightning and seriously damaged. At that time it was

porting the floor. A portion of the hypocaust has been removed and re-erected in the temporary museum. The other most important features in this house were a channelled hypocaust and a series of small baths, in one of which the leaden drain-pipe was still to be seen as it passed through the wall. The chief features of interest in house No. 7 were a small partially detached building, which may have been a shrine, and two rooms (separated no doubt only by a curtain when the house was in use) which contained a tessellated pavement in which were busts of the Seasons and figures of animals and of cupids. Underlying this pavement, which was of late and inferior workmanship, was another (of the earlier house) constructed with far more care as to detail and finish. In both these rooms the walls were standing to a height of nearly 3ft. above the floor level, and the plaster on the walls was nearly intact. It was, therefore, fortunately possible to recover to a considerable extent the colour and design of the wall decoration. Among the various objects found, perhaps the most interesting was a small plaque of thin bronze containing in high relief a female head. It is hoped to resume work early in this summer; but the funds raised last year have all been expended, and it will be necessary to raise a large sum—at least £300—to enable the committee to complete the excavation of the nine acres already in their occupation. Subscriptions for this year should be sent to the hon. treasurer, Mr. A. E. Hudd, F.S.A., 94, Pembroke Road, Clifton, Bristol.

THE L.C.C. WORKS DEPARTMENT.

BEFORE the London County Council sat last week a portrait of Mr. W. H. Dickinson (chairman 1900-1), executed by the Hon. J. Collier, was unveiled in the library.

A report was brought up by the General Purposes Committee dealing with the Works Department, and making the following recommendations: "(a) That an advertisement be issued inviting applications for the appointment of Manager of Works, and that the salary to be attached to the position be £1,500 a year as at present; (b) that a standing Committee, consisting of seven members, be appointed for the supervision of the Works Department, and that such Committee be styled the Works Committee."

Sir John Dickson-Poynder, M.P., moved, as an amendment: "That the Works Department should only be continued for the purpose of completing the works in hand, and no new constructive works be undertaken, and accordingly that it be referred to the General Purposes Committee to report fully as to the appointment of a temporary manager." If he had his own way he would wind up the Department tomorrow. But, of course, this could not be done. Nearly £750,000 worth of work was now being carried out by the Department, and he proposed that they should all co-operate together to carry out that work on the clear understanding that

of £7,000. On jobbing works there was a large saving, and the result was that the total excess on the work carried out under the present management was only £377.

After further discussion the amendment was defeated by a large majority. Other amendments to appoint an Advisory Committee to consider the question of the reorganisation of the Works Department prior to the appointment of a new Works Manager, and to substitute £1,000 for £1,500, were lost.

Ultimately both recommendations of the General Purposes Committee were carried.

Surveying and Sanitary Notes.

Sir Alexander Binnie will preside over the engineering and architectural section at the congress to be held by the Sanitary Institute at Manchester in September next.

The Widening of Piccadilly near the Circus is not to be undertaken just yet, as the cost would be something like £250,000. The Commissioners of Woods and Forests decline to assist the London County Council in the matter.

Bacteria and Sanitation.—At a large meeting of the Devon and Exeter Architectural Society held

cussion was joined in by Mr. C. J. Tait, Mr. C. Cole and Mr. O. Ralling.

Builders' Notes.

Mr. George Hall, partner in the firm of Messrs. John Hall, builders, contractors and owners of extensive stone quarries, Gorses Quarry, Bury, died recently.

Mr. Samuel Thomas Watton, senior partner of the firm of Messrs. T. Watton & Sons, builders, Tamworth, which was established by his grandfather over a century ago, died recently.

Re W. Antill & Co.—Last week E. A. Young, one of the partners in the firm of W. Antill & Co., builders, of Mornington Crescent, N.W., who failed in August last, was granted his free discharge.

Mr. Tyrer Connard, builder, of 125, Hampton Road, Southport, died recently at the age of thirty-one. The late Mr. Tyrer Connard carried on the builder's business of nearly forty years' standing in which he had followed his father, the late Mr. Walter Connard, and which has been associated with the erection of many important buildings in the town.

Mr. A. Hughes, an official of the Wirral District Council, has been appointed chief buildings

NEW INFIRMARY, BRUNSWICK SQUARE, CAMBERWELL, S.E. EDWIN T. HALL, F.R.I.B.A., ARCHITECT.

no new work should be placed with the Department. He was opposed to placing the work under the Architect and Engineer, as some members proposed, because the appointment of a manager was the only check over the Works Department. In the last five years the Department had carried out £700,000 worth of work for the Housing Committee, and the excess over the measured value and the detailed prices of the officers was no less than £65,000. But the officers' prices were based on the fact that there would be a profit to the contractor, so that not only did they lose the theoretical profit, but they lost £65,000 which was irrecoverable. On the other hand, contractors had carried out £187,000 worth of work for the same Committee, and the saving on the officers' estimates, based on the quantities and detailed measurements, was over £15,000. He considered they had enough experience now to make it perfectly clear that the contract system was the best. He was convinced that a gigantic labour bureau controlled by a municipality was impossible.

Mr. Beachcroft, in seconding the amendment, said the reason that the Works Department had failed was that there was lacking the incentive of gain.

Lord Welby said that, taking the works begun, carried out and completed by the Works Department under the present management in the last four and a half years, they found that estimated works of the value of £466,000 were done at a cost of £473,000, which was an excess

on February 18th, the president, Mr. H. G. Luff, A.R.I.B.A., of Devonport, being in the chair, a lecture on "Bacteria in relation to Sanitation" was delivered by Dr. Ransome Pickard. After dealing with the classification of forms and reproduction of bacteria, the lecturer proceeded to describe their functions in the process of decomposition, especially with regard to the microbic action in the purification of sewage as brought into play by the septic tank treatment. Important points with regard to hospital construction were traversed, attention being drawn to the production of spores and the difficulty of dealing with them and of destroying some of the bacilli with ordinary means of disinfectants, and the precautions adopted in the modern operating theatres to guard against infection. Ventilation was discussed and the problem of sanatoria, which is being increasingly forced upon the attention of the public and the medical profession at large, who however were not quite decided as to the question of the best sites. In the discussion that followed the president referred to the provision of plate-glass linings to the walls of operating theatres. Mr. Jerman mentioned that in some recent reports at Leeds, &c., it was stated that the closed tank was unnecessary for the sewage purification, which was equally well dealt with by direct application to the filter beds. Dr. Pickard in reply said he was of opinion that the breaking down of the organic matter would proceed more rapidly and effectively in the closed tanks. Further dis-

inspector to the Manchester Corporation. The vacancy was caused by the appointment of its former holder, Mr. W. Wilson, as chief inspector of dangerous buildings.

Scaffolding under the Workmen's Compensation Act.—A slater's labourer named Marshall, whilst carrying slates up a ladder at Scarborough, fell and fractured his skull and thigh, and his leg had afterwards to be amputated. The judge disallowed the claim for compensation. The applicant was going up a ladder with slates, and a man on the roof, doing repairs, was working without a platform, plank or ladder. His Honour could not, therefore, say the building was being repaired by means of scaffolding.

The Dundee Building Trade is at present experiencing a period of acute depression. Partially owing to general stagnation in the property market, and in a greater degree because of the recent severity of the weather, building operations in all branches have been practically at a standstill, and many tradesmen in consequence find themselves out of employment. Masons in many instances have been idle for three months, while slaters and others engaged in allied trades are in a somewhat similar position. It is the joinery trade, however, that has felt the pinch most acutely.

The Yorkshire Master-Painters' Federation held its annual meeting recently at Bradford. The principal business was the election of officers for the ensuing year, which resulted as follows:—

quarter supplied to a customer in any one establishment.

Institution of Mechanical Engineers.—The fifty-fifth annual general meeting of this Institution was held last week, the president (Mr. W. H. Maw) occupying the chair. The annual report stated that at the end of 1901 the membership was 3,491, compared with 3,165 at the end of the previous year. The progress which had been made by the Institution since its establishment in the new quarters at Storey's Gate had been in every way most satisfactory. The total revenue for the year was £9,306 and the expenditure £9,115. Mr. Maw was re-elected president.

Italian Renaissance Brackets.—The two brackets illustrated on this page belong to the "early" period of the style. The design of the Venetian example is very suggestive of that city's intimate association with the sea, and the other is not less interesting as a treatment of sculptured ornament on constructive lines. The stone is dark grey in colour, apparently limestone. Both brackets are in the Victoria and Albert Museum, South Kensington. The drawings are by Mr. F. R. Hiorns, A.R.I.B.A.

President, Mr. F. J. Pickersgill, Leeds; vice-president, Mr. W. Garside, Leeds; hon. secretary, Mr. J. Tetley, Huddersfield; hon. treasurer, Mr. G. Spencer, Bradford. The headquarters of the federation during the year will be in Leeds. In connection with the apprentices' prize competition Mr. J. Harland, of Bradford, promised a gold medal as an extra prize for next year, and a promise of a silver medal was made by Mr. W. Simpson, of Hull.

Engineering Notes.

Mr. J. D. Cormack, B.Sc., Professor of Mechanical Engineering at University College, has accepted the position of Honorary Consulting Engineer to University College Hospital.

Second Assistant Engineer, Metropolitan Asylums Board.—Applications for this appointment must reach the clerk at the offices of the Board, The Embankment, not later than March 3rd.

Accepted Tender for Widening London Bridge.—The Court of Common Council last week accepted the tender of Messrs. Pethick Brothers, of Plymouth, for widening London Bridge, subject to certain conditions, at a cost of £95,484 12s. Further sums of £700 and £1,000 were also voted to repair the carriageways of London Bridge and Blackfriars Bridge respectively.

Ventilation of Factories and Workshops.—The Home Secretary has issued an order prescribing that the ventilation of every textile factory in which atmospheric humidity is artificially produced by steaming or other mechanical appliances, and in which special rules or regulations with respect to humidity are not for the time being in force, shall be such as to supply during working hours not less than 600 cub. ft. of fresh air per hour for each person employed.

Municipal Electrical Supply in Liverpool.—The report of the Liverpool City Electrical Engineer (Mr. A. B. Holmes) to the members of the Corporation supplies some remarkable figures in regard to the rapid development of the municipal electrical enterprise in that city, the aggregate output of the past year being no less than 20,018,166 units, which Mr. Holmes believes to be greater than that of any other electrical undertaking in the United Kingdom. Of this total 6,235,658 units were for lighting and power and 13,782,508 for tramways. In 1898 the total was 2,915,695 units, in the following year 5,729,477 units, and in 1900 11,564,335 units. Mr. Holmes deals only with the electrical work, but mentions that more than 380 electric tramcars are now running in the city. Electrical energy for lighting and power is

supplied throughout the city at a pressure of 230 volts. Over a considerable area the supply is on the three-wire system, which affords for large motors a supply from the outer conductors at a pressure of 460 volts. The pressure of the tramway supply is 500 volts, and each of the steam dynamos in the new stations can be used for either service. This enables each set of plant to be run approximately the same number of hours per annum, the "stand by" plant being reduced to a minimum. With this arrangement it has been possible to generate electrical energy in the form in which it is distributed and used—that is as "direct" current at a pressure of 460 to 500 volts. This avoids the necessity for capital expenditure on transforming apparatus and also prevents working losses incidental to transformation. The Electrical Power and Lighting Committee, on Mr. Holmes's recommendation, have decided to reduce the charge for electrical energy from 4d. to 3d. per unit for any energy in excess of 3,000 units per

Views & Reviews.

A New Dictionary of Architecture.

From its very nature a dictionary of architecture is sure to meet with a great demand, for the only other similar dictionary in English is that eight-volume one begun about 1850 and finished ten years ago. Of glossaries there is a goodly supply, but a cheap and compendious dictionary has been badly needed. Dictionaries there are, of course, in foreign tongues, but the difficulty of consulting them is considerable. Encyclopædias or cyclopædias do not possess the essential feature of a dictionary—the alphabetical arrangement in detail.

This dictionary, however, is doubly welcome, for not only does it supply a need, but does so most admirably. Dictionaries cannot be expected to be complete when first in the field; they must grow gradually, and the first labour is immense. Thus, Mr. Russell Sturgis has had little to guide him or to refer to in compiling this work. He has had the co-operation of many experts, however, and though the definitions seem somewhat personal and contentious from the want of crystallization that comes from general acceptance, this is somewhat compensated for by the additional interest this provokes, so that the book becomes a real pleasure to read consecutively and not only useful for consultation.

The illustrations have met with adverse criticism, but it seems to us that sufficient consideration has not been given to the difficulty of obtaining artistic drawings, and the very great expense that would be entailed in having them redrawn; and, after all, these serve their purpose in nearly every case, being clearly explanatory.

In order to facilitate reference, a dictionary must combine the two features of alphabetical arrangement carried to minute subdivision, with cross-references in abundance; but one of the greatest advantages of this work is that it enables one, by consulting one term, to find its related words or the terms of its subdivisions. Thus, in the matter of Columnar Architecture it is sometimes desirable to find out quickly the proper term for the colonnade of seven columns, but no dictionary gives this unless elaborated as we have said; Sturgis's dictionary, being so elaborated, does so.

There is one criticism that must be made against the work, and that is, there is no proportion preserved between the information afforded in the definitions. Some of the definitions are extended to such length as to be more in the nature of articles in an encyclopædia, whereas other constructional terms are given the barest explanations, hardly fuller than would be found in a general dictionary. The definitions of materials and workmanship are extremely bald in the majority of cases, whereas decorative works and motives are dealt with at great length. This want of proportion is a relic of the misunderstanding of the essential elements of architecture which has been general for so many years, and of course we have so much more information available on the decorative side than on the constructive.

In Vol. I, Prof. W. R. Lethaby contributes a most interesting and suggestive article on design, in which he takes the evolutionary view which has been somewhat ambiguously spoken of as "functional" or "organic." In dealing with the subject of proportion, however, he inclines to the opinion that the only rule is fitness. But there is something more than this; there is the same harmony which is the essence of music, poetry and painting. The word "proportion" has been wrongly used, but with all the mistakes of ancient writers they understood this element of architecture. Mr. Lethaby sees this, only he chooses to deal with it under the headings—symmetry, order and unity. He says, "The general law in regard to these considerations is the desirability of order, which itself is based on convenience and on ideas derived from the harmony in nature's order." It is all very well also to refer to the "sweetening" of the lines in Greek architecture, but this is only naming the result or means, not the cause or reason.

"A Dictionary of Architecture and Building: Biographical, Historical and Descriptive." Edited by Russell Sturgis, A.M., Ph.D. In three volumes, price 25s. each, nett. London: Macmillan & Co., Ltd.

Who Built the Pantheon?

The object of the author of this little book is to prove that the portico and the rotunda of the Pantheon at Rome were not both built by Agrippa in B.C. 27, but that the Romano-Greek *pronaos*, which bears the inscription of Agrippa, was part of a temple destroyed and replaced by the present circular building with its 28ft. opening in the dome 140ft. above the pavement. Fergusson said he felt convinced that the rotunda was much more modern than the portico and that it seemed more reasonable to ascribe its construction under the Tarquins than during the reign of Augustus. Our author says: "In every case, setting aside the Pantheon, the *cella* attached to the portico is quadrilateral; there is no instance of the combination of a Greco-Roman facade with a cylindrical drum": and he adds that neither of the cornices of the drum is coincident in height from the ground with that of the portico, an inconsistency which no designer of the two portions could have deliberately created. Pliny, Dion Cassius and other writers are referred to, but they furnish nothing absolutely conclusive, and we are left in the end with an unproved case: though it seems feasible the author's contention is correct, that the rotunda was first built in the days of Septimius Severus, more than two centuries after Agrippa's death.

"The Pantheon at Rome: Who Built It?", by James Thomas. London: Swan Sonnenschein & Co., Ltd., Paternoster Square, price 2s. 6d.

The Perplexing Act.

To make it at all comprehensible, the Workmen's Compensation Act has needed to be bolstered by innumerable law decisions, annotated and explained in numerous books; and even now there are many points about it which are obscure and difficult to define. This book sets forth concisely the scope of the Act as determined by recent legislation and as extended by the amendments introduced by the Factory and Workshop Act, 1901. It is pointed out under the heading of "Building exceeding 30ft. in Height, &c.," that in the latest case on the subject one of two adjoining houses was being demolished, and at the time of the accident was only 11ft. high, but as the party wall, which exceeded 30ft. in height, was left standing it was held that there was evidence to justify a finding that the house was over 30ft. high. It should also be noted that a building is "being constructed" until all the scaffolding used for the purpose of construction has been taken down; and also that the term "scaffolding" is not confined to what is generally known as such, but applies to internal scaffolding as well, including also an internal staging of planks and trestles, without poles: in fact, as the author observes, it is doubtful whether a ladder may not be "scaffolding" if used to stand on for executing repairs. Another point to note is that if a building exceeding 30ft. in height is being constructed or repaired with the aid of scaffolding, not only those actually engaged on the scaffold but all the workmen employed on or about the building come within the scope of the Act. This book explains all these and other matters in a brief and lucid manner.

"Outline of the Law relating to Workmen's Compensation," by William Bowstead, barrister-at-law. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd., 4, Stationers' Hall Court, price 1s.

A Pocket-book of Architecture.

Some men have found it difficult to write a history of architecture in several large volumes. Mr. P. L. Waterhouse does it in a book small enough to be easily slipped into the pocket. The book is of the same series as "The Story of King Alfred," "The Story of Euclid" and "The Story of Fish Life," and it is a pity that it was not enclosed between a more attractive cover, for at first sight it reminds one of the nursery. However, on turning the pages it will be found that the author has done his task very admirably. It is difficult to trace the development of architecture in 200 small pages, illustrated here and there with tiny cuts: and Mr. Waterhouse has done wisely to append a selected list of books for those who would further study the subject. We think however he might, even with the limits imposed on him, have given a little more space to modern architecture, as six pages can hardly be called sufficient for dealing

with the whole of the nineteenth century, especially when two pages of these are occupied by the sky-scraper: Romanesque architecture gets nineteen pages, Gothic thirty-eight and Renaissance thirty-six. The book is of course intended for popular consumption and as such it suits its purpose admirably. Considering that it can be obtained for ninepence nett, it is remarkably cheap.

"The Story of Architecture," by P. Leslie Waterhouse, M.A., A.R.I.B.A. London: George Newnes, Ltd., price 1s.

Velazquez.

Within the last few years a great deal has been written of Velazquez, and the exhibition of his wonderful pictures has made them familiar to the public as well as to the connoisseur. In this monograph, which should find a ready sale, technical criticism has been eliminated as much as possible, the author's object being to present a faithful history of the life and works of Spain's greatest artist, and to give some idea of his personality, and of the strange world by which he was surrounded; a number of half-tone reproductions of the artist's most important pictures serving to illustrate the letterpress. The bibliography at the end of the book and the list of those in possession of Velazquez's works are both interesting and valuable.

"Velazquez: His Life and Works," by Hugh Stokes. London: The Art Record Press, 144, Fleet Street, price 1s. nett.

The Newest Architecture.

In "The Artist" for February, which is a most interesting number, Mr. Harry S. Curry discusses the architectural and decorative details of the "new style" evolved during the last few years. The first is a very tall attenuated pilaster or pillar which can be of 1 or 100 diameters, or more if required; and next comes the very flat moulded cap which "forms, crowns, stamps, seals, consecrates, and alone, of and by itself, constitutes the architectural order of this supreme modern art." This is the W.D.P. ("well deserving pillar") of universal distribution. Thirdly, we come to the form of arch used, "simple but graceful in outline," and fourthly we arrive at that very important element in the new art—the teasing-fork, or T.F. For any scheme the T.F. symbol is indispensable and must be completely mastered "in all the serpentine sinuosities of each individual tail ere any attempt be made to design." Mr. Curry illustrates many forms of it, such as the flower T.F., the hinge T.F., the Noah's Ark tree T.F., or the candelabra T.F. Usually it has flowers or buds "growing on the prongs, with a leaf or two on the stem." Other details of the style are perforated hearts, and panels with inscriptions ("The Panels are Coming"); the latter however are not carved but ornamented with hammered copper-work or gesso. As to furniture, this is of plain or green-stained oak with copper fittings, or the most effective and latest use of metals, rusty steel. The W.D.P. is often introduced, being made taller and taller still, with a candle-socket on the top, or a rusty steel lamp having very thick, green, streaky glass. The influence of the style on the exterior architecture is very marked. Long, high, sloping buttresses are placed "at such odd corners and angles as are best calculated pleasantly to surprise the spectator"; the windows are long and narrow and are so arranged "that you cannot see out with comfort either standing or sitting"; the chimneys are about twice as large "as would besem any ordinary house to entertain, and on the front and back should be fixed large wrought-iron Ss"; while the roof should be large enough for the upper storey to disappear into it and be lighted by quaint dormer windows. Finally, the house is painted white all over, with the exception of the roof, which is tiled, and the shutters, which are painted a grass-green colour and perforated with hearts in the centre.

Mr. Curry's article is illustrated by a number of amusing sketches.

"The Artist." London: 27, Chancery Lane, price 1s.

A Leeds Competition.—Mr. John Lane Fox, architect, of Bond Street, Dewsbury, and 28 East Parade, Leeds, has been successful in winning the premium of £30 offered by the Leeds Corporation for the best design of public baths to be erected at Bramley. Mr. Leonard Stokes, F.R.I.B.A., of London, was the assessor.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Books on the Cross.

SUNDERLAND writes: "Is there any book published dealing with the 'Cross,' showing its development and symbolic meanings, &c., in the Latin, Greek, Celtic and other styles?"

The only two books on the subject are "Cruciana: Illustrations of the most striking aspects of the Cross of Christ," with cuts, 8vo, 1855, scarce (to be obtained for 9s. 6d. from Mr. B. T. Batsford, 94, High Holborn), and Tijaet's "Cross in Ritual Archaeology and Art" (Batsford, 3s. nett).

The Institute of Patent Agents.

LONDON.—AN OLD READER FROM ABROAD writes: "How can I become a Fellow of the Institute of Patent Agents or a Chartered Patent Agent (are these two names used for the same body)? I am going abroad, and I am told that it would be to my advantage, as a member of the architectural profession, to become a member of the Chartered Patent Agents."

We fail to see how becoming a Fellow of the Chartered Institute of Patent Agents can be of use to an architect going abroad, but, for your information, we may state the following particulars. The examinations conducted or recognised by the Institute are for (a) the registration of patent agents, and (b) the admission of Fellows, Associates and Students. Twelve examinations held under various bodies—such as matriculation at any of our universities, first-class College of Preceptors, or Associate, King's College—are recognised as preliminary examinations, the full list of which can be obtained by applying to the secretary of the Institute at 19, Southampton Buildings, Chancery Lane, W.C. Once a year (generally in November) a Final Qualifying Examination is held for enrolment on the Register of Patent Agents (the candidate must have been for at least seven consecutive years in a registered patent agent's office, or be a solicitor, or have passed one of the above-mentioned preliminary examinations). This final examination qualifies as Fellow, while Associateship is also secured by it, subject to the candidate having passed satisfactorily in certain subjects. The entrance fee is one guinea.

Mastic Joint between W.C. Pan and Soil Pipe.

SALOP.—J. J. writes: "Kindly describe a mastic joint to w.c. pan and lead soil pipe where an S. trap is used?"

There are several preparations in the market for making a mastic joint between an earthenware w.c. basin and the lead trap, so that the actual details connected with making the joint vary according to the character of the material used. Messrs. Dent & Hellyer, Newcastle Street, Strand, W.C., supply an "elastic cement" at 1s. per tin for bedding the basin of their wash-down closet upon a lead-trap pedestal. The directions given for making the joint are as follows:—"Make a grummet (or ring) of hemp, soak it in hot 'elastic cement' and place it around the outlet of the basin against the projecting bead formed there to retain it in its position. Warm the lead seating and bottom of basin, spread some warm 'elastic cement' over each, place the basin in the seating, and, whilst continuing to warm the basin and seating, work the basin down carefully until firmly bedded and quite level. Care should be taken that the grummet placed around the outlet of the basin does not allow any of the cement between the basin and the seating to ooze into the trap." It should be borne in mind that a mastic joint is not suitable for making a direct connection between a lead soil-pipe and an earthenware closet-trap. A joint of this description should be made by means of a brass thimble or socket soldered to the soil-pipe, the outlet of the earthenware trap being then

inserted into the brass socket, and the joint carefully made good with neat Portland cement. T. E. C.

Roofing over Yard.

M. S. T. M. writes: "The accompanying plan (not reproduced) shows a piece of land which it is proposed to roof over for use as a cart shed. Kindly give the class of roof and columns necessary, together with full details of construction. The 18in. stone wall must be kept down to one level; its present height from the surface of the ground is 8ft. 3in. The portion of the shed from A to B has to remain open, the roof to be supported on cast-iron columns. The 1½ brick wall may be finished off on the slope and built to any height as required. The height from the surface of the ground (which may be taken as level) to the underside of the tie-beam or lowest part of the roof truss to be 8ft."

It is not the purpose of these enquiry columns to give full working drawings in any case, but merely to give assistance in general principles or upon points of detail. Competent architects can always be found in the neighbourhood who will be willing, for a reasonable fee, to supply suitable designs or working drawings. In the present case a length of 127ft. 3in., with a width of 22ft. 10in. for about half the length, reducing suddenly to 21ft. 6in. in the middle and tapering gradually to 13ft. at the other end, is to be roofed

ROOF FOR CART SHED.

over for a cart shed, a length of 60ft, on one side being supported upon cast-iron columns. For this latter part six cast-iron columns may be provided, 10ft. centre to centre, carrying King-post roof-trusses. The height being 8ft., the columns should be solid cast-iron of 3in. diameter, or hollow columns 6in. diameter and ½ in. thickness of metal, with proper caps and base-plates. They should be connected together at the top by a timber beam not less than 8 by 8, or two 9 by 3 bolted together, or by a 5 by 4½ by 19lb. rolled steel joist. For the other part of the roof the straight side may match the part already described with the ridge continuous, the taper side being brought in by shortening the trusses on that side and letting the slates form a "flew" surface, i.e., with a gradually increasing pitch. Or, if the wall on the taper side may be carried up above the level of ridge, the trusses may be as sketched with a lead flat on the side with variable width.

HENRY ADAMS.

Rendering Sewage Land less Odorous.

GUILDFORD.—W. E. writes: "(1) I have a set of house drains with flushing tanks, all sewage going into a large cesspool, thence pumped into a tank, and gravitating over the land. The smell however is sometimes very bad. Is there any chemical I could use to diminish this? (2) I now use green copperas in the flushing tanks. Can you explain what effect this has, and if there is anything better?"

(1) The "Oxygen Sewage Purification Co's." system (address, 1, Suffolk Street, Dublin) might be advantageously adopted under such circum-

stances. In this system a proprietary preparation known as "Oxynite" is used for the chemical purification of the sewage. The "Reeves" system (Reeves Chemical Sanitation, Ltd., 17, Victoria Street, Westminster, S.W.) is another well-known method of sewage deodorization and purification by chemical means. The agents employed are "Reevozone" and sulphuric acid. (2) Green copperas (protosulphate of iron, $\text{FeSO}_4 + 7\text{H}_2\text{O}$), like sulphate of copper ($\text{CuSO}_4 + 5\text{H}_2\text{O}$), permanganate of potassium (KMnO_4) and other substances of a similar nature, which contain a considerable amount of oxygen, are largely used for the deodorization of sewage, owing to the fact that they readily give up their oxygen in the presence of organic matter. There are several deodorants much more powerful than green copperas—such as potassium permanganate with sulphuric acid—but some of the best known are proprietary articles specially prepared for sewage purification. The degree of deodorization effected by chemical means generally resolves itself into a question of expense. A considerable amount of valuable information respecting the chemical purification of sewage will be found in "Specification" No. 5, published at these offices, price 5s. nett. T. E. C.

Work of Assistant Town Surveyor.

ENQUIRER writes: "Kindly give me an idea of what would be the work of an assistant to a

town surveyor, both in the office and outside. What book would you recommend for study by one who is thinking of securing such a post?"

Get "How to become a Municipal Engineer," by J. Freebairn Stow, published by the St. Bride's Press, Ltd., 24, Bride Lane, Fleet Street, E.C., price 1s. A good handbook to study is Boulnois's "Municipal and Sanitary Engineer's Handbook" (E. & F. N. Spon, Ltd., 15s.), and "Specification No. 5" is an excellent reference book.

Books on Stresses, Strains, and Strength of Materials.

SCARBOROUGH.—ENQUIRER writes: "What books on stresses, strains and strength of materials do you recommend for the R.I.B.A. Intermediate Examination?"

Sir J. Anderson's "Strength of Materials" (3s. 6d.), Unwin's "Testing of Materials of Construction" (Longmans, Green & Co.).

South African Appointments.

CARDIFF.—BRITISHER writes: "I propose going to South Africa, either to Natal or Cape Colony. Are there any Government positions being given out to building foremen or inspectors?"

The railways are the only Government work on which, so far as we know, a building foreman might find employment in Cape Colony. In Natal employment under Government is obtained in the same way as here, but there is a plentiful supply of labour. See p. 391 of our issue for January 15th last.

FIG. 1

FIG. 2.

FIG. 3.

CONSTRUCTING STEEL CHIMNEY.

Stability of Steel Chimney.

BRISTOL.—E. E. M. writes: "I have to design a steel chimney stack 90ft. high and of about 4ft. internal diameter at the top and 7ft. at the bottom. How can I ascertain the strength and stability of such a structure?"

The main principles to keep in view are the following:—The maximum wind-pressure may be taken at $\frac{1}{2}$ cwt. per sq. ft. super. The effect of the wind on a circular chimney as compared with a square chimney or a plane surface is .7854 to 1. The internal diameter of a chimney shaft should be uniform; this can best be secured by a lining which has only its own weight to carry. Mild steel weighs 490lbs. per cu. ft. A height of 90ft. with uniform thickness and diameter would bring a pressure of $490 \times 90 = 306$ lbs. per sq. in. on the bottom, add

144
10 per cent. for rivets and laps = 337 lbs. per sq. in. for any thickness, but mild steel can safely be loaded to $6 \times 2210 = 13,440$ lbs. per sq. in., so that while $\frac{1}{2}$ in. is the thinnest practical lining it leaves a large margin for corrosion. The formula for contents of the frustum of a cone is $\frac{1}{3} \pi h (D^2 + d^2 + Dd)$. The outer shell may be perhaps $\frac{1}{2}$ in. thick at the bottom and $\frac{3}{8}$ in. at the top. With a bottom diameter of 7ft. inside and a top diameter of 4ft. inside, the weight of material would be $\frac{1}{3} \pi \times 90 (7^2 + 4^2 + 7 \times 4) = 2256.2 - 2191.26 = \text{say } 65$. $65 \times 490 = 31,850$ lbs. Add 5 per cent. for rivet heads = 33,442.5 lbs., and 2 cwt. for cap = say 33,670 lbs. This will give a pressure per sq. ft. at bottom of $\frac{33,670}{33.67} = \text{say } 30,404$ lbs. or $\frac{30,404}{2240} = 13,573$ tons. Now we must find the extra load brought on by the wind. The formula for a combined vertical and lateral force is $P = p + M \frac{I}{y}$, where—

P = maximum pressure tons per sq. ft. for both loads.
 p = average pressure tons per sq. ft. for vertical load only.
 M = bending moment in ft.-tons due to wind pressure.
 I = moment of inertia of section in ft.
 y = distance in ft. from neutral axis to furthest edge of section.

From above $p = 13,573$ tons per sq. ft. The bending moment will be $M = wL$. $w = \frac{4.06 + 7.1}{2} \times 90 \times .7854 \times \frac{1}{20} = 9.86$, say 10 tons, which will be applied at the centre of gravity of the diametrical plane, say 4ft. up = L . Then $M = wL = 10 \times 41 = 410$ ft.-tons. The moment of inertia of an annular section = $\frac{\pi}{64} (D^4 - d^4) = \frac{3.1416}{64} (7^4 - 4^4) = 6.872$, and $y = 3.55$. So that $p + M \frac{I}{y} = 13,573 + 410 \frac{6.872}{3.55} = 793$ tons per sq. ft., or $\frac{793}{144} = \text{say } 5.5$ tons per sq. in.

which fortunately will be just about the right load to allow a margin for corrosion. The accompanying sketches show alternative methods for dealing with the lining. Fig. 1 shows $\frac{1}{2}$ in. inner cylinder from top to bottom. Fig. 2 shows $\frac{1}{2}$ in. cylinder 9in. larger lined with firebrick half-

way up and a taper length above to reduce to normal size. Fig. 3 shows $\frac{1}{2}$ in. cylinder standing on a firebrick wall 9in. thick at the bottom for 20ft. up reduced by a set-off on the outside to $\frac{1}{2}$ in. thick for the upper part. Unless a steel chimney is in a very sheltered position it should have at least three guys to hold it in case of unnoticed corrosion at base, and these should make an angle of not more than 60 degs. with the horizontal.

HENRY ADAMS.

Books on Specifications, Quantities and Surveying.

FAVERSHAM.—G. I. J. writes: "Please name a good book on specifications, quantities and estimates, and surveying and levelling."

Specification: No. 5" (published from these offices, price 5s. nett), "Quantities and Quantity Taking," by W. E. Davis (D. Fourdrinier, Catherine Street, Covent Garden, W.C.; price 3s. 6d.), "Estimating," by George Stephenson (B. T. Batsford, price 6s. 6d.), "Practical Surveying," by G. W. Usill (Crosby Lockwood & Son, price 7s. 6d.).

Requirements of S. K. Building Construction Examination.

NORTH SHIELDS.—RHADAMANTHUS writes: "What are the requirements of the South Kensington Advanced Building Construction examination?"

See p. 93 of our issue for September 18th last.

Ascertaining Cost of Building.

ILKLEY.—R. F. writes: "Kindly answer the following question set at the R.I.B.A. Final Examination:—Three methods for arriving at the approximate cost of a building with the cost per cu. ft. for ordinary brickwork, stone, dressed stone, &c."

See an article on "The Cost of Buildings" on p. 408 of our issue for August 22nd, 1900.

Tile Manufacturers.

BRISTOL.—M. writes: "What is the address of J. & J. Wade, enamelled tile manufacturers?" We do not know.

Books on Building Construction.

LONDON.—H. T. S. writes: "Kindly recommend a book on Building Construction suitable for a pupil. I do not want an advanced or expensive work."

Read our articles on Building Construction. The best book on the subject is Rivington's, and if you intend seriously to study building construction you must get it. You need not obtain all the volumes at once, but get the next after you have read through each. There are four volumes: Vols. I. and II. 10s. 6d. each, Vol. III. 21s., Vol. IV. 15s. They are published by Longmans, Green & Co. Allen's "Practical Building Construction" (Crosby Lockwood & Son, price 7s. 6d.) is a good book for a beginner.

Builder's Liability for Mistakes in Quantities.

IPSWICH.—W. H. D. writes: "Referring to the reply on p. 451 of your issue for February 12th, suppose the architect omitted a large quantity of, say, brickwork, which was shown on the plans. The loss would be the builder's, although he has no means of checking the quantities. We often estimate for work without ever seeing the plans, or, at most, we just see them for half an hour in the architect's office. If your answer is right we shall have to check every bill of quantities."

The bill of quantities forms no part of the contract, and it is generally understood that the builder uses it at his own risk. He most certainly should check the bill of quantities with the specifications and drawings unless he can trust to the quantity surveyor's competency.

New Patents.

These patents are open to opposition until March 29th.

1901.—Sewage Distributing Apparatus.—1,070, W. D. SCOTT-MONCRIEFF, 14, Victoria Street, Westminster, S.W. The apparatus consists of a revolving horizontal distributor divided into lengths having a separate adjustable supply, so as to suit the area over which the section discharges; moreover the distributing pipe is perforated and has a trough on its upper side, into which liquid can well up and overflow. The whole is carried on girders and revolves on a vertical axis working in a gland and stuffing-box through which the incoming sewage is delivered.

Water-Closets.—4,537. W. DUNBAR, Newton Chambers, Cannon Street, Birmingham, and J. K. and W. FORD, both of Osmaston, Derby. A valve closet and an auxiliary syphon flushing cistern are placed side by side, the latter being emptied immediately after the contents of the former have been discharged into the trap: both being operated by pulling the valve-closet handle. The advantages claimed are that the action is very free from noise and the flush from the cistern, being concentrated directly on the comparatively small water-surface of the trap, effectually clears the latter and washes the drain.

Ventilators for Sewers.—4,742. T. E. BLADON, 99, Northwood Street, Birmingham. The ventilator consists of a many-sided body fitted with specially-hung mica or aluminium flaps and set on the top of a shaft: the object being to allow wind to enter whatever its direction may be.

Pug-Mills.—5,758. A. DISS, 21, Stanwell Street, Colchester. To the outlet of the pug-mill is attached a cast-iron grid having wedge-shaped bars presenting their sharp edges inwards. This grid prevents the clay leaving the mill too quickly and ensures thorough amalgamation; also preventing the exit of stones or lumps.

Roofing Materials.—24,139. J. SCHECK, Villa Stella, Kilchberg, near Zürich, Switzerland. The material consists of asphalt, cement, tarred paper, &c., made into sheet form with an inner layer of wire-cloth or perforated sheet metal.

The following specifications were published on Thursday last, and are open to opposition until April 5th. The names in italics are those of the communicators of the inventions. A summary of the more important of them will be given next week.

1901.—1,976, FRANKLIN, figured, rolled and other glass. 2,203, CHALLENGER, window-blind brackets. 2,557, ISAAC, apparatus for automatically ringing any number of electric bells. 3,123, SEGUY, insulating conduit for electric tramways. 4,959, MATHIESON, DENDY & MATHIESON, flue-pipe hood for ranges. 5,045, BOUQUET, pipes of strengthened cement, concrete, &c. 5,759, DISS, device for laying damp-courses. 5,760, DISS, metal dowel or tenon. 6,325, SHUMAN & SHUMAN, machines for moulding glass, &c. 6,384, LOGAN, street or road water-carts. 6,587, ECKSTEIN & COATES, water-tight electric bells. 6,836, HOWELL, forming screw-tapped lugs on letter-box plates, door knockers, &c. 7,108, J. & M. CRAIG, LTD., and HIGHT, after-service devices for syphonic water-closets. 16,665, ORR & MCCULLOCH, updraught ventilating cowls. 20,364, PELSENSTEIN, plural fuse-cut-outs for electric circuits. 21,546, MILLS (International Chemical Co.), composition for use as painters' filling. 22,782, JONES & JONES, locks. 23,438, BRENNER, door jams, gate posts, &c. 23,443, VON FORELL, manufacture of cement. 24,285, STEWART, expansion sockets for soil, waste, ventilating and other lead pipes. 24,423, WAINWRIGHT (Reno Inclined Elevator Co.), inclined elevators. 26,339, ROOPER, artificial grindstones. 26,524, THOMPSON (Davis), laying of underground electric conductors.

Keystones.

Richmond Hill View.—The Court of Common Council have refused to make a grant towards the preservation of this view.

"A Fireproof Railway Station."—The whole of the glasswork and roofing of this station, which was described on p. 7 of last week's issue, was executed by Messrs. Mellows & Co., Eclipse Works, Sheffield.

A New Wholesale Market at Leicester has been erected by the Corporation at a cost of more than £60,000. The building was designed by Mr. Brand in the Elizabethan style. The front is mostly faced with terra-cotta.

The Design for Hull's City Hall.—At a meeting of the Coltman and Albert Wards Ratepayers' Association held last week at Hull a resolution was passed approving the architect's design for the new city hall and shops, with the exception of the windows at the east end, and urging the Council to proceed with the work as soon as possible.

Glasgow and the Housing Problem.—The Glasgow Corporation agreed last week to seek Parliamentary powers to borrow three-quarters of a million sterling in order to acquire fifty acres within the City boundary upon which to erect dwellings for the poorer classes. It is proposed to build 400 tenements three storeys high, each tenement to have nine houses, thus giving in all 3,600 houses.

Westwood Edge Mission Church, Huddersfield.—A new chancel and Dorcas-room has been built in the Gothic style at a cost of about £840. The chancel has been furnished with oak furniture, and there are two leaded lights. The following were the contractors:—Messrs. Hirst, Frith & Co., masons, Golcar; John Varley & Sons, joiners, Slaithwaite; Frank Goodall, plumber and glazier, Slaithwaite; James Walker, plasterer and painter, Slaithwaite; and Thomas Allison, slater, Milnsbridge.

St. Matthew's Church, Grange-town, has just been completed. It is built entirely of brick, with the exception of the pillars and the arches in the arcades and the panel over the principal entrance, which are of stone. It is designed in the Early English style, with lancet windows and pointed arches. The cost of the building when completed will be about £5,000. Mr. G. M. Radge, of Normanby, is the builder, and Messrs. Hicks & Charlewood, of Newcastle, are the architects.

The Old Parish Church of Lydiard Tregoze, so intimately associated with the Bolingbroke family, has recently been restored and renovated, it is gratifying to learn, in a thoroughly conservative spirit. The main building dates from the early part of the fifteenth century, but there are traces of Norman work, especially a fine arch at the north door. In removing much modern plaster and whitewash a number of interesting frescoes were discovered, some being remarkably well preserved. Over the chancel arch is a picture of the Crucifixion with many figures, and on one of the nave pillars a painting of Christ after the Resurrection. Elsewhere are representations of St. Michael and the Dragon and a Norman castle. The removal of the plaster from the roof disclosed the fine old oak timbers in good preservation. At the northern entrance are carved figures representing Christ crowned with thorns and the Blessed Virgin.

A Batley Sunday School.—The Hanover Street Congregational Sunday School, Batley, is to be extended in the direction of the market estate, and more largely towards Hanover Street, where an imposing entrance will be erected in the Gothic style, in keeping with the other appointments. This enlargement will find additional accommodation for 150 more scholars in the assembly-room. Besides, the scheme includes two entrance-halls, a lecture-hall, young ladies' classroom, young men's classroom, library and other rooms. Messrs. C. H. Morriott, Son & Shaw, architects, of Dewsbury, have prepared the plans. The contractors are:—Mason, Mr. Joseph Oldroyd, Batley; joiner, Mr. W. H. Clegg, Dewsbury; slater, Mr. W. H. Thompson, Batley; plumber, Mr. James Walshaw, Batley; plasterer, Mr. Samuel Crawshaw, Batley; and ironwork, Messrs. James Bagshaw & Sons, Batley. The estimated cost is £2,842.

New Club Premises at Hull have been erected for the Hull and East Riding Club from plans by Mr. B. S. Jacobs at a cost of about £10,000.

Newmarket Architect's Affairs.—At the Cambridge Bankruptcy Court last week H. W. Roberts, of Kingston House, Newmarket, architect, came up for his public examination. The statement of accounts showed a deficiency of £1,307 19s. 3d.

A Reunion of London Scottish Architectural Assistants.—The Scottish architectural assistants resident in London held a dinner on Friday evening at the "Florence," Mr. James S. Gibson, F.R.I.B.A., occupying the chair. The company numbered about fifty. After the dinner a very successful smoking concert was held.

New Bank at Chelmsford.—Plans for the new building of the Capital and Counties Bank, Ltd., in the High Street, Chelmsford, have just been completed by Messrs. Clare & Ross. Five storeys high, the lower storey will be of finely-dressed grey granite, with a polished Hoptonwood stone plinth, while the upper storeys will be of red brick with Ancaster stone dressings.

Board School Buildings at Birkenhead.—At the last meeting of the Birkenhead School Board the plans of Mr. Thomas W. Cubbon, architect, of Birkenhead, were adopted for a block of educational buildings, including a pupil teachers' college and two higher elementary schools for 300 boys and 300 girls respectively. The pupil teachers' college has accommodation for 150 students. The whole block of buildings is expected to cost about £30,000.

Mr. Charles Henry Hargreaves, architect, of Bradford, died recently in the sixtieth year of his age. Mr. Hargreaves, was articled with the late Mr. Eli Milnes, and started in practice for himself as an architect thirty-four years ago. He made a special study of the designing of elementary schools, and for twenty-six years he was with Mr. E. P. Peterson, F.S.A., joint architect to the Bradford School Board. For a period he was in partnership with Mr. Wilson Bailey, of Bradford and Keighley.

New Baptist Schools at East Finchley N., are being erected at a cost of about £3,700 from designs by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, architects, 5 Clement's Inn, Strand, London. The school hall will be of two storeys, with classrooms under the side end galleries, divided by swivel panelled partitions, and a spacious platform. Three large classrooms are arranged in the rear at one end of the hall. The buildings are to be faced with split flints and Bath-stone dressings. A spacious church for 760 sittings with a bold tower is part of the scheme, but will not be erected for the present.

Edinburgh Architectural Association.—At last week's meeting of this Association (Mr. H. F. Kerr, president, in the chair) a lecture was delivered by Mr. W. G. Burn-Murdoch on Scottish history from early times to the Union of Scotland and England. Limelight views were shown of the historical design proposed for the new municipal buildings in Edinburgh. Previous to the lecture, on the motion of the chairman it was remitted to the committee of management to consider and report as to the desirableness of affiliation with the Royal Institute of British Architects. Mr. James Bruce, W.S., gave notice of the following motion: "That the Association should approach the Carnegie Trust with a view to establishing a Chair of Architecture in the University of Edinburgh."

Iona Cathedral is to be restored. The choir, the aisles and the south transept are to be roofed in. Possibly the finishing of the top of the tower and roofing it according to its original height may be included in the work, but this is not quite decided on. The roof will be in strict accordance with the original roof; the gables of the building are still standing, and the raggle of the tower will clearly indicate the form and height of the original wall. All the indications of this kind presented by the building will be rigorously adhered to. The windows are to be glazed, and the portion taken in hand will be rendered perfectly water-tight. The remaining part of the restoration will go on as funds permit. The architects are Messrs. McGibbon & Ross, Edinburgh; and Messrs. Mitchell & Sons, Edinburgh, are the contractors.

Science, not Sentiment, says Mr. Balfour, is required for the solution of the housing problem.

For Striking Matches on a Building, and so defacing it, a man was fined 10s. at Evesham recently.

The Distillery in Cowcross Street, E.C., illustrated on p. 2 of our last issue, was designed by Mr. E. W. Mountford, F.R.I.B.A., not by Mr. Colcutt.

"The Art Record."—The February issue of this publication, which is now a monthly, contains reproductions of numerous studies by Mr. Herbert J. Draper, whose work attracts so much attention at the Academy exhibitions.

The Glasgow Technical College Architectural Craftsmen's Society held a meeting last Friday, when Mr. Thomas S. Fraser, architect, read a paper on "The Renaissance Architecture of Scotland."

A Dartmouth Competition.—Mr. A. S. Parker, of Plymouth, has won the first premium in the competition for offices and a dwelling-house for the Channel Coaling Co., at Dartmouth. Mr. J. J. Smith, of Bidford, and Mr. P. Kerley, of Exeter, were awarded the second and third premiums respectively.

Partnership.—Mr. J. F. Fogerty, B.E., A.R.I.B.A., and W. Clifford Parnell, architects, civil engineers and surveyors, have entered into partnership, thus combining the businesses of the late firms of Pinder & Fogerty (formerly Kemp Welch & Pinder) and Pearce & Parnell (formerly Pearce & Offer). Their address is Belfast House, Gervis Place, Bournemouth.

A New Police Station and Library at Chapeltown is to be erected for the Leeds City Council from designs by Mr. William H. Thorp, architect, of 61, Albion Street, Leeds, at the junction of Chapeltown Road and Town Street. The Elizabethan style of architecture has been adopted. It is estimated that the total expenditure upon the building will be a little over £8,000. A fire-brigade station is included in the design.

A Birmingham Architect's Bankruptcy.—The first meeting of creditors of Herbert J. Greatrex, architect, 121, Colmore Row, Birmingham, was held last week. The debtor's statement of affairs showed unsecured liabilities £806 7s. 10d. and assets estimated to produce £339 5s. 6d. Failure is attributed to "law charges, borrowing money at a heavy rate of interest, and illness."

Prizes for Good Street Architecture.—Following the example of Brussels, the Paris Municipality resolved a couple of years ago to give prizes every year for the six handsomest new houses. The prizes were to consist of gold medals to the architects, bronze medals to the builders, while the landlords were to be exempted from half the taxes falling upon a new building. A jury of architects has published its list of awards, and appends a critical notice of the six prize buildings.

The South Wales and Monmouthshire Architects' Society held its annual meeting recently at the Art Galleries, Queen Street, Cardiff. Mr. E. W. M. Corbett, J.P., presiding. The following officers were elected for the ensuing year: President, Mr. H. Snell; hon. secretary, Mr. C. L. Wilson; hon. treasurer, Mr. E. H. Faulkner; hon. librarian, Mr. H. C. Rimell; hon. auditor, Mr. E. H. Bruton; council, Messrs. H. Snell, E. W. M. Corbett, George Thomas, J. C. Carter, E. B. Dowler, E. H. Bruton, E. M. Bruce-Vaughan, E. H. Faulkner, W. H. D. Caple, E. H. Down, and C. L. Wilson.

Mr. Norman Shaw's Studios.—The late Mr. Sidney Cooper's London house and studio are to be sold by auction next month. The studio of the Chepstow Villas house was designed by Mr. Norman Shaw, R.A., who has been responsible for the plans of a great number of the houses and work-rooms of his painter-brethren. Mr. Norman Shaw designed two of the finest of the Melbury Road houses, those of Mr. Luke Fildes and Mr. Marcus Stone, and the quaint and charming house that Mr. Boughton built for himself on the summit of Campden Hill twenty-three years ago. Among the Hampstead artist houses designed by Mr. Norman Shaw those built for the late Frank Holl and for Kate Greenaway are pre-eminent. It was Mr. Shaw, too, who designed the fine painting-room that Mr. B. W. Leader built at Gomshall.

Trade and Craft.

Church Fittings.

Messrs. G. Porter & Co., church furnishers, send us a copy of their illustrated catalogue of the various fittings or furniture for churches. A large variety of pulpits, altars, fonts, reredoses and choir stalls (in oak, pitch-pine, Caen stone and marble) are shown, and chancel and parclose screens, lecterns, church seats, &c., are dealt with in an equally comprehensive manner: so that all needs, from plain pitch-pine work to elaborately-carved furniture, are satisfied. In addition, Messrs. Porter also supply brass altar crosses, candlesticks, thuribles, vases and other accessories of religious worship, besides church decorations of every kind. The firm also undertakes monumental sculpture and are willing to forward special designs for tombs, crosses, &c., on application. Their showrooms are at 260, Fulham Road, West Brompton, and their works at 402-4, King's Road, Chelsea, London, S.W.

Grundy's Patent Closet.

The efficiency of closets is only second in importance to the purity of our water-supply, and it is satisfactory to know that they are being increasingly made more sanitary. The type to which we now wish to draw attention—"The Only"—is supplied by Grundy's Sanitary Appliances Syndicate, of 13, King William Street, London, E.C. In designing this closet the special features kept in view were efficiency, durability, silence and simplicity. Ball, ball-tap, chains, syphon and other accessories are all dispensed with, and instead a two-way valve is employed which is operated by the seat or a foot-lever at one side. When pressure is applied to either of these the valve spindle is raised and allows the cistern to fill, the discharge of the water being effected when the pressure on the seat or the foot-lever is relieved. The only water-pressure required is the head sufficient to fill the tank to provide a flush equal to the present open-tank system. No sound of running water can be heard when the tank is filling and, further, in the supply pipe in front of the inlet valve is placed a check valve, which is always closed except when the tank is filling, thus preventing the supply being contaminated with foul gas or other impurity: while to prevent the tank emptying sluggishly a balance valve is fixed at the top to accelerate the flush. Another speciality of Grundy's Sanitary Appliances Syndicate is a non-ball-valve storage cistern for water. Its main features are that water cannot be wasted from the overflow (this being prevented by a float) and cannot re-enter the main (this being effected by the non-return valve). The cistern is filled from the top and emptied from the bottom, all offensive house smells and dust are guarded against, while pure air from outside is admitted as required. The cisterns are made to withstand any pressure from 10lbs. to 200lbs. per sq. in. and of 20 gals. to 200 gals. capacity. It may be added that this system of storage has already been approved by several water companies.

New Companies.

R. Canty & Sons, Ltd.

Registered to carry on business as wholesale and retail timber merchants, sawmillers, wood-turners, japanners and builders' merchants. Capital £6,000 in £1 shares. The directors are R. Canty, sen., R. Canty, jun., A. Canty and E. W. Nelson. Registered office: Dawson Lane, Kingston-on-Hull.

Adderley Park Brick Co., Ltd.

Registered to acquire the business now and hitherto carried on under the style of the Adderley Park Brick Company (in liquidation) with the factories and other property connected therewith, and to carry on business as manufacturers of and dealers in bricks, tiles, drain-pipes and other articles of clay; as builders and contractors, merchants and dealers in stone, sand, lime, bricks, timber and hardware. Capital £12,000 in £5 shares. The first directors are James Moffat, T. Hunt, T. Surman and J. J. Moffat.

COMING EVENTS.

Wednesday, February 26.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. G. Burn-Murdoch on "Historical Design proposed for the New Municipal Buildings," 8 p.m.
SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I).—Mr. A. Wellesley Harris, M.B.O.S., on "Infectious Diseases," 7 p.m. Inspection and Demonstration at Soap Works.
NORTHERN ARCHITECTURAL ASSOCIATION.—Council Meeting at 6.45 p.m. Mr. Algernon P. B. Barker, B.A., on "Duties of Building Owners as to Sewers," 7.30 p.m.
DEVON AND EXETER ARCHITECTURAL SOCIETY (Plymouth, Devonport and Stonehouse Branch).—Address by Mr. Silvanus Trevall, F.R.I.B.A., P.S.A.
GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

Thursday, February 27.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.
LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Paper by Mr. William Burton, F.C.S., 6.30 p.m.
ROYAL ACADEMY.—Mr. Alfred Gilbert, R.A., on "Sculpture"—IV., 4 p.m.
CARPENTERS' COMPANY, Carpenters' Hall, E.C.—Mr. H. Heathcote Statham, F.R.I.B.A., on "The Architectural Treatment of Bridges," 8 p.m.

Friday, February 28.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. T. H. Russell, M.A., on "Dartmoor Granite," 7.30 p.m.
DEVON AND EXETER ARCHITECTURAL SOCIETY.—Mr. A. S. Parker, A.R.I.B.A., on "Building By-laws."
PHYSICAL SOCIETY.—Meeting at 5 p.m.
SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I).—Mr. A. Wellesley Harris, M.B.O.S., on "Methods of Disinfection," 7 p.m.
INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. A. M. Arter on "Indicating High-Speed Steam Engines," 8 p.m.

Saturday, March 1.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Meeting at 6 p.m.
SANITARY INSPECTORS' ASSOCIATION.—Meeting at 6 p.m.
ROYAL INSTITUTION.—Lord Rayleigh on "Some Electrical Developments"—II., 3 p.m.
SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Inspection and Demonstration at Marylebone Stoneyard, Richmond Street, Edgware Road, W., at 3 p.m.

Monday, March 3.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Special General Meeting to elect Royal Gold Medalist. Ordinary General Meeting following. Sir W. B. Richmond, K.O.B., R.A., to move: "That in view of a resolution of the Coal Smoke Abatement Society seeking the co-operation of the Institute, members are invited to join the Society, or that such assistance be given by the Institute as the Council may deem desirable." Exhibition of about a hundred photographs of architectural work, forming part of the collections of the National Photographic Record Society prior to the collections being deposited in the British Museum.
ROYAL ACADEMY.—Mr. Alfred Gilbert, R.A., on "Sculpture"—V., 4 p.m.
BIRMINGHAM AND DISTRICT CLERKS OF WORKS' AND BUILDERS' FOREMEN'S ASSOCIATION.—Mr. Joseph H. Pickard on "The Highways and Byways of Warwickshire," 8 p.m.
ROYAL PHILOSOPHICAL SOCIETY OF GLASGOW: ARCHITECTURAL SECTION.—Mr. Joseph Sommerville on "The Habitat and Mode of Growth of the Dry Rot Fungus."

LIVERPOOL ARCHITECTURAL SOCIETY.—Paper by Mr. Edgar Wood, A.R.I.B.A.
VICTORIA INSTITUTE.—Mr. J. Malcolm Mac'aren on "The Physical History of the New Zealand Fjords," 4.30 p.m.
SOCIETY OF ENGINEERS.—Mr. Benjamin H. Thwaite, A.M.I.C.E., on "British versus American Patent Law Practice and Engineering Invention," 7.30 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Demonstration of Book-keeping as carried out in a Sanitary Inspector's Office, in the Parkes Museum at 7 p.m.; by Mr. Albert Taylor.

Tuesday, March 4.

ROYAL INSTITUTION.—Mr. W. N. Shaw on "The Temperature of the Atmosphere"—II., 3 p.m.
ARCHITECTURAL ASSOCIATION OF IRELAND.—Mr. F. G. Hicks on "Colour in Architecture," 7.45 p.m.
SOCIETY OF ARTS (Applied Art Section).—Mr. Gerald C. Horsley on "Structural Colour Decoration of the Interior of Public Buildings," 8 p.m.
SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. Henry R. Kenwood, M.B., on "Water: Composition, Pollution and Purification," 7 p.m.

Wednesday, March 5.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Evening.
EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Meeting).—Mr. George Wittet on "A Visit to Oxford," 8 p.m.
THE CHEMICAL SOCIETY.—Meeting at 5.30 p.m.
BRITISH ARCHAEOLOGICAL ASSOCIATION.—Meeting at 8 p.m.
SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Inspection and demonstration at L.C.C. Common Lodging House, Parker Street, Drury Lane, W.C., at 3 p.m.

THE SMALL-POX OUTBREAK

should be sufficient to determine all readers around London to adopt No. 3 of

Our Insurance Schemes

while the advantages obtainable by the other two Schemes are obvious, so much so that applications are being constantly received from all parts of the country.

These are the three Schemes:—

- (1) *A Free Accident Insurance of £500 to every regular reader of our paper.*
- (2) *An Accident Insurance of £500, and also £250 for Permanent Total Disablement. £2 10s. per week for Temporary Total Disablement. Premium, 1/-*

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

- (3) *An Accident Insurance of £1,000, with the following special additional advantages: £500 for Permanent Total Disablement. £6 per week for Temporary Total Disablement. £1 10s. per week for Temporary Partial Disablement. £30 Annuity. £3 per week during confinement from such illnesses as Small Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c. Ordinary Risks, Premium, £3/- Hazardous Risks, Premium, £3/10/-*

Write for Proposal Form.

These Insurances are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

SPECIAL NOTICE.

- (1) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.
- (2) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.
- (3) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.
- (4) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.
- (5) In applying it is only necessary to write a postcard, giving the full name and address of the newsagent from whom the copy is obtained.

A Pamphlet, giving full details of the THREE SCHEMES will be sent on application to
THE MANAGER, BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BOX (WILTS).—For alterations to Sunnyside, for Mr. D. G. Bingham. Mr. Harold Brakspear, F.S.A., architect, 31, Chancery Lane, Messrs. Pinks & Watson, Parliament Mansions, Victoria Street, S.W.1.—
Light & Smith ... £2,000
R. E. D. Rudman ... 2,570
Hayward & Wooster ... 2,543
H. Hoskings, Hungerford ... 2,490
* Accepted.

BRADFORD (WILTS).—For the erection of new stable buildings at the Hall, for Mr. J. Moulton. Mr. Harold Brakspear, F.S.A., architect, Corsham. Quantities by Messrs. Pinks & Watson, Parliament Mansions, Victoria Street, S.W.1.—
R. E. D. Rudman ... £2,127
E. Chancellor ... 2,120
Hayward & Wooster, Bath ... 2,080
* Accepted.

DEVIZES.—For alterations to Brownston House, for the Misses Milnes. Mr. Harold Brakspear, F.S.A., architect, Corsham. Quantities by Messrs. Pinks & Watson, Parliament Mansions, Victoria Street, S.W.1.—
Hayward & Wooster ... £2,636
Light & Smith ... 2,318
H. Hoskings ... 2,150
R. Rudman, Chippenham ... 2,187
* Accepted.

DYSART.—Accepted for the formation of a sewer on Dysart Road, for Dysart Town Council. Mr. D. Forbes Smith, A.R.I.B.A., surveyor, 210 High Street, Kirkcaldy.—
Alexander Fraser, Junr., Perth ... £240 6 10

GWYRFAL (WALES).—For the construction of tanks, flushing chambers, and for providing and laying about 3,340 lineal yards of 4-in. and 21 lineal yards of 3-in. cast-iron main and other works, for the Gwyrfal Rural District Council. Mr. E. Evans, A.M.I.C.E., engineer, & Castle Street, Carnarvon.—
D. Owen, Glyn Garth Post Office, Menai ... £3,671 14 6
W. Thomas, Tregeath, Bangor ... 2,935 0 0
E. Jones, Plas Dowllydd, Llanwnda ... 2,550 0 0
R. Jones, Twrog Mills, Llanwnda ... 2,564 3 5
E. A. Chase, Moultpier, Bristol ... 2,496 12 3
M. A. Crowe, Deansgate, Manchester ... 2,289 16 4

GELLIGAER (WALES).—For the following works: (Contract No. 1.) Bargoed and Giffach sewerage—the laying of 8½ miles of 12-in. sewers 12 in. to 6 in. in diameter, together with manholes, ventilators, bacteria beds, screening chamber, detritus tank, storm-water filter, flushing tank, &c.; (2.) Fochriw sewerage—the laying of 1,340 yards of pipe sewers 9-in. and 9-in. diameter, together with manholes, ventilators, bacteria beds, screening chamber, &c., for the Gelligiger and Rhigos Rural District Council. Mr. Jas. P. Jones, engineer.—

Bargoed and Giffach sewerage.
W. Williams, Ystrad Rhondda ... £10,531 19 8
J. Sutherland, Clifton Villa, Abercynon ... 10,316 12 2
D. Jones, Dowlais ... 9,760 10 9
W. Williams & Sons, New Tredegar ... 9,198 8 10
G. Rutter, Romilly Chambers, Barry ... 8,963 6 1
J. E. Evans, Taverne, Cardiff ... 8,583 12 5

Fochriw sewerage.
G. Rutter ... £1,172 13 0
Lawson & Co., Newport ... 1,143 14 10
J. E. Evans ... 1,105 16 8
D. Jones, Brithdir ... 1,069 0 0
D. Jones ... 958 7 0
W. Williams & Sons ... 931 14 8
J. Jones, Graigfaerod, Beddington ... 901 4 11
F. Davies & Co., High Street, Bargoed ... 861 1 6
* Accepted.

HATFIELD.—For the erection of new infirmary for women at the workhouse, for the Guardians. Messrs. Chas. Smith & Son, architects, Reading.—

Stephens, Bastow & Co., Ltd. ... £2,801 0 0
Perry Bros. ... 2,650 0 0
C. Jackson ... 2,620 1 6
J. Appleby ... 2,584 0 0
General Builders, Ltd. ... 2,513 4 3
Coulson and Lotts ... 2,415 0 0
S. Redhouse, sen. ... 2,377 4 9
W. M. Ruther ... 2,372 16 4
W. Howard ... 2,345 15 0
Miskin & Sons ... 2,343 0 0
W. French ... 2,313 4 3
Dupont & Co. ... 2,275 0 0
Wilmott & Sons ... 2,255 0 0
Hardy Bros. ... 2,252 0 0
Viney & Stone ... 2,214 0 0
F. G. Minter ... 2,207 0 0
Maple & Co. ... 2,187 0 0
Norris & Son ... 2,180 0 0
Mussellwhite & Son ... 2,177 0 0
G. Jackson ... 2,167 0 0
T. H. Coleman ... 2,135 0 0
W. Wade ... 2,130 0 0
Ekins & Co. ... 2,103 0 0
Wilkinson Bros. ... 2,066 0 0
W. G. Durham ... 2,060 10 0
S. Warboys, Potters Bar, Middlesex ... 2,060 0 0
* Accepted.

HAVERHILL (SUFFOLK).—For the erection of a house, offices, and stores in High Street, Haverhill, for Messrs. Green, King & Sons, Ltd., Bury St. Edmunds. Mr. A. Ainsworth Hunt, architect, Sudbury.—

Coulson & Lotts, Cambridge ... £2,083
Kerridge & Shaw, Cambridge ... 1,900
C. Runnacles, Halstead ... 1,897
Mason & Sons, Haverhill ... 1,783
* Accepted.

JARROW.—For excavating and making the following streets and roads: St. Paul's Road, Russell Street, Wilberforce Street, and Raglan Street, for the Urban Sanitary Authority. Mr. J. Petree, borough surveyor.—

Thornton ... £2,120 7 0
T. Callagher ... 1,961 1 3
Glen & Moffat ... 1,926 1 5
* Accepted. [Surveyor's estimate, £1,770 12 6.]

KIRKCALDY.—Accepted for the erection of houses in St. Clair Street, Kirkcaldy, for Messrs. Henry and Peter Kilgour. Mr. D. Forbes Smith, A.R.I.B.A., architect, 210 High Street, Kirkcaldy.—

Mason—Henry Masterton, Kirkcaldy ... £728 14 8
Joiners—Geo. Hay & Son, Dysart ... 492 12 0
Plasterers—J. Williamson & Son, Burntisland ... 144 11 6
Slaters— ... 69 5 0
Plumbers—Blyth & Doregal, Kirkcaldy ... 74 10 0
[Total £1,560 13s. 8d.]

LONDON, E.—For the erection of new offices and caretaker's lodge, 3 Mill Lane, Bromley-by-Bow, E., for Messrs. Kemball, Bishop & Co., Ltd. Messrs. Wigg, Oliver, Hudson & Co., architects, 80 Leman Street, E. Quantities by Messrs. Stranger & Son:—
G. E. Weston ... £2,472
J. & H. Cocks ... 2,462
Hawley & Newman ... 2,346
Hawley & Oldman ... 2,320
Cuthwaite & Co. ... 2,267
Sparks ... 2,250
Shurnur & Co. ... 1,965
Shorn & Sons ... 1,950

LONDON, W.—For the erection of villa residence in Hendon Avenue on the Great Park Estate, for Messrs. J. J. Bridgewater. Mr. Walter Bennett, architect, Church End, Finchley, N. Quantities by Mr. William Hawker, 73 Moorgate Street, E.C.4.—
Fremman & Barber ... £3,500
Jesse Phoenix ... 2,900
Gough & Co. ... 2,934
[Architect's Estimate £2,800.]

LONDON, N.—For new block of workmen's dwellings in Northwood Road, Stoke Newington. Mr. R. Langton Cole, architect:—
Dore Bros. ... £6,855
Woodward & Co. ... 6,840
Lawrance & Co. ... 6,005
Coils & Sons ... £6,647
Clarke & Bracey ... 6,305
* Accepted.

LONDON, N.W.—For retaining wall to house, Frogdon Lane, Hendon, and Messrs. Barrett & Driver, architects, 53 Blomfield Road, Maida Vale, W.1.—
John Russell, Hampstead ... £2,825
G. Neal, Kilburn ... 263
* Recommended for acceptance.

Royal Academy Exhibition, 1902.

The receiving day for architectural works is
Thursday, March 27th. We shall be pleased, as
in previous years, to receive drawings from
intending exhibitors and to forward them (free
of expense) to Burlington House. In order
that careful reproductions may be made for
publication, it is requested that drawings be sent
as early as possible. No drawings can be
received by us later than noon on the sending-in
day.

An Architectural Causerie.

The Late J. F. Bentley. WE little thought when we
published the portrait of Mr.
J. F. Bentley as the Royal

Gold Medallist for 1902 that in two weeks' time it would be our mournful duty to chronicle his death. Even as recently as Friday evening he was looking over his splendid cathedral at Westminster and seemed well and hearty then; yet the next evening he died of paralysis in a friend's house in London; and thus is added another name to that tragic list of architects whose fate it is to be swept away when in the midst of their life-work. Mr. Bentley had previously been seized with paralysis on two occasions, the more recent of which had seriously impaired his speech; and he seems to have been sadly conscious of the improbability of seeing his cathedral finished. One who knew him well describes as absolutely pathetic the way in which he would stand evening after evening, within the shadow of the great tower of the cathedral, gazing long and fixedly at its gradual advance towards completion, and then turning away with a sigh, which his friend interpreted as the expression of his doubt as to whether he would witness the carrying out of his designs in their entirety. The tragedy of Mr. Bentley's death is intensified by the fact that on Monday evening it was the object of the Royal Institute of British Architects to elect him as the recipient of the Royal Gold Medal "for his work as an architect"; but now he is beyond such honour: his architecture, however, remains, and will always be looked upon as the effort of a great mind inspired with noble ideas, culminating in the most original of modern cathedrals. We hope next week to publish an appreciation of the late Mr. Bentley, with some illustrations of his work.

Building Patents MR. GERALD BALFOUR'S new
Bill for amending the Patent
and the New Bill. Law is noteworthy as marking

a radical change from the practice hitherto upheld in this country; that is to say, it countenances preliminary examination in a mild form, though, as yet, it does not approach the stringency or the effectiveness of the American and German systems. The fact that letters

patents are granted here for ideas that have already been patented makes the existing system ludicrous as well as injurious, for the general assumption is that the Patent Office seal affords an absolute protection, whereas some patents are not worth the paper on which they are printed. If the new Bill becomes law, on receiving an application the Patent Office officials will search the specifications of the previous fifty years, and if none of them anticipates the idea in question the inventor will receive his patent in the usual way, subject, however, to the payment of an additional £1, which thus increases the stamp duty to £5. If the idea has been anticipated the Comptroller will inform the applicant, who may, if he wish, amend his specification so that it satisfies the examiners; but even if he declines to do this he can still obtain his patent, though it will bear the information of having been anticipated. The objection is raised that such a course will not damage the

Upper Baker Street, for many years the home of the famous actress Mrs. Siddons, is about to disappear. Mrs. Siddons occupied the house from 1817, after her retirement from the stage, till her death in 1831. She added some rooms to the original building, using one of them as a studio in which she did her clay-modelling. Mrs. Siddons took to this pursuit with great ardour, and attempted one or two figures on a grand scale. Here, too, she used to give reading parties, which were attended by many famous personages who delighted to hear the Queen of Tragedy declaim passages from Shakespeare and the old dramatists. Washington Irving was amongst these visitors, and the famous American author has put on record his feelings of delight at hearing Mrs. Siddons recite the passages spoken by Constance in "King John." It seems a pity to pull the old house down, as it stands in a splendid position commanding a fine view of one of the entrances to Regent's Park,

NO. 27, UPPER BAKER STREET, LONDON, N.W.: MRS. SIDDONS'S HOUSE.
DRAWN BY H. J. PALMER.

bogus patentee and that consequently the Bill is futile; but it seems to us that the fact is not appreciated by thus making known the anticipation of an invention the Patent Office will be preventing a very great number of persons proceeding with ideas that are "obviously old" and worthless: and this view of the matter is particularly true when building patents are considered. Amateurs and faddists have always been very prone to invent something connected with building operations—house fittings, chimney tops, and other similarly hackneyed appliances—and consequently one finds scores of specifications which are nothing more than duplicates of others, with such slight differences, of course, as shall satisfy the official red-tapeism and peace of mind. Under the new Act, whatever its other shortcomings may be, almost all of these old patents will be prevented from reappearing in new disguise; so that the inventors themselves will be saved money and the manufacturers be rid of a great deal of bother.

Mrs. Siddons's
House.

ALL who take an interest in historic London houses will learn with regret that, in consequence of railway improvements, No. 27,

Sculpture for Blackfriars Bridge.

IN Blackfriars Bridge we have the unsuccessful attempt of an engineer to be architectural, the stumpy granite columns being specially unsatisfactory, as they are unconstructional, having no weight to support. At present, however, the Bridges Committee of the City Corporation have under consideration the scheme of embellishing the bridge with sculpture in commemoration of the Coronation, the suggestion being to place four equestrian statues of four Edwards on the pedestals at either end of the bridge. This scheme, however, is really a revival of that mooted twelve years ago, when a competition even was held, two prizes of £250 and £150, two of £150 and two of £100 being offered for the best models. Yet, after all this waste of time and energy, the scheme was abandoned in 1886. The present proposal is nothing like so extensive (the cost of the former one was £30,000), and though the bridge would certainly be improved by the addition of sculpture, we think a more satisfactory object might be selected for embellishment: for, however fine the sculpture, the bridge will mar its effect.

THE GREEK THEATRE, SYRACUSE.

SICILY AND ITS ARCHITECTURAL MONUMENTS.—IV.

By F. HAMILTON JACKSON, R.B.A.

(Continued from p. 448, No. 366.)

THE line to Syracuse on leaving Catania at first runs across the plain of Catania, still regarded as the granary of the island. Passing Valsavoia, the junction for Caltagirone, the lake of Lentini is approached, a lake which did not exist when Leontinoi was founded by colonists from Naxos in 729 B.C., as they say. Gorgias the orator, whose eloquence induced the Athenians to intervene in the quarrels of the Sicilians, was a native of this place, and near here Diodorus says that wheat grew wild in his day. Between Lentini and Syracuse the line approaches and follows the coast, discovering many delightful coves, where the barren-looking rocks are relieved by the deep blue of the sea upon which little fishing boats show their white sails like sea birds floating on the waves. Augusta, a city founded by Frederick the Second in 1232, and peopled with the inhabitants of Centuripe (which Cicero mentions as the richest town in Sicily) which was destroyed in 1233, occupies as some think the site of the ancient Xiphonia and makes a picturesque and splendid appearance with its castle on the hill and the houses grouped about its feet; backed up by the blue sea which almost surrounds the promontory. Around this Megarean bay ancient sites are pretty numerous. Here was Megara Hyblaea, celebrated for its honey, Alabon, and the peninsula of Thapsus, so well known in connection with the Athenian campaign against Syracuse. The railway still skirts the coast below the ancient walls of Achradina, and reaches the station, which lies beyond the ancient Agora, where one upright column and several lying on the ground, with four bases *in situ*, mark the spot.

At Syracuse the interest of the Greek period is so much greater than that of subsequent or previous times that many people practically ignore the latter altogether; which may give greater vividness and strength to the impressions of the one period, but causes one to lose a great deal of interest, since much lies outside of it. The principal antique remains are the following. In Ortygia, the modern city of Syracuse, the cathedral, in the walls of which are embedded the columns of a temple thought to be the celebrated temple of Minerva which Verres despoiled of so many of its beautiful works of art; the poor remains of a temple of very ancient date, thought to have been dedicated to Apollo from an inscription found on the site, but by some said to be that of Diana; the fountain of Arethusa and the antiquities collected in the museum, which include the celebrated statue of Venus; a large collection of objects found in the Megarean graves and a few early Christian objects. In Neapolis, the Greek theatre,

the Roman amphitheatre, the altar of the hecatombs and the Latomie or ancient quarries, and in Epipolæ the fortress of Euryelus. The early Christian and mediæval remains include the church of S. Giovanni, from which the crypt of San Marsciano and the catacombs are entered; the church of Santa Lucia; the Palazzo Montalto and other palaces, many of them now in a ruinous state. The Greek theatre was the largest structure of its kind after those of Miletus and Megalopolis, and is nearly 165yds. in diameter. Forty-six tiers of seats may still be traced, but there were probably fourteen or fifteen more. The nine "cunei" or sections were intersected by a broad and a narrow "præcinctio" or gangway following the same curve as the seats, and on the broad one are Greek inscriptions recording the names of King Hiero, the Queens Philistis and Nereis, and Zeus Olympius, after whom the different compartments were named. The eleven lower rows were covered with marble, and above the upper rock-cut ones may be seen the holes for the masts which sustained the velarium. This theatre was constructed in the fifth century B.C., and here Dionysius the First (406-367 B.C.) came to see his dramas produced, sitting in a place which is still pointed out as his chair. This was the man who so much extended the fortifications of the four cities, who was regarded as the most powerful prince of his time next to the King of Persia, and who died at the age of sixty-three from a surfeit, caused by feasting to celebrate his victory at Athens in a tragic contest. Above the theatre is the nymphæum, a grotto into which two water-conduits issue, and higher still is the Street of Tombs, now without any decoration and with empty tomb chambers. From this place the eye ranges over the fertile plain towards Ortygia, on one side of which is the smaller harbour, and on the other the greater, in which the great seafight took place in 413 B.C. between Athenian and Spartan under the eyes of the citizens of Syracuse, whose cries to the combatants are said by Thucydides to have been like the strophe and antistrophe of the theatre, and some of whom no doubt viewed the fight from this very place. Between the two harbours modern Syracuse glitters white against the blue African sea.

The Roman amphitheatre is a little to the east. It is not mentioned by Cicero, and Tacitus is the only Roman writer who refers to it, so it is probably of the time of Augustus; no architectural features of importance remain. Its length is 77yds. and its breadth 44yds. The steps were covered with marble and on the edge of the arena the names of the owners of the places were marked and still remain here and there. The great altar lies just below. Hiero the Second built one which was a stadium long (292yds.). This one is 215yds. long and 25yds. broad, and is probably the same, and it was upon it that the annual sacrifice of 450 oxen which commemorated the expulsion of the tyrant Thrasybulus was offered. It has a projecting cornice and base and looks like a long

podium. Under the church of S. Nicolò close by is a cistern sustained by fourteen thick piers. From the theatre it is a walk of from 1½ to 2 hours across the site of Neapolis and Epipolæ to Fort Euryelus, where the two walls of Dionysius met. Here there are five massive towers, flanked by two deep fosses cut in the rock, and from these fosses a number of subterranean outlets connected with each other and united by staircases, some of them magazines, some stables, &c., communicate with the great court behind the towers, while another leads to a fort on the wall further to the north. The rings cut in the stone for tethering horses are still visible in many places and the Greek numbers by which one part was distinguished from another. These subterranean chambers and passages received light either from great circular apertures in the roof or from openings cut in the rock almost on the level of the soil. The walls are formed of blocks about 4ft. 6in. long, 2ft. high and 2ft. 4in. thick, being themselves generally rather more than 10ft. thick, but increasing sometimes to nearly 15ft. and occasionally lessening to about 7ft. The joints are carefully worked and a line is chiselled along them. On the north side, where the Carthaginians attacked, the work is rougher. High walls also divided Epipolæ from the next city, Tyche, but a subterranean way along which four horses could go abreast united the two. The aqueducts entered Epipolæ beneath Euryelus, passed through almost parallel to the wall of Dionysius, and after having furnished Tyche and Achradina with water crossed the sea by the Porto Piccolo, terminating in Ortygia. There were a number of apertures in them, like wells, from which the citizens could draw water, and some of them are in use still.

The cathedral is probably the ancient temple of Minerva, since that was used as a landmark by the Greek sailors, or at least the lofty tower behind it upon which was the brilliant figure of the goddess, and the cathedral is still used for the same purpose by sailors of the present day. Moreover the twenty Doric columns still visible on one side or the other, with their archaic caps show that it was an ancient temple, and its size, which is about 61yds. in length and 24yds. in width, about the same as that of the temple of Neptune at Paestum, shows that it was an important one. These columns are 28ft. high and 6½ft. thick. It was converted into a church by Bishop Zozimus in 640 A.D. and the font was then brought from S. Giovanni. It is of marble, carved into the shape of a "krater" with two handles, and stands upon a pavement of small mosaic of the Cosmati type, with a base of bronze upon which are eight lions, each holding up his paw in an aimless manner, since the shields which no doubt were once there are gone. When the Saracens took the city in 878 it was converted into a mosque, and Saracenic battlements still crown the Doric entablature on the north side. Near to the font is a finely carved marble doorway apparently of the thir-

teenth century. Later alterations have robbed interior and façade of interest. The descriptions given by Cicero of the grandeur of this temple are dazzling. Several subterranean baths exist in Syracuse, to which one descends by forty or fifty steps. The castle, which contains one of them called the Bath of the Queen, was reconstructed by the Byzantine general George Maniaces, and some of his work still remains, though the decorative sculpture has been removed. The celebrated fountain of Arethusa, planted with papyrus and tenanted by gold fish, is enclosed in a semicircular pit railed round, as J. A. Symonds said, "like a bear pit." The fact that the water is now salt suggests that perhaps this was one of the ends of the aqueducts, damaged by an earthquake, though it is known that at Cefalù and in other places fresh-water springs rise on the shore as near to the sea as this is. The Passeggiata Aretusa close by is a pleasant promenade, planted with palms and other trees and shrubs which are exotic in England; it affords an excellent view over the larger harbour, and is a place in which one may enjoy the sea-breezes. Between the station and the town are the remains of a Roman gymnasium to which a semicircular bath is attached—a few fragments of frieze and cornice are still to be seen, but except for them the interest lies mainly in the plan.

The most important of the Christian monuments is the church of San Giovanni, founded in 1182 but afterwards frequently restored, within which are two large fluted columns which are said to have belonged to a temple of Bacchus of which there are other remains in an adjacent vineyard. Of the original building the only remains are portions of the west side, including a fine rose window, and a screen wall in front of the entrance doorway, a portion of the ancient porch or narthex. It is through this church, however, that one descends to the catacombs and the crypt of St. Marcan, which dates from the fourth century, and according to legend marks the place where St. Paul preached when he landed at Syracuse and tarried for three days. These catacombs date from the same period, and the large circular chambers which are a peculiarity of them point to their having been used as places of assembly from a very early period. They contain no remains of inscriptions or architectural decoration. The crypt is perhaps the most ancient Christian church in Sicily.

The plan is a Greek cross, four columns with caps bearing the symbols of the Evangelists supporting the roof of the central bay. From this, round-arched vaulted chapels open in each direction, through one of which the stair from the church above descends, and the angles are filled with other chapels in which, to the right, is the tomb of St. Marcan, fenced off with a low wall covered with relatively modern painted tiles. In front of it is the bishop's seat, an Ionic capital turned upside down. In the opposite corner is a column of Egyptian granite to which the saint was tied before suffering martyrdom, and here is also a rock altar at which they say St. Paul celebrated. The church also contains a few very early Christian reliefs and some badly-preserved equally early frescoes. The church of Santa Lucia is not far away; originally erected in the eleventh century on the spot where the tutelary saint of the town suffered martyrdom, but so often restored that the west door is the only portion of that period now remaining. It has columns made up of several different pieces and dilapidated lions crouching on the caps. The carving is in many places sharp and good, of Byzantine type, showing considerable use of the drill.

One of the special peculiarities of Syracuse is the "Latomie" or quarries, from which at different times the stone has been extracted for the building of the walls and edifices which have now vanished for the most part, now turned into sheltered gardens in which trees and plants flourish with great luxuriance. It was in one of these, thought to be the Latomia dei Cappuccini (where also Theocritus wandered in the days of Hiero), that the unhappy Athenian prisoners languished for eight months, till a pestilence breaking out warned the Syracusans of the wisdom of getting rid of the survivors, who were sold as slaves. The Latomia del Paradiso they say was cut by Carthaginian prisoners in the time of Gelon, the tyrant who died in 478 B.C. amid the universal grief of Syracuse and the praises of all historians of the time. In the "Ear of Dionysius," an opening off this Latomia, some excavations made some time since to ascertain the depth of the earth disclosed, 33ft. below the surface, the capital and lower parts of a column still upright. This gives one some idea of the ancient fertility of the country, though at the present time a great part of it appears to be barren rock.

According to Greek tradition Archias the Corinthian was the founder of Syracuse, in the year 734 B.C. according to an inscription in the museum at Oxford, but as he had to "drive out" the Siculi first it is evident that there was a Siculan town there already. The Siculi were reduced to the condition of serfs, according to the custom of the Greek republics, whose splendid freedom was built upon the foundation of slave labour. The government was conducted by the aristocracy, the "Geomoroi," but there was constant ferment and fighting between them and the common people, the "Cillhi," which resulted in Gelon, the tyrant of Gela, becoming supreme in 485 B.C. and transferring his residence to Syracuse. His greatest glory is the terms which were offered to the Carthaginians when they were conquered at Himera by the Syracusans and the Agrigentines. These terms stipulated for the return of the Carthaginians to Africa and the cessation of their attacks upon Syracuse, for an indemnity of 2,000 talents of silver and the erection of two temples in Syracuse to the Grecian gods, and "that the Carthaginians shall henceforth abstain from sacrificing human victims to their Saturn, a holocaust which cannot be acceptable to a divinity, and from feuds against the rights of men." The treaty was to be engraved on brazen plates and fixed up in the temple of Jupiter. The Carthaginians were so grateful for these humane conditions that they sent a golden crown of the value of 100 talents to Demareta, Gelon's wife.

After the reign of Hiero the First, at whose court Æschylus, Pindar, Simonides, Epicharmus, Sophron and Bacchylides flourished, and the expulsion of Thrasybulus, the supremacy of the city gradually extended over nearly the whole island, but the Athenian war made sad inroads on its prosperity, though it issued in the defeat of Athens. Next its territories suffered from the Carthaginian incursions and the two Dionysius and Agathocles lorded it over the town with a brief interval of democracy under Timoleon. Other tyrants followed, and Hiero the Second, whose court Theocritus and Archimedes adorned, became the ally of Rome, while a few years after his death it was taken by Marcellus, and sank to the condition of a Roman provincial town. The exactions and spoiliations of Verres gave occasion for Cicero's splendid orations, in which he describes the conditions of many parts

CHURCH OF S. GIOVANNI, SYRACUSE. DRAWN BY F. HAMILTON JACKSON, R.B.A.

of Sicily and among other towns mentions Syracuse, and enumerates precious objects which Verres had carried off; and this description shows that great splendour still remained to it at this time, since he calls it "the largest of Greek, and the most beautiful of all cities." At the height of its prosperity it contained 500,000 inhabitants.

It now because of no special importance though it suffered many things at the hands of the Greeks of Byzantium and of the Saracens, whose taking of the town was marked by especial barbarity. Its trade is unimportant, and though it is the seat of a bishop and of a prefect its inhabitants only number 23,600.

(To be continued.)

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Books on Roof Carpentry.

BELFAST.—AJAX writes: "Kindly name some books dealing with the design and construction of timber roofs for churches."

The only book on church roofs is Brandon's "Examples of Timber Roofs," 4to, with many plates (to be obtained from Mr. B. T. Batsford, 94, High Holborn, for £1 4s., published at £3 3s.). This has a good series of illustrations of ancient work. Roof carpentry in the ordinary way is dealt with in the standard books on this subject, such as Tredgold's, Fletchers', or Collings's "Roof Carpentry" (2s.).

Tile Manufacturers.

Referring to the enquiry on p. 30 of our last issue, the address of Messrs. J. & W. Wade & Co. is—The Flaxman Tile Works, Burslem, Staffs. (London office: 4, Thavies Inn, E.C.)

Books on Carpentry and Building.

ASCOT.—H. S. C. writes: "Kindly forward catalogue of books relating to carpentering, building, &c."

Write to Mr. B. T. Batsford, 94, High Holborn, W.C., for his list.

Liability of Architect for Smoky Chimneys.

BIRMINGHAM.—A. B. C. writes: "Is an architect responsible to his client for smoky flues? The house was built twelve months ago, and much trouble, annoyance and expense have been caused by several of the flues smoking: many types of cowls have been fitted, but all to no purpose. The architect superintended the building of the flues, and all the usual precautions were taken. Can the client enforce his architect to pay for the cowls and labour?"

An architect is liable if he does not exercise reasonable skill and care, but it is very difficult to determine what that is. If an employer accepts the services of an architect whom he knows has had limited experience and training he does so at his own risk, and the architect is not liable. If an architect can prove that he took such steps as any architect would have taken in a certain case he is under no liability. It would be absurd if an architect were held responsible for smoky chimneys, as the causes are generally beyond his control, due to surrounding trees or overtopping buildings, &c., and if the usual precautions were taken in building the flues there is no liability. The client, we do not consider, can force the architect to pay for cowls and labour.

Repairing Leaky Concrete Flat.

ENQUIRER writes: "A concrete flat, the roof over a large room, averages 6in. thick and has a slight gradient towards the gutters, all floated with 2in. cement, 1 to 1. The wet comes through one part sufficiently to disfigure and damage the ceiling. Can you suggest a composition to prevent this? It would spoil the gradient if I had the part cemented over again,

and whatever is done must be at the least possible cost."

We advise you to coat the part through which water percolates with pitch or asphalt. The latter is more expensive, but is more lasting and stands much wear.

Deadening Sound between Bedroom and Kitchen.

ASHFORD.—DISTRACTED writes: "The principal bedroom in my house is over the kitchen, and all the talking of servants and every sound that takes place in the kitchen is distinctly heard in the bedroom. The ceiling of the kitchen is not plaster but 'compo-board.' I have had the floor boards of the bedroom taken up and fully 9in. of sawdust put between each joist, but this makes not the slightest difference. I do not want to take down the ceiling and sawdust and substitute a plaster ceiling, as this would incur much inconvenience and expense. The bedroom fireplace is in the same stack as and directly over the kitchen range, so that the slightest movement of the dampers is heard distinctly in the bedroom. Can you suggest a remedy?"

We advise you to take the floor boards up and put two thicknesses of felt under them. The best remedy would be to remove the present ceiling and use, say, Frederick Jones & Co.'s silicate cotton and plaster slabs. We do not see how you can stop the noise from the kitchen dampers being heard in the bedroom.

Books on Building Stones, Architectural History and Timber.

SUNDERLAND.—ENQUIRER writes: "(1) Please recommend a book on the formation of Building Stones. I have 'Specification' No. 5, Rivington and Mitchell, but I want one to assist me in locating the stones as far as possible in their original formation: also a map of England showing where the different stones crop up. (2) Would Mr. Banister F. Fletcher's book be sufficient for the history section of the R.I.B.A. examination, and what book would you recommend for the mouldings' section? (3) Can you recommend a book on the timbers in use in this country?"

(1) Hull's "Treatise on Ornamental and Building Stones of Great Britain and Foreign Countries," 12s., Macmillan & Co. Geological maps are sold by George Philip & Son and Edward Stanford. (2) A list of works which should be consulted is given in the R.I.B.A. Calendar, 2s. 6d. (3) "The Practical Timber Merchant," by W. Richardson (Crosby Lockwood & Son, 8s. 6d.).

Book on Theodolite.

STAFFORD.—A SUBSCRIBER writes: "Which is the best book on theodolite work, setting-out, &c.?"

"Land and Engineering Surveying" by H. S. Merritt and G. W. Usill (E. & F. N. Spon, 12s. 6d.).

Book on Perspective.

PERSPECTIVE writes: "Please recommend a good book on architectural perspective to study at home."

"Linear Perspective," by G. A. T. Middleton, (B. T. Batsford, price 1s.).

Architects' Registration.—At a meeting of the Plymouth, Devonport and Stonehouse branch of the Devon and Exeter Architectural Society held last week at Plymouth an address was given by Mr. Silvanus Trevel, F.R.I.B.A., P.S.A., on "The Statutory Registration of Architects." Mr. Charles King, F.R.I.B.A., president of the Three Towns branch, took the chair. A resolution approving the principle of statutory registration was carried unanimously.

Chelsea Baths Competition.—Mr. R. Norman Shaw, R.A., the assessor in this competition, placed the designs with the following numbers in order as the best:—Nos. 21, 45, 14, 15, 26 and 47. The Chelsea Council have, however, reversed the order of the first two, awarding the first place to No. 45, by Messrs. Harnor & Pinches, of John Street, Adelphi, W.C., and the second place to No. 21, by Messrs. Wills & Anderson, of Adam Street, Adelphi, W.C. No. 26, which takes the third place, was by Mr. F. J. Smith, F.R.I.B.A.,

R. I. B. A.

SMOKE ABATEMENT.

A SPECIAL general meeting of the Royal Institute of British Architects was held last Monday evening (Mr. William Emerson presiding) to elect the Royal Gold Medallist for the year. Mr. Emerson said he had to announce the saddest thing in the annals of their history, the death of Mr. Bentley, whose name had been submitted for election. The Council under these circumstances could not fix upon any course until the King had decided what was to be done, whether to give the medal to Mr. Bentley's family or not. A letter of condolence would be sent to the widow of Mr. Bentley. Mr. Emerson then referred to several of the best known works of Mr. Bentley, among them being the Brooklyn Roman Catholic Cathedral at New York; St. Mary's, Cadogan Square, Chelsea; the church of the Holy Rood at Watford; the restoration of St. Botolph's in the City; the decorations for St. Mark's, North Audley Street, London; the Priests' Seminary at Hammersmith; the church of Corpus Christi at Brighton; and the church of St. Francis at Notting Hill, W.

A general meeting followed. Mr. Charles Henry Gage having been elected an Associate, Sir Benjamin Stone, chairman of the National Photographic Record Society, gave a short account of the aims and methods of the Society, in reference to an exhibition of about a hundred photographs of architectural work, forming part of the collections of the Society, which is on view till Saturday next prior to the collections being deposited in the British Museum. Mr. Alexander Graham, the treasurer of the Society, testified to the value of the work it was doing.

Sir William B. Richmond, K.C.B., R.A., then moved the following resolution: "That in view of a resolution of the Coal Smoke Abatement Society, seeking the co-operation of the Institute, members are invited to join the Society, or that such other assistance be given by the Institute as the Council may deem desirable." Sir William Richmond urged the architectural profession to use every effort to get smokeless grates adopted in buildings of all kinds so as to purify our atmosphere and prevent the detrimental effect it has on buildings.

Mr. John Slater seconded, and Prof. Church referred to the action of soot in absorbing the acids, tarry matter and ammonia vapours produced in the combustion of coal and in depositing them on buildings, and so becoming the chief cause of corrosion.

Dr. Des Vœux spoke of some experiments he had carried out with Mr. Bryan Donkin on ordinary grates and open-fire grates claimed to be smoke-consuming. Five "smokeless" grates had been tested and four had been found to materially diminish the smoke, while one of the four practically did away with any smoke and gave 50 per cent. greater heat than the best of ordinary fires, and burnt 25 per cent. less fuel than the best of the grates tested and 50 per cent. less than the ordinary grate. An account of these tests would shortly be published in full in "The Lancet." He suggested a central body should be formed to test various grates and decide the best to use. Gas was cheaper and better for use in kitchens for cooking, &c., the only difficulty being to get hot water, but he had found this was best obtained by using a coke boiler, which cost about 1s. 6d. per week in the summer or 2s. in the winter, giving for this sum hot water at any hour of the day or night.

Mr. W. D. Caröe suggested that the gas companies would find it a paying investment if they installed, free of expense, gas burners under grates in the houses of the poorer classes which could be used for lighting coke fires. By this means the present grates could be used for giving smokeless and cheaper fires at a very little expense for alteration.

Dr. G. Wyld said a blower prevented smoke to a great extent, but it was surprising how few were used in connection with ordinary grates.

Mr. E. W. Hudson, Mr. Julian Corbett and Mr. C. H. Brodie also spoke. The resolution was carried unanimously.

L.C.C. BRICKLAYERS.

At last week's meeting of the London County Council the Finance Committee presented a report in regard to the number of bricks laid per day by the bricklayers employed in the construction of works by and for the Council.

Lord Welby said that a specified number of bricks was arrived at by taking the actual number of bricks used, divided by the number of days. The time did not include the cutting and rubbing. He did not think it desirable to give

the actual price paid, and the Sub-Committee on Works did not think they were justified in giving the actual number of bricks laid in the Works Department. Mr. Beachcroft asked Lord Welby whether he knew that in the construction of the Westinghouse Works the number of bricks laid per man per day was 1,400. Mr. Burns asked what was the thickness of the walls, was mortar or cement used, and did the work in any way resemble the class of work done by the Council on fire stations or lunatic asylums. Lord Welby said that one class of work was hardly comparable with another. Captain Swinton moved

that the report be not received, and pointed to the gravity of the charges made in "The Times." They were not there to make London the cockpit for Socialistic theories. Mr. R. Williams said that, taking everything into consideration, he should be satisfied if a man laid from 350 to 400 bricks a day. Mr. Taylor was astonished that so much importance should be attached to the scribbles in "The Times" on questions of which they knew nothing. He had a very shrewd suspicion that this attack was organised by brick manufacturers. It was true that bricklayers now laid fewer

GATE OF THE CASTLE OF MANICES, SYRACUSE. DRAWN BY F. HAMILTON JACKSON, R.B.A.

bricks per day than they did twelve or thirteen years ago, but the hours of labour had been shortened and the class of work now demanded was very different. No complaint was made in regard to workmen restricting their output until they definitely refused to scamp work any longer. He challenged any one to say that the workmen did not at present give better work than ever before. Mr. White pointed out that neither Mr. Taylor nor any previous speaker had denied that the number of bricks stated in "The Times" as being laid per man per day was right. There was really no difficulty in finding out whether "The Times" was right or not. It was an extraordinary omission that no specific account had been kept of the cost of brickwork in the Works Department. The whole result of the operations of the department showed that they were not getting enough work for the money. Sir A. Arnold could not imagine any one reading the report and considering it quite satisfactory. He saw considerable objection to the committee's stating the number of bricks laid by bricklayers on any job. If they were to mention any particular number it might be taken as a maximum standard for the future. The committee might, however, with advantage give the cost of the brickwork per rod. The information given in the report was, perhaps, not quite satisfactory, but he could see no reason for rejecting it.

In the course of the debate reference was made to an estate that is being developed in the suburbs. The houses specified were three-storey semi-detached villas, let at £55 to £60. The external walls for ground and first floors were 14 in. material, and division walls 9 in. and 4½ in. The labour on brickwork was let piecework. One man laid 2,000 bricks in foundations the first day, and four subsequently laid no fewer than 4,300 London stock bricks till the job was nearly done and two of the men were taken off to start a new house.

On a division 87 voted for the reception of the report and 26 against. The report was then received.

New Patents.

These patents are open to opposition until April 5th.

1901.—Window-Blind Brackets.—2,203. J. CHALLENGER, 21, Beaumont Road, North Ormesby, Middlesbrough. The bracket has a slot at one end to receive the roller-pin, and cast on the other end is a wood screw about an inch long: consequently no screw-driver is needed, so that the bracket can be fixed very quickly.

Cement Pipes.—5,045. F. E. BOCQUET, 35, Boulevard Haussmann, Paris. Expanded metal is bent into pipe form and wound round with wire (or a layer of asphalted cloth may be introduced). This strengthening framework is then covered with cement inside and out.

Laying Damp-courses.—5,759. A. DISS, 21, Stanwell Street, Colchester. This invention consists of a cast-iron frame having parallel side-bars arranged to slide and be fixed on two cross-bars, so as to suit the width of the wall. After the damp-course is laid this frame is slid along the top of the wall, and so forms a true and uniform course having clean edges and requiring no raking or pointing.

Slag Cement.—23,443. C. VON FORELL, 26, Deichstrasse, Hamburg. Highly-molten slag is driven by a powerful jet of steam against a chilled surface protected by smooth iron plates, so that it becomes flattened and falls into a cooling drum, which can also be used as a transporting apparatus. The resulting clinkers are altogether different in their structure from slag granulated in the ordinary way, being desulphurised and made ready for grinding.

The following specifications were published on Thursday last, and are open to opposition until April 12th. The name in italics is that of the communicator of the invention. A summary of the more important of them will be given next week.

1901.—2,653, WILSON, appliance for removing obstructions in gulleys, pipes, &c. **2,904, WRIGHT,** building bricks and blocks. **3,969, DOWNIE,** lift valves. **5,678, RICHTER,** ap-

paratus for moistening air. **6,223, CHARMAN,** folding combination ladders, stepladders, trestles, &c. **6,433, VIQUIS,** lock. **6,835, HOWELL,** casement stay fastenings. **6,844, ERSKINE,** machines for rolling felt. **7,258, GEOFFROY,** compositions for removing paints. **11,337, CORBETT,** apparatus for manufacturing white lead. **19,608, MAHER & BARNER,** machines for grinding, smoothing and polishing glass. **23,583, GREEN,** ventilating roofs of stables, cowhouses, &c. **23,724, MAY,** window-sashes. **24,114, SWEETING,** fastener for window-sashes. **24,557, SACHS,** fuse plugs for electric cut-out blocks. **24,798, KELLY,** heat-insulating board, tile or slab. **24,906, DAY (Roberts),** gates. **24,948, GUILLOU,** parquetry or separable floorings, boarded ceilings, &c.

1902.—50, GIBBARD, wood-paving for covered footways or floors. **90, JONES & JONES,** airtight inspection-covers for drains. **386, WOLSKEL,** preparing asphalt.

Keystones.

The New Millbank Board School, erected by the School Board for London in Erasmus Street, Westminster, was opened last week.

Moorfields derived its name from the filling in by water of a large space caused by the removal of clay for pottery and bricks.

New Cold Stores are about to be constructed in Tooley Street, E.C., by the London Cold Storage, Ltd. The architect is Mr. W. H. Waterman, of 7, Cullum Street, E.C.

The Manchester Hotel, Hull, has been remodelled. Mr. James Martin, Temple Street, was the contractor for the building, plastering and joinery work; Mr. C. G. Brett for the ironmongery; Wokes & Co. the electric lighting; and Mr. Fred Sweeting for the marble work.

Acoustics at the Law Courts.—Mr. Justice Buckley has caused to be fitted a series of transverse wires beneath the roof of the Chancery Court, with a view to the improvement of the Court's acoustic properties. In this respect the Law Courts are notoriously defective.

Christ's Hospital.—Lord Balfour of Burleigh has issued his award arising out of the arbitration recently heard between the Governors of Christ's and St. Bartholomew's Hospitals. The amount to be paid by the authorities at St. Bartholomew's for the 67,630 sq. ft. of land taken is £238,781.

The Swansea Harbour Trust.—Offices are now being erected from the competitive designs of Edwin Seward, F.R.I.B.A., of Cardiff, which were selected by the assessor, Professor Fawcett, M.A., of Cambridge. Cattybrook bricks, with dressings and bands of Portland stone, are being used on a sub-storey of green-tinted Bridgend stone.

Camberwell Infirmary.—The following particulars came to hand too late last week for publication in the same issue as the illustrations:—The new buildings of the Camberwell Infirmary cover a site of about 4½ acres. The principal or west frontage is that shown in our view, being towards Brunswick Square. The infirmary is otherwise bounded by Brunswick Road on the north, Havil Street on the east, the Glebe road on the south. The infirmary when complete will consist of the central administrative block containing all the offices, committee rooms, &c., the residence of the medical superintendent, of the matron and sisters; six large blocks for patients, containing in all beds for 716 adults and eighty-eight children; the female staff home, with ample accommodation for the large staff of nurses and servants necessary for such an institution, receiving rooms, isolation wards, kitchen block, steward's stores, with residences for men over, laundry for patients and staff, with boiler-house, engine-rooms, &c., in the basement. The mortuary, post-mortem room, stabling, &c., are to the south of these. The buildings will be heated by hot water and lighted by electricity. The lifts will be electric. There is an operating theatre with anæsthetic room, laboratories, &c., attached. The whole building is connected by glass-covered ways. The contractors are Messrs. Holliday & Greenwood, of Brixton. The architect is Mr. Edwin T. Hall, F.R.I.B.A., of 54, Bedford Square, W.C.

Trinity Congregational Church, Walthamstow, is being enlarged from designs by Mr. Williams Durnford, of 100c, Queen Victoria Street, E.C.

The Band of Hope Jubilee Building is being erected at 59 and 60, Old Bailey, E.C. The architect is Mr. Rowland Plumble.

Three Stained-Glass Windows at Churchill have been placed in the Wesleyan schoolroom. The school is part of a Gothic block of buildings including a chapel. They have been executed by Mr. James P. Young, of 382, Gloucester Road, Bristol.

The Court of Common Council have agreed to raise the salary of the principal clerk of the Works Department from £500 to £600; that of the assistant architect for buildings and assistant architects for repairs from £400 to £450, and that of the assistant to the measuring surveyor from £300 to £360 by increments of £15 per annum.

Hull Improvements.—The Prince of Wales has been invited by the City Council to visit Hull in September or October next for the purpose of inaugurating a new city square, to unveil a memorial statue of Her late Majesty to be erected in the square, and also to lay a memorial stone in connection with the extension of the Hull Royal Infirmary.

The Manchester Society of Architects held its monthly meeting on 13th February. Mr. A. Darbyshire, president, in the chair. Mr. Charles M. Hadfield, A.R.I.B.A., read a paper on English architecture of the fifteenth century, illustrated by lantern views. The prize for the students' monthly competition was awarded to Mr. Warren Blackshaw, junior, of Stockport, for a design for a factory chimney.

Honey found in a Roof.—A big find of honey has just been made at Tydd St. Mary, Lincolnshire. For some years past there have been two swarms of bees in the roof of Strawberry Hall, the residence of Alderman T. W. Banks, who offered the honey to anyone who would shift the bees and make good the roof. Mr. Carbutt, builder, of Long Sutton, accepted the offer and obtained nearly 20 stones of honey.

"Humour in Greek Art" was the title of a paper by Mr. Arthur Hamilton Smith read before the Hellenic Society last week. He said that in the survivals of early art it must be admitted that the humour was often unconscious, and one laughed at rather than with the artists. At the same time, it was sometimes clear that the painter or sculptor realized the effect which would be produced on the critical observer.

A Chapel at Norwich has been erected in the grounds of the Norwich and Ely Diocesan Training College as a memorial to Canon Hinds Howell. Mr. Bodley, R.A., is the architect. The plans have been only partially carried out, as the chancel and cloister connecting the chapel with the main building have yet to be provided when funds permit. The chapel is dedicated to St. Etheldreda.

The Garden City Association is making good progress. Among its latest adherents are the Lord Bishops of London and Hereford, Mrs. Marie Corelli, Madame Sarah Grand, H. G. Wells and W. H. Lever: while of its members, the Countess of Warwick and Mr. T. P. Ritzema (the new manager of the "Daily News") are indefatigable. The present quarters of the Association at 77, Chancery Lane are becoming inadequate for the work to be done.

The Tenancy of Leighton House has been transferred by the proprietors to Mr. and Mrs. Russell Barrington, and who have undertaken till further notice the whole responsibility of the maintenance of Leighton House and the safe keeping of its contents. With respect to the concerts, lectures, loan exhibitions and the arrangements for admitting the public to view the house and its contents, everything will continue to go on exactly in the same way as heretofore, under the management of the same persons who formed what was called the Entertainment Sub-Committee. All pupils of the Royal Academy and other art schools on showing their students' tickets will be admitted free on all week-days not only to view the house and the permanent collections but any loan exhibition that may be on view.

"THE GABLES," FOUR OAKS, NEAR BIRMINGHAM: MODELLED PLASTERWORK IN BAY
BY ERNEST GIMSON.

Bricks and Mortar.

APHORISM FOR THE WEEK.

*In all new work that would look forth
To more than antiquarian worth,
Palladio's pediments and bases,
Or something such, will find their places.*
CLOUGH ("Dipsychus").

Our Plates.

THE house at Four Oaks, near Birmingham, was built for Mr. Montague Fordham and enlarged to its present size for Mr. A. E. Hills, the present owner. It is built of local brick, plastered with cement mixed with local sand, which, being red, produces in combination with the cement a warm brown colour. It is roofed with old tiles taken from houses recently pulled down in Birmingham. The modelled plasterwork in the bay-window of the drawing-room is by Mr. Ernest Gimson, of Pinbury, Cirencester. The architect is Mr. Allen S. Dixon, M.A., of 297, Broad Street, Birmingham.—"Bardencroft," Saltburn-by-the-Sea, has been erected for Mr. William I'Anson, upon a corner site, the front overlooking the beautiful public gardens, with an extensive sea-view beyond. The entrance has a south-west frontage. The building is of red brick having a red tiled roof with yellow rough-cast gables. The whole of the woodwork being painted white produces a very pleasing effect.

Brighton Aquarium.

BRIGHTON AQUARIUM is proposed to be improved by the Town Council at a cost of £30,000. It is proposed to do away with the existing theatre-stage, property and artistes' rooms—and the three tanks immediately adjoining it, and utilise the site thus obtained for a concert-hall, with new stage, gallery and the necessary retiring-rooms. The space now used as a stage and property room will revert to its original purpose as a waterfall. The wooden covered way from the entrance gates to the entrance hall will be replaced by a decorative covered way of glass and iron, and a new external porch to the entrance hall provided. Over the new concert hall and waterfall terraces will be formed. A great amount of repairing and decorative work and many minor improvements are proposed, improved heating apparatus, and the substitution of electricity for steam power generally. Mr. Tiltman's estimate of the cost of the work is £29,098.

Tudor and Elizabethan Architecture.

Mr. T. COLLINS, curator of the Art Museum, Ancoats, in delivering a lecture on "Tudor and Elizabethan Architecture," said this style of building was the result of a

gradual growth of an improved spirit in society. The Tudor style was the result of a blending between the castellated or semi-Norman style and that of the debased Gothic; and the mixture of the Tudor with the Italian or classical architecture gave us what is known as the Elizabethan. It was during the early period of English architecture that this movement towards the domestic style of architecture received its greatest impetus by the law of King Henry II., which forbade any building to be fortified without special permission. The progress was furthered again by the action of King Edward I., who after conquering Wales, desired to live with his Welsh people and built for himself the castles of Conway and Carnarvon. Here the oriel chamber, the oratory, and the use of glass for windows indicated an attention to domestic comforts. Another cause helping on the movement was the disbandment of the Freemasons by King Henry VI. Perhaps the

two most important causes were the growth of heraldry as a decorative means and the Reformation, the last named being the cause of bringing to an end the construction of Gothic ecclesiastical buildings. John of Padua, who was appointed shortly after the accession of King Edward VI. to be deviser of the King's buildings, was probably the first to introduce the classic features of buildings.

Restoring York Minster.

FOR nearly three years a massively-built scaffolding has enclosed the north-west tower of York Minster, leaving only the topmost parapet and pinnacles—200ft. above the pavement—exposed to view. The restoration of the upper portion (about 80ft.) has now been accomplished; three of the eight stages or storeys of the scaffolding have been taken down and the fourth will soon follow. Only absolutely necessary renewals have been carried out. Wherever possible, the old work has been retained. In many cases, however, the action of the atmosphere had practically eaten everything away and the staff of carvers had then to make careful copies of Perpendicular work under the direction of Mr. Green, the Minster clerk of the works, and these were submitted to Mr. G. F. Bodley, A.R.A., for his approval before being placed in position. Each of the four faces of the tower has been thoroughly repaired. Care has been taken to make all the new work solid and to have it well bonded in. The tracery of the four huge belfry windows, through which "Great Peter" sounds forth, has been taken down and partially renewed. The mullions were even in worse plight than the tracery; they had to be removed, and other stones, moulded as they were, stood in their stead. Finials, gables and gargoyles had also to be re-erected. The scaffolding cost £800; and although the staging has stood for nearly three years no expenditure for keeping it in repair has been necessary. The magnesian limestone used in previous restorations has not worn well; the face having peeled: this, however, is most rapid where the stone is sheltered from the rain, as may be seen from the present condition of the unrestored portions of the west front. Where the stone has been freely exposed to the rain the surface is almost unbroken, which, so far as it goes, is evidence that the rainwater neutralises the effects of the atmospheric acids. In the present restoration the authorities have discarded magnesian limestone in favour of a cross-grained oolite obtained from Ketland in Rutlandshire.—(Extracts from the "Yorkshire Herald.")

DRAWING-ROOM, "THE GABLES," FOUR OAKS, NEAR BIRMINGHAM. A. S. DIXON, ARCHITECT.

Builders' Notes.

Mr. F. Clarke, builder, Yoxford, died recently.

Mr. Isaac Osborne, builder and timber merchant of Diss and Roydon, died recently at the age of sixty years.

The Oldham and District Master-Builders' Association held its annual dinner recently. Mr. S. Smethurst, J.P., presided. The annual report stated that the membership numbered 144, an increase of thirteen during the year, and that the financial position was also satisfactory.

Three Tenders Equal.—A remarkable result occurred in the tendering for a shop at Wealdstone, Harrow. Messrs. Clarke & Charles were the architects, and no quantities were supplied. The three firms of builders competing sent in exactly the same price, namely, £650. The result will be found stated in full in our "Tenders" columns.

Re William Fear.—The adjourned first meeting of this debtor (a builder of 138, Jedburgh Road, Plaistow) was held last week in the Court of Bankruptcy. The statement of affairs showed liabilities £27,308, of which £4,128 was expected to rank, and assets nil. The debtor attributed his failure to losses through speculative building. He made no proposal to the creditors.

The Builders' Clerks' Benevolent Institution held its annual meeting last week. Mr. Frederick Dove, of Messrs. Dove Brothers, presided. The report stated that £697 13s. 3d. had been received in the course of the past twelve months, and the sum of £586 8s. had been paid in pensions,

in addition to £10 in temporary grants. There were twenty-five pensioners on the books—a record number for the society. On the motion of Mr. O. Newling a resolution was adopted enabling provincial members of the trade to take advantage of the benefits of the institution.

The Plumbers' Registration Bill, piloted by Lord Glenesk, passed through a Committee of the House of Lords last week.—A public meeting of health and water authorities and plumbers of the North of England was held in Carlisle recently. Alderman Crowder, ex-Mayor, presided. On the motion of Bailie Dick, chairman of the Health Committee of Glasgow, seconded by Mr. C. W. Hill, chief sanitary inspector, Carlisle, it was resolved that the Government, acting in the public interest, should carry through the measure.

The Aberdeen Master House Carpenters' and Joiners' Association held its annual dinner recently. Mr. J. A. Smith (of D. Macandrew & Co.), president of the association, occupied the chair. Mr. John Brown, of Redhall, gave the toast of "The Architectural Profession," associating with it the name of Mr. James Souttar, who received his training in the office of the late Lord Provost Matthews, who had done splendid architectural and public works in Aberdeen. Mr. Souttar, in reply, suggested that in the matter of contracts master-builders should make sure at the outset that these were properly and legally drawn, for it was better to have one lawyer at the beginning than two lawyers at the end.

Correspondence.

Architectural Examinations.

To the Editor of THE BUILDERS' JOURNAL.
LONDON, S.E.

SIR,—My attention has been called to Mr. Howard Seth-Smith's letter in your issue of February 19th. I should like to point out that "the first principle" to which he alludes has never been departed from, namely, that the Royal Institute should be the sole examining body for England under the proposed Registration Bill. The Society of Architects has passed through various stages of criticism. It was formerly accused of receiving anyone who chose to apply. While not admitting this as a fair imputation, it eventually decided that all candidates under a certain age should pass a qualifying examination before being proposed to "membership." Surely there can be no harm in this restriction, especially as a certificate of having passed the R.I.B.A. examination is accepted in lieu of this Society's examination. The members surely have the right of saying who shall or who shall not be admitted into the Society, and it was only with the object of raising the standard of efficiency that an examination was decided upon. From the first I felt Mr. Seth-Smith was taking a wrong view of the case, and he appears still to persist in opposing a harmless test of qualification for membership.

ship, although it has greatly assisted the work of the Society and raised the standard of efficiency of its members. I cannot understand a past-president of our Society stating that he "shall continue to oppose the policy it is pursuing by every possible means." He is quite welcome to do this, but he will find it a much more useful and congenial task to advocate the legal registration of every properly-qualified architect of which he professes still to be an advocate.—Yours truly,

ELLIS MARSLAND,
Hon. Secy., Society of Architects.

Society of Architects.—Messrs. C. H. Stott (Pietermaritzburg, Natal) and A. Swash (Newport, Mon.) have been elected members of this Society, and Messrs. H. T. Cook (Southend-on-Sea), S. C. Hanson (Southend-on-Sea) and W. D. Williams (Redruth, Cornwall) have been elected students.

The New Denbigh County Schools are being erected between Middle Lane and Beacon's Hill. The building is designed in the Tudor style, and is faced externally with limestone. The main walls are lined with brick, and all inside walls are also of brick. The contract for the erection of the school buildings, exclusive of furnishing and of boundary walls, fences, drives, &c., is £23,000, the contractor being Mr. G. H. Marshall, of West Smethwick, near Birmingham, who is carrying out the works from the designs and under the superintendence of Mr. James Hughes, architect, Denbigh.

Engineering Notes.

Mr. Arthur Pye-Smith, managing director of the well-known St. Pancras Ironwork Co., Ltd., has lately been appointed a justice of the peace in the county of Middlesex.

St. Andrew's Church, Colyton, has lately been fitted with "small tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, who have employed their economical coil-heater with waterway firebrass.

Avonmouth's New Dock.—The tender of Sir John Aird & Sons, of Westminster, contractors, has been accepted by the Bristol Docks Committee for the constructional works of the new ocean dock at Avonmouth. The amount of the tender is slightly under £1,400,000. There were fifteen tenders, and the highest exceeded £2,000,000. The work is to be finished in five years, and is estimated to cost £2,000,000 in all.

Illuminations for the Victor Hugo Fetes in Paris.—The E.L.B. system, which the public are only just commencing to take up in this country for the coming Coronation festivities, has again had a remarkable success to report from Paris, where the municipality placed the whole of the contract with the Electric Lighting Boards Co. for the illuminations in connection with the great Victor Hugo ceremonies recently. These illuminations comprised a temporary installation of no fewer than 25,000 8-c.p. lights.

Margate Water-Supply.—A poll of the ratepayers of Margate has been taken on the proposal to promote a Bill in Parliament for powers to carry out a scheme of water-supply. A scheme has been devised by the borough engineer, Mr. Albert Latham, to obtain a supply from the hills in the district of Wingham, 14 miles from Margate. The scheme is estimated to cost £90,000, but the corporation have agreed, in order to avoid opposition, to supply fifteen parishes in the district, and powers are sought in the Bill to borrow £120,000. More than 3,000 votes were recorded in favour of the proposal and 1,700 against.

Masters and Men.

A Slate Famine Feared.—A number of slate merchants in North Wales are busily stocking slates, as it is feared that a slate famine is imminent. There are already indications that trouble is looming ahead irrespective of the deadlock at Lord Penrhyn's quarries. The men are busily enrolling themselves in the Quarrymen's Union, and since the beginning of the year the membership of that union has rapidly been increasing. At Festiniog, where close upon 6,000 quarrymen are employed in the different mines, matters are decidedly disquieting. Trades union feeling is strong, and the workmen maintain that as the price of slates has increased and that the market generally has improved they ought to have a share in the benefit. No actual application has been made for an increase of wages in a formal manner, but this may be expected at an early date.

The Law as to Picketing.—The Parliamentary Committee of the Trades Union Congress has published the proposals of the committee for protecting the funds of trade unions in view of the recent decision as to the liability of unions for the acts of their members in picketing cases. The salient feature of the clause proposed to be made operative by legislation is that "peaceful persuasion" by pickets, if it does not foster breach of contract, shall be permissible, and that such action shall not be deemed a "watching or besetting" within the meaning of the Conspiracy and Protection of Property Act, 1875. With reference to the safeguarding of trade union funds, the committee submits a suggestion that each union should have a subsidiary limited liability company registered under the Companies Acts, 1862 and 1890. This company would attend to the sick and benefit business, and would have the power to make grants in loans to the union with which it was connected, should that union be in need of funds at any time.

IDEAL PLUMBING.—II.

By G. A. ALLAN, Plumbing Instructor, Trades Training School.

(Continued from p. 438, No. 865.)

THE form of intercepting trap to be used will depend on the amount of fall that can be given to the drain. Those are best which have a vertical drop of 3 in. from the drain into the trap (Fig. 5). The sewage falling on to the body of water in the trap has a tendency to drive under the surface and carry with it any matter floating in the body of the trap. When the available fall for the drain is very slight 3 in. cannot be spared for this form of trap. One must be used with inlet and outlet at the same level (Fig. 6). The diameter of the trap should be restricted at its lowest parts, as it is then more self-cleansing. Every intercepting trap should be provided with a cleaning arm or socket doors (as shown in Figs. 5 and 6), by means of which a rod can be passed into the section of drain between the interceptor and the sewer.

With iron drains laid in the manner recommended the ordinary manhole with half-channel is not built. Manholes are built round the access pipes, but they need not be water-tight. The movable doors on the access pipes are more easily manipulated if the bottom of the manhole be about 1 ft. below the bottom of the pipe. Ordinary galvanised-iron manhole covers can be used; those that lock are preferable to those that have no fastening.

At the head of all drains having a fall of less than 1 in 40 a flushing tank should be placed; an automatic flushing tank should be fixed where they are allowed; when these are not allowed a tank flushed by pulling a chain is fixed. It should be a definite part of someone's duty to flush the drain each day. I have seen a flushing tank holding about 250 gals. fixed at the head of a drain and receiving the waste water from a bath and a lavatory basin. The waste water remained in the tank until the accumulation filled it, and when a further discharge would start the syphon and discharge the tank. This was good for the drain, but the retention of foul water on the premises was bad and the inside of the tank smelled abominably. A tank fixed to receive rainwater and to be flushed automatically when it had not the same defect, but was useless in a drought, when the drains needed flushing most.

The question as to what material soil-pipes shall be composed of is still debated in this country. In America the question was long since settled in favour of iron. W. P. Gerhard in his "Drainage and Sewerage of Dwellings" says, "I shall not dwell on the well-known defects of lead soil-pipes; although still the rule in England, they have, fortunately, in this country become a thing of the past, and when found upon examination of houses built years ago are invariably condemned and removed."

In England until recently the question was definitely settled, but in favour of lead. Now iron soil-pipes are used on good work; they are regulated by by-laws of the London County Council, and there is no doubt that their use is tending.

The requirements of the London County Council with regard to the thickness and weight of cast-iron drains and soil and ventilation

cast-iron soil-pipes of the thicknesses and weights specified by the London County Council. Soil-pipes should be fixed outside the building. In cases of re-draining existing buildings it may be necessary to fix the soil-pipes inside the building. In London in such a case the by-laws require the soil-pipe to be of lead. Wherever lead is not compulsory iron soil-pipes should be used. A large experience both in England and America as plumber and sanitary inspector compels me to the conclusion that in requiring the use of lead for inside soil-pipes the London County Council have made a mistake, and as the model by-laws of the Local Government Board issued thirty-four years ago are still considered "model," so a by-law once issued by the London County Council is supposed to remain unaltered to the end of time. It is not likely therefore to be amended.

The soil-pipe should be carried up on brackets (Fig. 7) about 3 in. from the wall, as by this arrangement they are accessible all round. Ventilation pipes should be carried up in a similar manner. Both soil and ventilation pipes should be carried up to a position clear of all windows and chimneys and as high as the ridge of the roof of the building against which they are fixed. No cowl should be used, but the open ends of the pipes should be protected by ordinary balloon wire-guards.

In lecturing at the Sanitary Institute the late Sir Douglas Galton was very emphatic not only as to the uselessness of all cowls on soil and ventilation pipes but as to their pernicious influence. He said that the open end of the pipe would ensure as good an upcast as any cowl. If a greater current were desired than the open end of the pipe would yield, it could always be obtained by enlarging the pipe for 1 ft. or more at the top. By adding, say, 2 ft. of 8 in. pipe to the top of a 4 in. soil-pipe the upward current in the 4 in. pipe would be quadrupled. The wind blowing across the open end of the pipe induces an upward current in the pipe depending not on the diameter but on the force of the wind. The current in the 8 in. pipe would be as great as it would be in a 4 in. pipe open at the top; and as the area of the 8 in. pipe would be four times as great as that of the 4 in. pipe the current in the 4 in. pipe must move four times as fast to supply the air extracted. In practice the current produced by the wind blowing across the open end of a 4 in. pipe is as great as

FIG. 11

FIG. 12

FIG. 13

FIG. 5

only cause an upcast when wind is blowing. In calms, when no upcast is caused by wind, the slight movement of air due to differences of temperature between the inside and outside of the drainage system will not be obstructed by the open end of the pipe as it would be by a cowl. Some sanitarians advocate the use of a cowl because, though they acknowledge it has no other use, it prevents a downdraught. But if the drain is ventilated as hereafter recommended no harm can possibly be done by downdraughts.

Every branch of the soil-pipe should be ventilated to prevent stagnation of drain air in the branches. With foul gases in the soil-pipe and in contact with the water in the closet traps the water soon becomes saturated with the foul gases which are given off on the house side of the traps.

This does not occur when the soil-pipe branches are ventilated. This branch ventilation is best accomplished by connecting a 2 in. pipe to the branch near the trap. This 2 in. pipe also acts as an anti-syphonage pipe to the trap. It should be connected to the soil-pipe about 3 in. from the highest part of an S trap or about 9 in. from the highest part of a P trap.

This trap ventilation-pipe, as it is generally called, should be carried up at the side of the soil-pipe and should terminate at the same level. It should never be connected to the soil-pipe above the highest branch, as is always recommended, but should be kept quite distinct. When a water-closet on an upper floor is flushed the descending water drives the air in the pipe before it and draws air after it. On account of the friction of the air moving in the pipe and the difference of weight between the air and the water, the descending water tends to create a vacuum in the pipe and so rarifies the air above it. The water falling past the soil-pipe branches tends to draw the air out of those branches, and by reducing the air-pressure on the drain side of the traps it tends to allow the atmospheric pressure on the house side of the traps to displace the water—in ordinary language

For Drains.			For Soil and Ventilation Pipes.

is wanted, and extra current obtained by means of a cowl or an enlargement of the extremity of the pipe is undesirable. Either a cowl or the open end of the pipe will

to syphon the traps. The 2in. anti-syphonage pipe is to supply air in place of that drawn by the falling water instead of allowing air to be drawn through the traps. But if the 2in. pipe be connected to the upper part of the soil-pipe where the air is already rarified the good done by the 2in. pipe is partially nullified, and air is still liable to be drawn through the trap. If however the 2in. pipe be carried to the external air separately, the effect of the flushing of other closets than that to which it is connected is not felt.

The traps of all water-closets should be ventilated whether or not two or more are connected to the same soil-pipe or whether the trap is connected directly to the drain. When only one water-closet is fixed on a soil-pipe the trap may safely be ventilated into the soil-pipe.

The best size for soil-pipes is 3in. diameter. This is large enough for any practicable number of closets and not too large to be self-cleansing. Larger soil-pipes are often recommended and fixed on account of dangers from syphonage, but that is a matter to be guarded against by anti-syphonage pipes rather than by enlarged soil-pipes.

Soil-pipes should be fixed in straight lines whenever possible. When change of direction is necessary easy bends should be used rather than bends of 90deg. Each bend and junction should be fitted with access doors as in the case of the drain (Figs. 9 and 10). The metal faces and seats for these doors should be planed, so that a red-lead joint may be readily and neatly made. No permanent joint in connection with drainage

ordinances" require the anti-syphonage pipe connected to a water-closet trap to be of 2in. diameter for the first 40ft., 3in. diameter for the next 30ft., and 4in. diameter for the remainder of its length (Fig. 11). The trap ventilation-pipe has to be run up separately as high as the soil-pipe and not branched into the latter.

In the neighbouring city of Minneapolis the trap ventilation-pipe may be connected to the soil-pipe above the highest branch, but the soil-pipe must first be increased to 6in. diameter (Fig. 12). In both cities the anti-syphonage pipes must be increased in diameter according to the number of traps ventilated.

When the soil-pipe is at or near the head of the main drain or a branch drain, it will act as a ventilation-pipe for the drain. The main drain and all branch drains should be ventilated at or near their highest parts. All the drain-ventilation pipes (including the pipe to ventilate that portion of the drain between the intercepting trap and the sewer) should be carried a little higher than the ridge of the roof. When the drain on the sewer side of the intercepting trap is ventilated there is no fear of sewer-gas getting into the house-drain. With all the ventilation-pipes carried above the roof the pipes at each end will act indifferently as inlets or outlets depending on the direction of the wind and the flow of sewage flowing in the pipes. Under these circumstances a draught in any of the soil- or ventilation-pipes becomes a very trivial matter.

Inlets placed above but near the ground are liable to give off unpleasant smells in case of

ordinary mica flap-valve—but without the mica—makes as good an arrangement as any.

In the drainage of stables, cow-sheds and other buildings for the keeping of live stock the same rule as to the absence of openings to the drain should be followed as is applicable in the case of houses. The drainage should be effected by means of white-glazed stoneware channels set on a sufficiently thick bed of good concrete, jointed with cement, and covered with heavy galvanised-iron gratings. Such a channel should run along the rear of the stalls the full length of the house, with branches up the centre of the horse stalls for about one-third of their length. The channel should pass through the wall and discharge into a trapped gulley outside. The iron gratings are lifted and the channels cleaned out and sluiced down daily.

(To be continued.)

Law Cases.

A Disputed Contract.—At the Sussex Assizes recently the case of *Brockway v. Roberts* was heard, in which the plaintiff, a builder at Burgess Hill, brought an action against the defendant for damages for an alleged breach of contract. The plaintiff stated that on the invitation of Mr. C. T. Gillam, who was acting as architect in the matter for the defendant, he tendered for building alterations at Bolney Grange in May last, the amount of his tender, which was the lowest, being £1,620. The tender was accepted and the contract signed, nothing then

FIG. 7

FIG. 9

FIG. 10

FIG. 8

should be made with rubber, as drain air causes it to perish very quickly. In one drain which it was necessary to open a few weeks after it was laid a 9in. rubber washer which had dropped in accidentally was found to be too rotten to bear its own weight, and broke as a thin strip of putty would when lifted by the middle. With "faced" joints red-lead putty is the best packing to use. When the metal faces of the joint are unplanned, hemp or millboard can be added to compensate for the inequality.

The access doors on the soil-pipe are very useful when any article improperly passes the water-closet trap. I have had to break out a length of iron soil-pipe on account of a stoppage which could not be removed in any other manner, and have found a paint tin, supposed to have been put down by the decorators who were working in the house at the time. An access door on each of the two bends between which the tin was found would have saved much inconvenience and expense. It is quite impossible to account for the manner in which some objects pass the water-closet trap and then remain in the soil-pipe in spite of the weight caused by the accumulation of sewage above them.

The anti-syphonage pipe should be of the same material as the soil-pipe and of corresponding weight. Although a 2in. pipe is large enough to ventilate one water-closet trap, or perhaps two or three, it is not large enough to serve for an indefinite number, as is the English custom. Nor will a 2in. pipe be effective as an anti-syphonage pipe if it is too long. The friction of air in pipes is so great that when the 2in. pipe is, say, 50ft. long the trap is for all practical purposes unventilated, especially if there are any bends in the pipe.

In St. Paul, Minnesota, U.S.A., the "city

accident. In one case of a stopped drain, where the fresh-air inlet was the lowest opening on the drain the sewage poured out with each discharge of a water-closet. Mica flap inlet valves are nuisances of themselves; or rather, as one eminent sanitary engineer said, "They do no good, but they do no harm, because no one ever made one tight." One at least was made tight. It was fixed on the drain of a large house in London. When a water-closet on one of the upper floors was flushed the air driven forward by the falling water had no escape. It therefore became compressed and drove the water out of the trap of the servants' water-closet with such force as to strike the roof of the vault in which it was placed. The plumber was sent for and after sundry experiments removed the mica from the inlet valve. All went well for a fortnight until someone noticed that the mica was gone and forthwith complained of bad smells. The plumber was ordered to replace the mica. He did so and there was immediately a recurrence of the old complaint. He therefore cut off one corner of the mica, just enough to allow the escape of air so as not to force the trap, but not enough to be noticeable. Many more such troubles would occur if air-inlet valves were made air-tight.

Air-inlet valves are not used in America. In exceptional cases both inlet and outlet ventilation pipes are carried up as high as the roof, but in the majority of cases the fresh-air inlet pipes terminate above but near the ground and are unprovided with a valve of any kind. In some cases the pipes open under a grating in the footpath, as shown in Knight's "Annotated Model By-laws." Others can be seen in front gardens or in front areas, with a vent-cap over them (Fig. 13), an arrangement to keep dirt and foreign substances out of the pipe. The

being said about giving sureties. Some discussion followed on the advancing of £100, but eventually plaintiff was able to get an overdraft at the bank, and on June 10th he received the plans and specifications from Mr. Gillam. The next day the latter wrote to the plaintiff saying, "As you cannot find financial security for the job, the other tender will be accepted," and on June 15th sent a further letter informing him that under no circumstances would the contract be given to him. Plaintiff had had bills of quantities prepared, for which, as his tender was accepted, he was to pay 2 per cent. on the amount of the contract, and had engaged a foreman and made other preparations for the work. Had he been allowed to carry out the job he believed he would have made a profit of 15 per cent. Several architects were called as witnesses and they were agreed that the job should have yielded a profit of from 10 to 12 per cent. For the defence Mr. Gillam stated that on June 6th plaintiff signed the agreement but declined to sign the plans and specifications. It was essential, in witness's opinion, that he should have signed them to make the contract binding, because they were a part of it. After the interview with Mr. Maynard, a solicitor, witness told him he could not let him go on, but plaintiff said he could get other gentlemen to finance him and witness said he would draw up a fresh agreement. He did so, but as plaintiff did not find financial security witness advised defendant that the matter would have to drop through. It was a problematical job altogether, and plaintiff might have lost £200 or £300. A Brighton builder eventually carried out the work for £1,750 in addition to the extras, which, witness thought, did not amount to £100. Mr. Justice Grantham found for the plaintiff, and entered judgment in his favour for £120.

THE STRUCTURE OF CEMENTING MATERIALS.*

By W. CARRICK ANDERSON, M.A., D.Sc.,
Lecturer on Metallurgical Chemistry, University of Glasgow.

THERE are certain topics on which one is at times called to speak that present the possibility of making one's story fairly complete. Without assuming that science has reached finality on any single point, there may certainly be said to be matters on which a body of knowledge exists so full and rounded off as to afford a sufficient explanation of daily experience and practice. But there are other questions, and these often not of minor importance, regarding which one may put forward a great deal of information, both useful and painfully won, with the consciousness that it is yet impossible to focus it in such a way as to make out of it a satisfactory solution of the problem with which it deals.

It is with such an unfinished story that I now come before you, and I do so without apology or regret, because I believe that to a society like this, made up largely of practical men keenly interested in the daily solution of practical problems, the narrative will not be unprofitable or pointless, and may fill up a few open spaces in the information of some with material which has not yet found its way into manuals and text-books; and while I am on this point let me safeguard myself from misapprehension. I have not come here to offer any suggestion or guidance as to the use of limes or cements. There are doubtless those present whose practical experience in the working of these materials extends over a lengthy period and has brought them face to face with many points to which my limited practice is a stranger. But it is my business to keep myself apprised of what is being done on such chemical problems by skilled experimenters in different parts of the world, and it is chiefly of the work of these men with reference to this subject of cements that I wish to speak. During the last fourteen years a great deal of valuable research has been done. It is true that the problem of the constitution of the most important cements still remains unsolved, but the reason is the intricacy of the problem itself, and this very intricacy makes it all the more essential that we should gather up the loose ends and know exactly how we stand at the present time.

Cementing Material.

By a cementing material we understand any substance or mixture of substances capable of binding non-coherent matter into a firm, more or less compact whole. The class of such substances includes, at its widest, bodies of the most diverse kind. There are the glues and cements in use for domestic purposes; the various compositions employed for structural work in different connections; those which serve to bind the particles in composition bricks, firebricks, silica bricks, magnesite bricks, &c.; lastly, what we might call the natural cements, which, in the case of freestones and other quarried material, suffice to keep these in a firm coherent state, able to resist for an indefinite period the wasting effects of air and water.

The cementing materials of which I am going particularly to speak are those which are prepared artificially for the use of the builder and the engineer, and especially lime, gypsum, hydraulic limes, Roman, Portland and slag cements.

Forces that operate in the Employment of Cements.

When a body that is chemically homogeneous forms a solid compact mass, the particles are held together by a force which is known as "cohesion." When the solid is a mixture or aggregate of several substances the uniting force is known as "adhesion." In a mass of pure white Carrara marble, which is chemically carbonate of calcium, the particles are firmly united by cohesion. In a mass of granite in which there are usually three constituents chemically distinct, quartz, felspar and mica, we have an example of how powerful a force "adhesion"

may become under certain circumstances. These forces of cohesion and adhesion fix to a large extent the hardness of the material. Cohesion, operating between particles of the same kind, is obviously simple: adhesion is a more variable quantity, being the resultant of several factors. Whether they are in their ultimate essence the same and can be regarded as phases simply of the law of gravitation, we do not need now specially to consider. Certain it is that under suitable conditions they are forces that may become exceedingly powerful, that they become stronger the less the distance between the surfaces that are united, and that they may be regarded (other things being equal) as proportional to the area on which they act.

It is on the employment of these two forces of cohesion and adhesion that the practice of cementing rests. If the cement be a uniform, chemically simple substance, its particles are united to themselves by the force of cohesion; if it is a complexus of substances, cohesion and adhesion will operate conjointly; in either case the substances which are united by the cement are held together by adhesion.

Cohesion, Adhesion and Chemical Affinity.

Cohesion and adhesion are forces which act at distances inconceivably short. If we regard them as manifestations simply of the gravitational energy, which operates with a force which is inversely proportional to the square of the distance, we can readily understand how at excessively minute distances they may become the powerful influences which impart the hardness of granite or of basalt. But there is a force which acts at still shorter distances. This is chemical affinity, which comes into play, for example, when water is allowed to come into contact with a lump of quicklime. In this case the water and the quicklime have been united with a force against which such mechanical forces as tearing, twisting and crushing are powerless, and with an intimacy so close that no microscope can reveal any dividing line between the constituents.

Method of securing Contact.

In order to bring about the most intimate contact between two substances over a maximum area of surface it is necessary that one of them should be a fluid, so that its particles may work their way into the crevices and accommodate themselves to the irregularities of the other if it be a solid—hence the practice of making cementing materials into a paste with water or other suitable medium; while on the other hand since solids have a greater degree of rigidity and hardness than liquids it is imperative that this pasty condition shall not be a permanent one but that, by some subsequent process of hardening, a reversion into the state of solid shall take place.

With these prefatory remarks we may proceed to consider by what mechanism the desired result is brought about in the case of (1) lime, (2) plaster-of-Paris, (3) the class of cements which includes hydraulic limes, Roman, Portland and slag cements.

Lime.

The chemical nature of quicklime is well known. It is made up of a difficultly reducible metal calcium in union with oxygen. In practice it is got by calcination of naturally occurring carbonate of lime, which is found as marble, chalk, limestone, &c. At ordinary temperatures the union between the carbon dioxide, which forms the other constituent, and the lime is a strong one, but as the temperature is raised it is weakened so that at a little over 800° C. (1,472° F.) under ordinary atmospheric pressure it becomes nil. The carbon dioxide goes off and lime or quicklime remains.

Rich or Fat Lime.

Quicklime, when brought in contact with water, combines chemically with it, and the combination, as is well known, is accompanied by a large evolution of heat, amounting to 1,498 calories per gram of the quicklime. There is at the same time a remarkable expansion in bulk. The resulting hydrate may occupy three times the space filled by the original quicklime. The specific gravity of the original quicklime is 3.08 and of the water 1. The slaked lime formed contains 32 grains of water in combination with every 100 grains of quicklime.

100 grams quicklime occupy $\frac{100}{3.08} = 32.5$ c.cs.

32 " water " $\frac{32}{1} = 32$ c.cs.

Total volume occupied by these ingredients - - - = 64.5 c.cs.

Volume occupied by resulting slaked lime (say $2\frac{1}{2}$ times that of quicklime)
= $32.5 \times 2.5 = 81.25$ c.cs.

Original volume of ingredients, 64.5.

Increase of space occupied by 100 grams quicklime after slaking, 16.75 c.cs.

The specific gravity of slaked lime is 2.078, so that the 132 grams of resulting slaked lime occupy only $\frac{132}{2.078} = 63.5$ c.cs. with the actual

matter. Therefore there is an air-space of about 17 c.cs. between the particles.

The result of this is that the cohesive force, previously fairly strong between the particles of quicklime, must of necessity be greatly reduced by slaking. As a matter of fact we know it is reduced to nil, and the product is a loose non-coherent powder.

Hardening of Fat-lime Mortars.

When such fat lime is mixed with sand and water and used as mortar, in course of time the mixture dries and the remainder has little strength or uniting force among its grains. Assuming it to have become thoroughly dry, the only binding forces that hold it together may be considered to be the following:—

Atmospheric Carbon Dioxide.

On the outside the slaked lime fixes some carbon dioxide from the air (in which this gas is present normally to the extent of 3.5 parts in 10,000) and becomes converted into carbonate of lime, which forms a somewhat hard resistant skin or crust. But in the interior such change takes place with extreme slowness and can scarcely be reckoned as an effective agent at all.

Crystallisation of Lime.

Lime however is slightly soluble in water (13.5 parts of slaked lime in 10,000 of water at ordinary temperatures), and as the mixture of water, lime and sand dries up this dissolved lime crystallises out, filling up the interstices of the mass and so promoting adhesion between the separate constituents.

Chemical Action in Fat-lime Mortars.

Sand is frequently said to owe its employment in mortars solely to reasons of economy. But this is scarcely accurate: the superior hardness of the sand grains as compared with those of slaked lime confers strength, and besides the adhesive forces brought into play between the faces of the sand particles and the grains of slaked lime are undoubtedly greater than the cohesive force acting between the lime particles themselves. Over and above these, however, I believe there is another influence which ought not to be left out of account, namely the possibility of chemical action between the grains of sand and the lime brought into solution by the water. At one time it was confidently asserted that chemical action of this sort was largely the cause of the hardening of such mortars. Later it was shown experimentally that in mortars which had been taken from buildings hundreds of years old, and which were perfectly hard and strong, the amount of silicate of lime existing was extremely small, if indeed there was any. Such experimental results led to the abandonment of the view that silicate formation was responsible for the firming of these fat-lime mortars, with the result that the influences I have named above are now credited with the chief part, if not the whole, of the effect. Without denying that this is the case however, I would point out that according to our modern conceptions we can hardly regard the formation of silicate of calcium, at least in the form of an infinitesimally thin surface layer on the face of the sand grains, as non-existent. Such alkaline water as is present in a mixed-up mortar can hardly fail to have some slight superficial action on the sand grains. The amount of silica so influenced may be extremely small, and yet by means of it the adhesive forces may be (and probably are) really reinforced in a considerable degree.

* A paper read before the Scientific Society of the Glasgow and West of Scotland Technical College on February 22nd, 1902.

Gypsum.

Before proceeding to the more complex problems introduced in the employment of lime that is accompanied by other active substances, we may touch for a moment on the behaviour of a well-known substance, plaster-of-Paris.

Gypsum is a naturally occurring substance which has this in common with limestone—it is a compound of the same element, calcium. It differs from the other in containing sulphuric acid, we may say, in place of carbonic acid. As found in nature the stone has a composition that is represented by the chemical formula $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. By this is meant that every complete particle of the substance is built up of a particle of real calcium sulphate, CaSO_4 , in union with two particles of water H_2O . The union which exists between the two parts of this complex particle is not difficult to overcome. Gypsum by moderate heating can be made to part with the whole of the water which is attached to it, and there is left CaSO_4 . When this calcium sulphate CaSO_4 , containing no water in combination, has been prepared it may be placed in the midst of water and shows very little inclination to take up what it has lost. In course of time it does so, but the process is a very slow one. If however the gypsum be heated to temperatures short of that at which complete dehydration occurs (381°F . or 194°C .) its behaviour is somewhat different. It was shown in 1887 by H. Le Chatelier that when gypsum is subjected to the influence of heat it does not lose its combined water all at once, but by stages, and these stages correspond to definite temperatures. At 128°C . (262°F .) it parts with an amount equal to about 15.6 per cent. of its weight, and even when maintained at 155°C . (311°F .) for an hour afterwards the weight was found not to have diminished further. It still retained water equal to 5.2 per cent. of its weight. This remaining 5.2 per cent. it lost when kept at 194°C . (381°F .) for one hour. Afterwards on heating more strongly the weight remained constant. The meaning of these results is that at a temperature above 128°C . and not exceeding 155°C . (311°F .) the body having the chemical formula $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ changes to one having the formula $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ and at a temperature of 194°C . (381°F .) it becomes CaSO_4 .

When the substance has the composition represented by the formula $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ it readily resumes possession of the water it has lost when moistened, and passes back to the composition $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. This is the material called plaster-of-Paris, and, as is well known, in resuming the water previously parted with it sets into a firm mass, with considerable expansion. When the gypsum has been thoroughly deprived of the water it was combined with, it shows no such readiness to resume possession. The most probable explanation of this somewhat contrary behaviour is that when the $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ particle has parted with the water it contains at a temperature of 194°C ., the remaining CaSO_4 combines with itself to form particles which are more complex $(\text{CaSO}_4)_n$ and this union has to be broken before the water can re-enter the molecule. This is a slow and gradual process that can only be effected after a prolonged bombardment of the fortress by the water molecules. Hence "dead-burnt" gypsum only readmits water into union with it after the lapse of a period of time.

The Setting of Plaster-of-Paris.

Le Chatelier's experiments and views have also thrown light on the mechanism by which plaster-of-Paris when it recombines with water forms a firm coherent mass by "setting."

Le Chatelier recalled in this connection an interesting experiment of Marignac, an earlier French chemist. Marignac pointed out that if plaster-of-Paris is shaken with water and the liquid filtered after about five minutes, a solution is obtained which is five times as concentrated as the strongest that can be made from the fully-hydrated sulphate of calcium. But this solution soon after being filtered becomes turbid and deposits crystals of gypsum, so that the concentration in course of time becomes normal. Now this means that the solution which was saturated with the substance $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$ has more than it can carry when this body becomes $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, and crystallisation ensues. When plaster is mixed to a paste

with say 30 to 35 per cent. of its weight of water, this water will proceed to dissolve its complement of the body $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$. This in time hydrates itself to $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ and the water being then more than saturated deposits crystals. But since there is present a large excess of the plaster undissolved, the water is continually replenished with the body $2\text{CaSO}_4 \cdot \text{H}_2\text{O}$, which in turn becomes hydrated and forms crystals of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$.

The process (with a sufficiency of water) is a continuous one and goes on till the whole of the plaster has passed into the fully-hydrated condition. The result is a mass of crystals which interlace with one another and bind themselves into a fairly firm solid body.

Keene's Cement and Parian Cement.

Regarding the structure and behaviour of the special plaster cements known by such names as "Keene's" and "Parian" I do not dwell, for the reason that while theories have been advanced to explain their action, these do not yet, I believe, rest on a sufficiently sound experimental basis to make it worth our while to spend time on them just now.

Keene's cement is made by steeping the calcined gypsum in a strong solution of borax and cream of tartar (1 part borax and 1 part cream of tartar in 18 parts of water). When it has become thoroughly impregnated, it is taken out, dried and reburnt at a temperature of dull redness for six to eight hours. Borax alone is said to give equally good results, and the stronger the solution the slower the ultimate set.

For Parian cement an intimate mixture of gypsum and dried borax is calcined and afterwards finely ground.

Hydraulic Cementing Materials.

This class of substances is made up of those which will set and harden even in the midst of water. It includes the hydraulic limes, Roman cement, Portland and slag cements.

All limestones are not composed of calcium carbonate in a state of even approximate purity. As a rule they contain more or less clayey matter associated with the carbonate, and in some limestones this is present in considerable quantity. Such clayey matter when present will not be without effect in the calcining process. We have seen that when pure calcium carbonate is heated to a high enough temperature pure calcium oxide or quicklime is left.

In chemical composition clay is a complex body. It is made up of an acid part, silicic acid, and this is combined with alumina and with lime, magnesia and potash, singly or collectively. Two bases are usually present, of which alumina is one. Alumina, the oxide from which aluminium is prepared, is a body of an interesting character. Perhaps its most important feature is its versatility. According to circumstances it will play the part either of a base or of an acid. It is always apparently sitting on the fence: if no other base is present it is ready to act as a base; if a strong active base makes its appearance, alumina is quite ready to discharge the functions of an acid towards it. Keeping this in view we can imagine what will happen when clay which is present in a limestone is subjected along with the accompanying calcium carbonate to the calcining process. At a certain temperature the carbon dioxide of the limestone begins to go off, and this result is stimulated by the co-operation of the silicic acid present, so that it usually takes place at a lower temperature than is the case with a pure limestone. The quicklime being a more powerful base at once begins to oust the alumina from its combination with the silicic acid and silicates of lime are formed. The alumina then, not liking its position of "splendid isolation" and having no acid to ally itself with, combines with the calcium oxide to form aluminates of calcium in which it behaves as an acid. There are several silicates of calcium capable of being formed, and there are also several aluminates of calcium with different proportions of the base in them; consequently we can understand that variation in the amount of clay, and even variation of temperature, may give rise to different products and so to difference in behaviour on the part of the resulting material. To ensure complete union between lime and silicic acid a very high temperature is required, and the same holds true of the formation of aluminates. Temperatures short of this

will produce intermediate products. If the amount of clay is small in proportion to the lime, a balance of the latter will remain uncombined with silicic acid and alumina, and on treatment with water will slake in the ordinary way. Low-temperature calcination generally produces quick setting.

Application of Principles to Hydraulic Limes.

The hydraulic limes are natural limestones in which more or less clayey matter is present. If the percentage of clay is from 5 to 10 per cent the material after calcination at a moderate temperature still slakes strongly after a few minutes: with 15 to 20 per cent. of clay the slaking takes place gently and after a lapse of time; with 20 to 30 per cent. of clay slaking is slight and only after a long period. If burned at a higher temperature, up to the point at which there is incipient vitrification, the masses will not readily undergo change on contact with water. They are then said to be "overburnt" or "clinkered." A good hydraulic lime would be produced by calcining at a moderate temperature a clayey limestone in which the calcium carbonate is present to the extent of from 72 to 92 per cent. Artificial mixtures of limestone and clay containing these proportions are also hydraulic when calcined at a similar temperature. Fine grinding of such hydraulic limes will enable the slaking and setting to go on simultaneously, instead of the former being continued after the latter has already conferred a degree of rigidity on the mass, with consequent straining and perhaps rupture of the whole.

Roman Cement.

This substance, which at one time was largely made in this country, was got by calcining nodules of a limey clay occurring in the London clay. As a rule they contain from 30 to 40 per cent. of clayey matter and are usually highly ferruginous. It was also manufactured (and still is to some extent in the neighbourhood of Glasgow) from clayey limestones belonging to the carboniferous formation. Calcined at a low temperature, not sufficient to completely expel all the carbon dioxide, and then finely ground, the material sets very rapidly with water to form a hard mass of moderate strength. If the temperature of the kiln be not very carefully regulated such highly argillaceous mixtures are apt to fuse readily and then give a very slow-setting product. This is particularly the case when much iron is present.

Composition of Boulogne Cement.

	Per cent.
Silica -	14.27
Alumina -	5.81
Iron -	5.97
Magnesia -	.67
Manganese -	.83
Lime -	46.20
Loss of calcination (H_2O and CO_2) -	26.25
	100.00

Summary.

From the behaviour of hydraulic limes and Roman cements we learn that—

- (1) If the proportion of clay is low and the degree of temperature moderate, the result will be an hydraulic lime, the lumps of which are capable of slaking and will then go through a process of hardening. They never become very strong.
- (2) If the proportion of clay is low and strong heating is applied, no slaking will take place when the calcined stone is placed in water. It is "overburnt." After being finely powdered it would gradually undergo setting. Later, a part of the lime might undergo slaking, leading to disruption or "blowing."
- (3) If the proportion of clay is high and the heating is moderate, then on grinding the mass a rapid setting will take place, as is seen in the so-called Roman cements. If the temperature of calcining is high, a mixture of quicklime and cement, or a slow-setting cement alone, may be produced. Where, as is frequently the case in natural stones containing a high percentage of clay, iron is in large proportion, fusing readily takes place and the resulting glass reacts very slowly with water.

Portland Cement.

Experience in the working of the substances already mentioned led in time to the endeavour

to prepare suitable artificial mixtures of lime and clay and firing these to the proper temperature. This stage in the history of cements was reached in 1824 when Aspdin of Leeds patented his method for an "Improvement in the modes of producing an artificial stone." In it we see the outline of the present-day process of making Portland cements, for he takes powdered limestone and "a specific quantity of argillaceous earth or clay" and mixes them to an impalpable paste with water, dries this in a pan, and calcines, afterwards grinding to a fine powder.

Examples of materials used to-day (Butler):—

Medway Chalk.		Medway Mud.		Cement.	
	Per cent.		Per cent.		Per cent.
Loss at 212° F.	40	Water	4.30	Loss at 212°	20

In modern practice the mixture of chalk and mud is calcined to the point of incipient fusion. Experience in the manufacture and use of Portland cements has in course of time fixed upon a very definite proportion of the three principal ingredients, lime, silica and alumina, as that which will give the strongest, most reliable and most durable cements. The lime varies between 61 and 65 per cent. as a rule; the silica is nearly always over 20 per cent., and the average is about 21 per cent.; alumina is usually between 6 and 7 per cent., with a variable quantity of oxide of iron, which, reckoned as alumina, might bring it up to about 11 per cent. Increase or decrease in the proportion of the alumina and iron, other things being the same, usually results in increased or diminished rapidity of setting (see analyses to be published next week).

Slag Cements.

The ingredients necessary in the cements we have mentioned, hydraulic limes, Roman cement and Portland cement, are in kind the same as go to make up ordinary blast-furnace slags, namely, lime, alumina and silica; except that as a rule the proportion of lime in these latter is less than in the Portland cements. Thus an ordinary Scotch blast furnace slag might have the proportions—

	Per cent.
Silica	30
Alumina	20
Lime	38
Magnesia, iron oxide, &c.	12
	100

Some blast-furnace slags are however considerably richer in lime, and many of these if run molten into water and so granulated are found afterwards to possess notable hydraulic properties. In other cases the "slag sand" produced in this way is mixed intimately with lime, say in the proportions 3 of slag to 1 of lime, and the result is a cement of very good quality and strength.

The following figures show the composition of a German slag cement ("Königshofer")—

Slag used.		Lime (ignited).		Finished Cement (Tetmajer).

100.66

In connection with its chemical composition we have to keep in remembrance the fact that it has been subjected to a temperature sufficient to bring about complete fusion, and that when liquid it is run direct into water and so suddenly chilled. Portland-cement clinker has only, as we have seen, been raised to a temperature sufficient to bring about sintering.

Structure of these Cements.

We are now in a position to study the researches which have been conducted during recent years with a view to throwing some light upon the structure and behaviour of these bodies.

The first to make a real advance in this direction was Le Chatelier, who in 1887 published an elaborate paper on the subject. His method was a twofold one, microscopical examination of the Portland-cement clinker and set cement, and synthetic preparation of the bodies supposed to constitute these, with a view to studying their properties.

Le Chatelier's Investigations.

Cement clinker he finds is a composite substance, and in thin sections is seen to be made up of constituents some of which are active and others inactive to polarised light. To separate them from one another appeared to be impossible, hence he was led to try to construct bodies of like physical and chemical behaviour out of the elements which are contained in the clinker.

(1) A proportion of the clinker is inactive to polarised light. The substance having the formula $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ crystallises in cubes he finds, and hence is optically inactive.

(2) A second substance which is present has weak optical activity with well-defined crystalline form. It is the chief constituent of Portland cement, and he believes it is a silicate of lime with the formula $3\text{CaO} \cdot \text{SiO}_2$.

(3) This silicate is crystallised in a matrix of a deep-brown colour which is optically active, and more fusible than either of the previous ones. This Le Chatelier conjectures may be an aluminoferrite of lime with the formula $2(\text{AlFe})_2\text{O}_3 \cdot 3\text{CaO}$. He was able to produce

on to examine these with particular reference to their action on water.

Aluminates.

Mono-aluminate.— $\text{CaO} \cdot \text{Al}_2\text{O}_3$; nearly infusible; sets rapidly with water.

Di-aluminate.— $2\text{CaO} \cdot \text{Al}_2\text{O}_3$; rather fusible; sets quickly with water like plaster, but the mass afterwards falls to pieces on boiling with water.

Tri-aluminate.— $3\text{CaO} \cdot \text{Al}_2\text{O}_3$; very fusible and sets quickly with water.

Silicates.

Mono-silicate.— $\text{CaO} \cdot \text{SiO}_2$; is not acted on by water and therefore can play no part in the hardening of cement.

Di-silicate.— $2\text{CaO} \cdot \text{SiO}_2$; is formed by heating chalk and powdered quartz in the right proportions in a crucible; it falls to pieces on cooling, like overlaid cement clinker. This spontaneous pulverisation is due, Le Chatelier believes, to a change in crystalline form.

Tri-silicate.— $3\text{CaO} \cdot \text{SiO}_2$; cannot be got by heating silica with 3 molecules of lime, a mixture of lime and lower silicates being always obtained. Le Chatelier believes however that this tri-silicate may be formed indirectly by heating lime and fusible silicates and is the chief active constituent of hydraulic mortars.

On the assumption that the tri-aluminate and tri-silicate of lime are the chief constituents in cement clinker, Le Chatelier formulates the rule that in the mixture to be calcined for cement making, the proportion between bases, represented by lime and magnesia, and acids, represented by silica and alumina (and iron oxide), should stand thus—

Composition of Set Cement (Le Chatelier).

In the set cement, according to Le Chatelier, the structure is made up of hexagonal plates of white crystallized calcium hydrate, $\text{Ca}(\text{OH})_2$, embedded in a white mass of interlaced needle-shaped crystals of a hydrated calcium mono-silicate having the formula $\text{CaSiO}_3 \cdot 2\frac{1}{2}\text{H}_2\text{O}$. The chief reaction might thus be represented—

Investigations of Messrs. Newberry.

These researches of Le Chatelier were followed up and extended by Messrs. S. B. & W. B. Newberry, of New York, who published their results in 1897.

The points on which they specially sought information were—(1) What proportion of lime must be employed for given percentages of silica and alumina in a clay? (2) Can a general formula be stated, applicable to all clays, which will indicate the proportion of lime to give the best result with each?

As a preliminary step to answering these questions Messrs. Newberry repeated Le Chatelier's experiments of making and examining the pure silicates and aluminates of lime with the results as described on the next page.

Conclusions.

From these results Messrs. Newberry draw the following conclusions:—

(1) Lime may be combined with silica in the proportion of 3 molecules to 1 and still give a product of practically constant volume and good hardening properties, though hardening very slowly. With $3\frac{1}{2}$ molecules of lime to 1 of silica the product is not sound, and cracks in water.

(2) Lime may be combined with alumina in the proportion of 2 molecules to 1, giving a product which sets quickly but shows constant volume and good hardening properties. With $2\frac{1}{2}$ molecules of lime to 1 of alumina the product is not sound.

Application of these Results.

The data thus obtained, it is suggested, may be made use of to gauge the amount of lime that may be safely used with a clay of any known composition. The most basic silicate of lime that can exist in a good clinker being that which has the formula $3\text{CaO} \cdot \text{SiO}_2$, and the most basic aluminate being $2\text{CaO} \cdot \text{Al}_2\text{O}_3$, the most highly limed clinker will have the general formula

such a body with the required properties. It is slowly acted on by water, and does not contribute much to the setting power of the cement.

Proceeding on the assumption that aluminates and silicates of lime constitute the principal constituents of Portland cement, Le Chatelier went

Silicates.

	Formula.	Ratio $\frac{\text{CaO}}{\text{SiO}_2}$	Per cent. CaO.	Per cent. SiO ₂ .	Pat Test.	Hot Test. ²
1	2CaO . SiO ₂ -	1.83	65.11	34.89	Set hard; hard at seven days; hard at six weeks.	Sound; on glass; hard.
2	2½CaO . SiO ₂ -	2.33	70.00	30.00	Set soft; fair at seven days; hard at six weeks.	Ditto.
3	3CaO . SiO ₂ -	2.80	73.63	26.32	Same as 2 - -	Ditto.
4	3½CaO . SiO ₂ -	3.27	76.56	23.44	Cracked; soft; hard at six weeks.	Ditto.

Aluminates.

	Formula.	Ratio $\frac{\text{CaO}}{\text{Al}_2\text{O}_3}$	Per cent. CaO.	Per cent. Al ₂ O ₃ .	Pat Test.	Hot Test.
1	2CaO . Al ₂ O ₃ -	1.10	52.33	47.62	Set quick; hard; sound at six weeks.	Sound; on glass; fairly hard.
2	2½CaO . Al ₂ O ₃ -	1.37	57.85	42.15	Set quick, curved and cracked.	Curved and cracked; soft.
3	3CaO . Al ₂ O ₃ -	1.65	62.23	37.77	Ditto - - -	Ditto.

² The pairs after testing overnight were exposed for four to five hours to steam at 90° C.

X (3CaO . SiO₂) + Y (2CaO . Al₂O₃), X and Y being the numbers of molecules of silicate and aluminate respectively.

In 3CaO . SiO₂ the ratio of lime to silicate is 2.8 : 1.

In 2CaO . Al₂O₃ the ratio of lime to alumina is 1.1 : 1.

therefore for 100 parts of clay the lime required will be—Per cent. of silica × 2.8 + per cent of alumina × 1.1.

It is to be noted however that the result so obtained is the theoretical maximum, only safe in practice with the very finest grinding of the clinker.

Oxide of Iron in Portland Cements.

To the question, what part is played by ferric oxide in the setting of cements, Messrs. Newberry's experiments lead them to give the answer that it is able to replace alumina and take its part in promoting the reaction between silica and lime.

Alkalis.

These experimenters conclude on the other hand that alkalis have no important part to play in the formation of cements.

Magnesia.

This element, which has been for long the centre of controversy among workers in cements, possesses hydraulic properties when heated alone. According to Messrs. Newberry it does not form hydraulic compounds with silica, alumina or clay. It is incapable of replacing lime in cement mixtures.

The carefully conducted researches of Messrs. Newberry mark a distinct advance in the chemistry of hydraulic cements, and we may take the limits which they suggest as really representing the maximum of lime which it is in practical work dangerous to approach and probably fatal to overstep.

O. Rebuffat.

In 1899 a well-known Italian expert on the chemistry of cements put forward his views on the structural arrangement of these materials, which may be summarised shortly thus:—

Hydraulic cements are divisible into two groups—(1) Non-crystalline, compact cements such as hydraulic limes and quick-setting (Roman) cements. These are composed of orthosilicate of calcium Ca_2SiO_4 and calcium aluminate, with lime in addition in certain cases. (2) Crystalline cements, such as Portland and silicious cements. These are composed of a crystalline compound of lime and orthosilicate of calcium and an aluminate of calcium in varying proportions. The aluminate is usually mono-aluminate; he believes in opposition to Le Chatelier's conclusion that it is the tri-compound $3\text{CaO} \cdot \text{Al}_2\text{O}_3$, a body which however, as we have seen, Messrs. Newberry hold is unsound in water. Along with the orthosilicate and lime compound, there is present also in cements high in silica a quantity of the calcium metasilicate $\text{CaO} \cdot \text{SiO}_2$.

The Setting Process according to Rebuffat.

The chemistry of the hardening process, according to Rebuffat, consists simply in the hydration of the calcium orthosilicate with production of a body having the composition represented by the formula $2(\text{SiO}_2 \cdot 2\text{CaO}) \cdot \text{H}_2\text{O}$. Hydration of the calcium aluminate takes place at the same time. The calcium oxide in combination with the calcium orthosilicate is set free in the hydration process, and forms calcium hydrate which crystallises. The metasilicate, which is present in highly silicious cements, does not hydrate, but enters into combination with the calcium aluminate, forming double compounds with it (double silicates of calcium and aluminium). To this latter combination Rebuffat ascribes the superior power which such highly silicious cements undoubtedly have to resist the action of sea-water.

Zulkowski.

On this part of my subject I shall refer to the work of only one more investigator, K. Zulkowski, published in 1899 and last year. Zulkowski lays stress upon a fact which previous writers have usually overlooked or regarded as of minor importance. We have seen that in the modern industry of slag-cement making it is found necessary to rapidly cool the molten slag by granulating in cold water. If the slag be not quickly chilled it will be found deficient in hydraulic properties, and may even be altogether devoid of them. If slowly cooled, such a slag will frequently fall to a loose grey powder. A similar phenomenon is not unknown in the Portland-cement works, and is called the "dusting" of cement clinker. Such changes, resulting in a difference of property, obviously proceed from some alteration of structure in the material, seeing that the chemical composition remains the same, and may be ascribed to dimorphism of some compound or compounds in the slag or clinker. In his latest paper (Chem. Ind., 1901, 21 [10] 290, &c.) Zulkowski expresses the view, based on a long series of experiments, that this dimorphism is manifested by the silicates of calcium of the general formula Ca_2SiO_4 . When two molecules of lime and one of silica are heated together, the orthosilicate is first formed. It would have the structure

According to Le Chatelier

" " Newberry

" " Rebuffat

" " Zulkowski

$\text{SiO}_2 \cdot 3\text{CaO}$
(tri-calcium silicate)

$\text{SiO}_2 \cdot 3\text{CaO}$
(tri-calcium silicate)

$\text{SiO}_2 \cdot 2\text{CaO} + \text{nCaO}$
(crystalline compd. of calcium orthosilicate and lime)

$\text{SiO}_2 \cdot 2\text{CaO} \text{ \& \; CaO in excess}$
(basic calcium metasilicate and lime)

and

$\text{Al}_2\text{O}_3 \cdot 3\text{CaO}$
(tri-calcium aluminate).

and

$\text{Al}_2\text{O}_3 \cdot 2\text{CaO}$
(di-calcium aluminate).

and

$\text{Al}_2\text{O}_3 \cdot \text{CaO}$
(calcium mono-aluminate).

and

$\text{Al}_2\text{O}_3 \cdot 2\text{CaO}$
(dicalcium aluminate).

namely, that at which the mixture melts or even softens, this body rearranges itself to form

basic calcium metasilicate $\text{O}=\text{Si} \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \text{O}$.

This basic calcium metasilicate is a powerful hydraulic. If the pasty or fluid mass be chilled by pouring suddenly into cold water (granulation) it remains, and the product is hydraulic. If, on the other hand, the cooling process is a gradual one, the basic metasilicate changes once more into the orthosilicate, which is without action as a cement. The orthosilicate is crystalline and the strains resulting from the crystallisation of the substance as it is formed cause the disintegration of the whole mass. This powdery material is found to be destitute of any hydraulic quality whatsoever.

The Setting Process according to Zulkowski.

When the basic metasilicate, according to this experimenter, is brought in contact with water it undergoes decomposition with formation of monocalcium silicate and calcium hydrate, thus—

In the alkaline liquid so produced the monosilicate swells up, and the increase of volume causes the binding to take place.

Composition and Structure of Portland-Cement Clinker according to Zulkowski.

Portland cement, in which, according to Le Chatelier, the principal constituent is tricalcium silicate, $3\text{CaO} \cdot \text{SiO}_2$, Zulkowski holds to be mainly composed of a mixture of dicalcium orthosilicate $\text{Ca} \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \text{Si} \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \text{Ca}$ basic calcium meta-

silicate $\text{O}=\text{Si} \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \text{O}$ and free lime CaO .

The tricalcium silicate of Le Chatelier he believes to be non-existent.

In support of his theories regarding the structure and setting of Portland cement, Zulkowski experimented on a sample from Stettin. From the analysis he was led to assume for the body the following composition:—

	Per cent.
Sodium silicate (with some potassium silicate) - - - -	3.43
Calcium sulphate - - - -	2.45
$\text{SiO}_2 \cdot 2\text{CaO}$ - - - -	61.89
$\text{Al}_2\text{O}_3 \cdot 2\text{CaO}$ - - - -	12.14
$\text{Fe}_2\text{O}_3 \cdot 2\text{CaO}$ - - - -	4.35
MgO - - - -	.97
CaO - - - -	14.22
	99.45

According to the author's views such a cement ought to fix 14.67 per cent. of water of hydration. The experimental results obtained were—

	Per cent.
In one day - - - -	4.30
" two days - - - -	6.47
" seven days - - - -	11.32
" twenty-one days - - - -	14.44
" thirty days - - - -	14.44

Summary.

Comparing the views of the authorities we have named, and whom I have taken as far as possible in chronological order, we find the following state of matters.

Portland-cement clinker is composed, according to all of them, of silicate and aluminate of calcium chiefly. The composition of these bodies is represented by the formulae below.

Put alongside one another, the views represented are not so divergent as would appear at

first sight to be the case. They all indicate that lime is present in excess of that required to form $\text{SiO}_2 \cdot \text{CaO}$. The earlier experimenters, Le Chatelier and Newberry, regarded that excess as being in combination, giving tri-calcium silicate. Rebuffat looks upon it as in the condition of a loose compound with $\text{SiO}_2 \cdot 2\text{CaO}$, capable of being decomposed by water. Zulkowski regards the excess as actually free lime in variable quantity. This latter view is probably the correct one; unfortunately there is as yet no reliable means at our disposal for differentiating between this really free lime and that existing as an unstable basic compound of silica. The substance $\text{SiO}_2 \cdot 2\text{CaO}$, which is active, Zulkowski calls basic calcium metasilicate, and is able to explain by its dimorphism with the calcium ortho-disilicate the results which follow from the granulation of slag cement and the "dusting" of Portland clinker.

With regard to the formula for the aluminate, the balance of evidence appears to be in favour of that given both by Newberry and Zulkowski, $\text{Al}_2\text{O}_3 \cdot 2\text{CaO}$.

Set Cement.

Regarding the composition of the set cement we have the views of Le Chatelier, Rebuffat and Zulkowski. According to the first and third the set cement has as its chief constituents calcium monosilicate, calcium hydrate and calcium aluminate. According to the one the monosilicate is hydrated ($2\{\text{CaO} \cdot \text{SiO}_2 \cdot 2\frac{1}{2}\text{H}_2\text{O}\}$), according to the other no water is combined with it. Rebuffat views the principal part of the set cement as hydrated calcium orthosilicate $2(\text{SiO}_2 \cdot 2\text{CaO})\text{H}_2\text{O}$.

Effect of Gypsum on Hydraulic Cements.

Before concluding this sketch of the chemistry of hydraulic cements I must deal shortly with the questions that arise in connection with the addition of calcium sulphate to such cements and the effect upon them of waters containing this substance in solution. The discovery that important results follow from the addition of plaster-of-Paris to hydraulic cements dates back to 1854, when the matter was investigated by General Scott, who, two years later, patented his selenitic cement in which 5 per cent. of plaster-of-Paris was intimately mixed with calcined hydraulic lime. One of the most important effects of adding calcium sulphate is to delay the setting of the cement. One per cent. of plaster-of-Paris thus intermixed has been found to delay the time of setting from five to seven hours. In consequence of this, gypsum is now largely used in quantities up to about 2 per cent. for the purpose of regulating the time of setting to any desired length. The experiments of Dyckerhoff, too, show that there is an appreciable gain in strength when from $\frac{1}{2}$ to 2 per cent. of gypsum is added to the cement. Lightly-burned cements are much more powerfully influenced by such additions than heavily-burned cement, which needs a larger addition of gypsum to effect the same result. Another point of interest is that a cement which has been made slow-setting by addition of gypsum can again be made quick-setting by aeration.

Candlot's Experiments.

In connection with the selenitic action Candlot has made some experiments of great interest. He found that when a cement to which gypsum has been added is gauged with water, calcium sulphate is found at first in the water with only a little free lime. After three hours the free lime in solution has increased and the gypsum has fallen to nil. From these results Candlot concluded that something in the setting cement was forming an insoluble compound with the gypsum. He then found that calcium aluminate of the formula $\text{Al}_2\text{O}_3 \cdot 5\text{CaO}$ behaved in the same way towards gypsum as the cement did, and thereafter he succeeded in isolating a crystalline compound formed by the two and having a composition corresponding to the formula $\text{Al}_2\text{O}_3 \cdot 3\text{CaO} \cdot 2\frac{1}{2}\text{CaSO}_4 \cdot 6\frac{1}{2}\text{H}_2\text{O}$. This body is difficultly soluble in water and insoluble in lime water. The formation of this body according to Candlot explains why it is that a cement which has been rendered slow-setting by gypsum regains its quick-setting property on aeration. All cements contain a small quantity of free lime. This dissolves in the water used for gauging, and in the lime water so formed the calcium aluminate is insoluble. The calcium

sulphate also dissolves and further decreases the solubility of the aluminate. By aeration the free lime is converted into carbonate; then on gauging the aluminate and the gypsum dissolve together and react with mutual precipitation and so the setting takes place rapidly.

If the free lime in a cement containing no calcium sulphate be removed by gauging with a weak solution of sodium carbonate (0.2 per cent.), the setting time may be reduced from two hours to three minutes. Conversely a gypseous cement that has become quick-setting by aeration may again be made slow-setting by addition of a little lime. With Portland cements the formation of the double compound may not become complete during setting and the result may be "blowing" if much gypsum is present.

Michaëlis.

Michaëlis has described a body similar to that made by Candlot under the title of the "cement bacillus" to which he gives the formula $\text{Al}_2\text{O}_3 \cdot 3\text{CaO} \cdot 3\text{CaSO}_4 \cdot 30\text{H}_2\text{O}$.

This body occupies a much larger space than the aluminate and sulphate which enter into its composition and hence, when formed in quantity, owing to much gypsum being present, it causes "blowing." The greater bulk it occupies explains however why it is that a limited addition of calcium sulphate gives increased closeness of texture and greater tensile strength to a cement.

F. Schott.

These conclusions are largely borne out by the experiments of Schott, of which the following may be quoted. Two cements, which we shall call "A" and "B," were prepared. "A" consisted solely of lime and silica in the proportions necessary to form the compound $\text{SiO}_2 \cdot 2\text{CaO}$. "B" contained alumina to an extent similar to an ordinary commercial cement. Its percentage composition was—Silica 18.09; alumina 12.53; ferric oxide .90; lime 63.30; magnesia .96; sulphuric anhydride .71; loss on ignition 3.73; total = 100.22. Samples of these cements were gauged with water both with and without addition of gypsum. The quantity of gypsum added was reckoned so as to form the double compound $\text{Al}_2\text{O}_3 \cdot 3\text{CaO} \cdot 3\text{CaSO}_4 \cdot 30\text{H}_2\text{O}$ of Michaëlis, with the whole of the aluminate present. "A" set firmly under both sets of conditions and with practically no expansion. "B" when gauged with pure water showed the usual expansion of Portland cements, and when treated with gypsum expanded violently and broke up. A cement prepared according to the formula $2\text{CaO} \cdot \text{Al}_2\text{O}_3$ when gauged alone expanded considerably, and when gypsum was added showed a still stronger expansion, resulting in cracking without disintegration. Another cement in which ferric oxide was made to replace alumina, and having the composition—

	Per cent.
Silica - - - - -	26.10
Ferric oxide - - -	12.90
Lime - - - - -	61.60
	99.9

hardened perfectly without blowing when gauged alone, but on addition of gypsum showed strong expansion. Gypsum would thus appear to exert a similar influence on calcium ferrite to what it has on calcium aluminate.

Klinkenburg.

Klinkenburg has confirmed the statements of Candlot and Michaëlis, that calcium sulphate combines with the aluminates of lime to form compounds containing a very large proportion of combined water.

Effect of Sea-Water on Portland Cement Explained.

According to Michaëlis (Proceedings Institute of Civil Engineers 1896-7) the formation of this calcium aluminate-sulphate takes place very freely when Portland-cement mortar hardens in sea-water. When Portland cements are passing through the hardening process they undergo decomposition with separation of calcium hydrate, which crystallises throughout the mass. When the hardening takes place in sea-water the excess of lime is converted into sulphate and ultimately into silicate. The sulphate of calcium thus formed combines with the calcium aluminate and assimilates from thirty to sixty equivalents of water with such increase in bulk as to seriously affect the cohesion of the mass. Roman cements, according to this authority, on account of their having a smaller proportion of lime, form under these conditions

more stable compounds, and from a chemical point of view constitute the best hydraulic mortars. A smaller amount of the double salt is formed, and it finds enough room for expansion in the pores of the mortar. Being burnt at a low temperature, however, these cements are deficient in density, and mortars made from them shrink on exposure to air.

Protection afforded by Addition of Trass.

To Portlands from which about 33 per cent. of calcium hydrate would be segregated Michaëlis advises the addition of trass or similar substances rich in silica (say 125 parts of trass to 100 of Portland) which would combine gradually with the free lime and so render the mortar more stable in sea-water.

M. Deval on the preparation of Sulpho-Aluminate.

The most recent experimenter on the sulpho-aluminate of calcium is M. Deval, and his results, published in 1900 (Bull. de la Soc. d'Encour., 1900, 5 [1], 49-54), have still further defined the nature and composition of the body. He has shown that it can be prepared from sulphate of alumina and calcium hydrate, and also from tri-calcium aluminate and sulphate of lime. The resulting body had the same composition in each case, and this agreed with the formula $\text{Al}_2\text{O}_3 \cdot 3\text{CaO} \cdot 3\text{CaSO}_4 \cdot 28\frac{1}{2}\text{H}_2\text{O}$, which is in close agreement with that given by Michaëlis.

Summary.

I shall now attempt to sum up the position in which I believe we at present stand in relation to the chemistry of these hydraulic cements.

(1) Investigation has been chiefly directed to the class of Portland and slag cements, that is to say, those in which the raw materials have been heated to the point of incipient or actual fusion. Such cements, as well as the hydraulic limes and Roman cement, consist almost certainly of silicates and aluminates of calcium with, in many cases at least, some excess of lime.

(2) The silicate of calcium, which is the predominating constituent in Portland and slag cements, has the general formula Ca_2SiO_4 . An excess of lime, which is present, at least in all Portland cements, exists either free (Zulkowski) or in loose combination with the silicate (Rebuffat). Two compounds exist corresponding to this general formula, only one of which has hydraulic properties. To it Zulkowski gives the structural formula

and the name basic calcium metasilicate. The other he regards as the orthosilicate with the structural formula

(3) The aluminate is either the mono- or di-aluminate of calcium, most probably the latter.

(4) In the setting process the excess lime, whether it is free or in a state of loose combination, slakes, dissolves in the water and crystallises. The basic metasilicate also decomposes with separation of lime, which likewise hydrates (Zulkowski); mono-calcium silicate is at the same time formed and takes part in the setting process, either by hydrating with $2\frac{1}{2}$ molecules of water (Le Chatelier) or by simply swelling up in the alkaline liquid (Zulkowski). The di-calcium aluminate may become hydrated at the same time.

(5) The set cement is mainly composed of calcium hydrate crystals, calcium monosilicate (hydrated or anhydrous) and mono- or di-calcium aluminate, probably also in the hydrated condition. Any ferric oxide present plays the part of its equivalent of alumina.

(6) Various substances dissolved in the water used for gauging have a marked effect on the setting process. Lime and calcium sulphate delay the setting; sodium carbonate, calcium chloride, and magnesium chloride hasten it.

Of the substances mentioned, calcium sulphate has in addition the remarkable property of forming a compound

with the aluminate present. This compound occupies a much larger bulk than the gypsum and aluminate which enter into its composition, and if formed in quantity in a cement may lead to a serious weakening of its cohesion and even cause destruction of the whole mass.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BRISTOL.—For the enlargement of the Petty Sessional Courts and Offices in Bridewell Street, Bristol, for the Corporation. Mr. Henry Williams, architect:—
 Stephens & Bastow... £20,880 C. A. Haynes... £19,707
 J. Perkins... 20,070 E. Walters... 19,070
 W. Cowlin & Son... 20,493 R. F. Hidd... 19,590
 A. J. Beavan... 19,900 R. Wilkins & Sons... 18,117
 * Accepted.

CHATHAM.—For extension of St. William's Hospital, and for building a new ward to the small-pox hospital, for the Rochester and Chatham Joint Hospital Board:—
 Viney & Stone... £13,037 Lawrence Seager... £11,290
 J. H. Durrant... 12,990 West Bros... 11,110
 Wallis & Sons... 12,350 H. Phillips... 10,745
 Multon & Wallis... 12,350 C. E. Skinner... 9,350
 W. Coker... 11,478 J. D. Corke... 9,900
 George West... 11,380 * Accepted.

CHISWICK.—Accepted for extension of Carriage Factory, Chiswick, W., for Messrs. Henry Whitlock, Ltd. Mr. T. Wilson, architect, 34 New Bridge Street, E.C.:—
 L. L. Leeder & Co... £1,397

CORK.—For the erection of three houses for Captain Dabner, Summer Hill, South Cork. Messrs. W. H. Hill & Son, architects, Cork:—
 J. E. O'Connell... £1,405
 T. Sisk & Sons... 1,405
 E. Gaul... 1,400
 J. Kerras... 1,325
 Edward Fitzgerald, Geraldine Place... 1,200
 * Accepted.

HAMPSTEAD.—For extension of stables, England's Lane, Hampstead, for Messrs. Richards, Ltd. Mr. T. Wilson, architect, 34 New Bridge Street, E.C.:—
 Thompson... £399 Pugh... £447
 Pearson... 475 Williams... 420
 Littlewood... 478 * Accepted.

HUNSTANTON.—For the erection of new stables, &c. at the Glebe Hotel, Hunstanton. Mr. Herbert J. Green, architect, 31 Castle Meadow, Norwich:—
 W. H. Brown, King's Lynn... £1,719 0 0
 W. Sindall, Cambridge... 1,515 0 0
 John Cracknell, Peterboro... 1,419 0 0
 Geo. Chambers & Sons, Snettisham... 1,411 6 3
 Reuben Shanks, Chatteris... 1,394 0 0
 W. Saint, Cambridge... 1,384 0 0
 A. F. Foreman, King's Lynn... 1,370 12 0
 F. Giddings, St. Ives, Hunts... 1,338 0 7
 * Accepted conditionally.

LONDON.—For improvements at Lucas Street School, Greenwich, for the London School Board. Mr. J. Bailey, architect:—
 F. & H. F. Higgs... £15,247 J. & M. Patrick... £13,306
 W. Downs... 14,707 J. & C. Bowyer... 13,286
 G. E. Wallis & Sons... 14,234 C. Cox... 13,149
 Holliday & Greenwood... 14,834 Kirk & Randall... 12,834
 Ltd... 14,030 J. Smith & Sons, Ltd... 12,597
 J. Garrett & Son... 13,663 Stimpson & Co... 12,400
 E. Lawrence & Sons... 13,570 * Recommended for acceptance.

LONDON.—For adaptation of ambulance steamboat "Red Cross" for conveyance of recumbent patients, for the Metropolitan Asylums Board:—
 Ellyth & Pascoe, 10 London Street, E.C... £1,710 10
 W. S. Needham, 1 Derrick Street, Commercial Road... 1,063 10
 Docks
 W. C. Reeder & Co., 1 Railway Place, Fenchurch Street, E.C... 1,643 15
 * Accepted.

COMING EVENTS.

Wednesday, March 5.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Evening.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Meeting).—Mr. George Witlet on "A Visit to Oxford," 8 p.m.

ROYAL ARCHEOLOGICAL INSTITUTE.—Prof. T. McKenny Hughes on "Early Potters' Art in Britain," Mr. F. G. Hilton Price on "Pawnbrokers' Signs in London," 4 p.m.

THE CHEMICAL SOCIETY.—Meeting at 5.30 p.m.

BUILDERS' FOREMEN'S AND CLERKS OF WORKS' INSTITUTION.—Ordinary Meeting at 8 p.m.

BRITISH ARCHEOLOGICAL ASSOCIATION.—Meeting at 8 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Inspection and demonstration at L.C.C. Common Lodging-House, Parker Street, Drury Lane, W.C., at 3 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to the Works of the Vauxhall Bridge, at 2.30 p.m.

Thursday, March 6.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting, at 8.30 p.m.

CARPENTERS' COMPANY (Lectures at Carpenters' Hall).—Prof. W. Ramsay, LL.D., Ph.D., F.R.S., on "The Bearing of Modern Chemical Theory on some problems connected with the Building Trade," 8 p.m.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Mr. N. O. Gedge, B.Sc., A.M.I.C.E., on "The Causes and the prevention of the Erosion of Sea Coasts," 8 p.m.

Friday, March 7.

ARCHITECTURAL ASSOCIATION.—Mr. James Miller on "The Glasgow Exhibition," 7.30 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. F. E. P. Edwards, A.R.I.B.A., on "Elme's Work in Liverpool."

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. Wilson Beaton on "Glasgow International Exhibition, 1901," 8 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. Henry R. Kenwood on "Elementary Statistics," 7 p.m.

Saturday, March 8.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Edinburgh and Leith Corporation's New Gas Works at Granton.

GLASGOW TECHNICAL COLLEGE SCIENTIFIC SOCIETY.—Mr. Frank B. Lea, B.A., on "The Design of Conductors for Electric Railways."

ROYAL INSTITUTION.—Lord Rayleigh on "Some Electrical Developments"—IV., 3 p.m.

Monday, March 10.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Prof. R. Elsey Smith, A.R.I.B.A., on "Building Materials," 7 p.m.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Bristol Society of Architects.—Mr. Howard Chatfield Clarke, F.S.I., on "Ancient Lights," 8 p.m.

Tuesday, March 11.

ROYAL INSTITUTION.—Prof. E. B. Poulton on "Recent Researches on Protective Resemblance, Warning Colours and Mimicry in Insects"—I., 3 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. Wright Clarke on "Details of Plumbers' Work," 7 p.m.

MANCHESTER SOCIETY OF ARCHITECTS (Students' Meeting).—Debate on "Is it possible to get Coloured Facades in this City?"

Wednesday, March 12.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Prof. G. Baldwin Brown on "Some Thoughts on the Dome as an Architectural Form," 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Meeting at 7.30 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Annual Dinner at the Merchant Taylors' Hall, Threadneedle Street, E.C., at 7 p.m.

Thursday, March 13.

CARPENTERS' COMPANY, Carpenters' Hall, E.C.—Prof. T. Roger Smith, F.R.I.B.A., on "Exeter Cathedral," 8 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Ernest Newton on "House Building," 6.30 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Mr. Edwin O. Sachs on "Artistic Electric Illumination."

MANCHESTER SOCIETY OF ARCHITECTS.—Paper by Mr. Charles M. Hadfield.

Friday, March 14.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. H. C. Landers on "Co-operative Homes," 7.30 p.m.

INSTITUTION OF JUNIOR ENGINEERS.—Mr. Percival Marshall on "The Uses of Engineering Models," 8 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Mr. C. Hadfield, F.R.I.B.A., on "True Building."

PHYSICAL SOCIETY.—Meeting at 5 p.m.

THE LATE J. F. BENTLEY.

IN APPRECIATION BY HALSEY RICARDO.

THE loss of Mr. Bentley, at the age of sixty-two, is perhaps the heaviest blow that could be struck at the architectural world of to-day, for whilst there might be expected many more years of work from a man of that age, he had already, by the works he had done, proved himself one of the ablest architects of our time. The time that he had spent in practice was considerable; and the experience he had obtained from it quite remarkable; indeed, until one came to see the way he built up and assimilated his experience, it appeared almost superhuman. A man of strong convictions, with a clear and retentive memory, he had a temperament both analytic and creative, with the thoroughness of the artist. He was the prophet—one may so describe him—on whom the mantle of Mr. Butterfield fell: both were strong individualists, both were men of unalterable conviction, of deep insight, of high aim, and the sincerity of their purpose burns through their work. Born a generation (nearly) later than Mr. Butterfield, Mr. Bentley had both the disadvantages and the benefits of his time, and the marks of them show themselves upon his buildings. He could not make old forms and old methods go so far as his predecessor. The England of his youth was widely altered from the land about which Mr. Butterfield roamed as a young man educating himself. The old was fast giving place to new: inventions of all kinds were displacing the traditional methods and ousting the old materials. The use of machinery was becoming universal and the *genius loci* had to fly, disparaged and ignored, into the few remote coverts left from the invasion of the railroad. He had to stand by and observe strange foreign erections grow up in his domain, calling themselves Gothic and claiming kinship with him and yet really more hostile to all that he called his own and considered devoted to him than the professed examples of the "correct" schools—those importations of learning and scholarship from over the seas, by men who set themselves to supplant him and erect another genius in his stead. In 1830, when Pugin started on his career as the champion of Gothic architecture, the protector and reconstructor of mediæval buildings, innumerable examples of actual Gothic work were dotted over the face of the country. Neglected, despised, cobbled and patched, put to perverse uses, there they stood, authentic in what they showed, with a world of authentic history spread over and cut upon the patient stones. In 1856 the case was widely altered. Most of these examples had been taken in hand, rescued from their long neglect, trimmed up, pared and returbished with the blind fervour of the anti-

quarian, and they stood there clean, fresh, and rehabilitated, professedly authentic—but authentic really no more. Freed from the age of the past centuries, and divested of the veritable history those centuries had brought, they presented a conjectural youth, unconvincing and uninformed. To the architect they had become silent, uninteresting.

On the other hand the great expansion of England was well under weigh, the era of science well begun. Social life was rearranging itself: new duties and new responsibilities were coming to the front: new agencies were at work: the very notions of time and space were being changed. By the aid of steam the utmost antipodes were only a calculable distance away: the voyage there could be determined to the day and punctuality demanded. By electricity, they were put within speaking

large treatment of concrete, brickwork and steel girders; much as it might be discerned in the great roads, harbour works and concrete constructions of the Romans. But the architect by his training could make no advance. What had been done he could copy—but for developments he had no warrant. Under the contract system it was impossible to make experiments: neither time nor his reputation permitted modifications as the work proceeded. The architect adopted for his own purpose the conclusions of the engineers, not so much as stepping-stones to further excursions, but as the piers on which he was going to place his edifice. The design of the building did not grow out of the construction, but was an added affair, often in conflict with the very principles of the construction. The position of the individualist architect consequently was this: to

CHURCH OF THE HOLY ROOD, WATFORD: ALTAR. THE LATE J. F. BENTLEY, ARCHITECT.

distance. Fifty years ago there seemed to be no limits to the benefits an extended use of machinery might not bring us, and a larger view of human relations obtained. Schools, libraries, hospitals grew up as a consequence of the great arterial system of railways permeating Great Britain. The conveniences of travel, of transport, of shipment, demanded wider knowledge, a wider grasp of consequences. New points of view presented themselves, new requirements—in architecture new methods of construction. This was soon found to be incompatible with the formulæ (as enunciated) of the revived Gothic, which only worked provided that all the building forms were kept carefully within the confines of precedent, and a revolt against these formulæ was the consequence. The spirit of Architecture was gone. It was not with the architects. To some degree it might be discerned amongst the engineers in their

acquaint himself accurately with the possibilities of the materials he was about to use and to confine himself to the use of those only which he had mastered. From the first Mr. Bentley's knowledge showed itself. His treatment of brick and stone has a peculiar stamp upon it that reveals himself. He does not treat brickwork as a bricklayer would who was laying the bricks of a house of his own devising—he does not heap up and shape stone as a mason would who was building as Robert Grumbold did at Cambridge—but he came as near to it, probably, as a man may who is not a bricklayer nor a mason. He brought to bear, besides his critical insight, a keen sympathetic intelligence and a patient enquiry into the nature of processes as well as of things. No detail was so small as to pass his eye unquestioned. Craftsmen rejoiced in his designs. Here was a man who knew how a thing should be done—

who could design a thing that should tax their abilities but not strain them—that should illustrate the qualities of their material, not disguise them. His working drawings were a pleasure to look at: they were beautiful even, as pictures, but their merit was their clearness and their thoroughness. So far as diagrams on paper can ever show what has to be done, his plans gave that information. He not only conceived the object made, he conceived it in the making and indicated on his drawings the intermediate processes. It is a noticeable feature on a drawing when it shows how the thing has come. But these definite sign-manuals on his finished work I take to be, in a sense, his limitations. The cathedral at Westminster, his largest work, is great, I will not say in spite of them, but its greatness is independent of them. As it stands at the present moment, the outside is virtually finished, the inside shows only the carcase. The contrast is instructive in many ways. The outside is encrusted with detail, with a profusion remarkable and, for a modern building of such a size, unparalleled. The detail is fresh and new to us, vigorous, full of thought and erudite, giving to the building the interests of surprise and novelty. But much of the detail is not organic: it has not grown out of the requirements of the structure or the conditions of the place, but has been inserted by deliberate contrivance. The importation is ingenious, scholarly, and shows a great knowledge of the handling of material—nevertheless they are accretions, not growths, and by the time the London weather has dulled the surface and eaten into the edge of them, they will have been relegated, as some items more, to the large heap of revived features in the Golgotha presided over by Style. Let us enter the cathedral. About us—to use rather an inflated expression—is construction in its majesty. We are in communion with a fine soul. This is Art—the Art of Architecture. Before us are the outpourings of passion, of reverence, of high aim, of faith. Constructive knowledge taught Mr. Bentley how to poise his domes athwart the nave; it could not suggest that he should pierce the dome over the sanctuary and lift the brooding twilight from off the high altar. But the suggestion made, constructive

CHURCH OF THE HOLY ROOD, WATFORD.

CHURCH OF THE HOLY ROOD, WATFORD.

knowledge showed him how to shape his domes, how to mass the brickwork in his piers and buttresses, so that the whole body (I cannot call it a carcase!) is a living organism. The great diapered lunettes that light the clearstory of the nave with their latticed tracery account for themselves as plainly inside as they showed their function on the exterior—outside they were the arches transmitting the weight of the domes to the buttresses, whilst inside it was the trellised void beneath them that counted as of such service, tempering the light into a particularly fascinating quality. One might take any of the great features of the interior and follow them up with increasing delight: the domes with their shell-like overcoats: the flat table-land on which they sun themselves: the galleries that thread their way through piers and division walls: the profusion and the economy of the brickwork—there is so much he has to tell. I wish that the architect had been laid to rest beneath the cupola that watches, mild-eyed, over the sanctuary. He had, to use Prof. Lethaby's phrase, "built his life into the church" and it seems appropriate that the building which holds his life should also hold his body after life.

The Roman Catholic Church at Watford is an example of Mr. Bentley's work, complete (except the tower) in all particulars. Outside it is a demure flint and stone building, making no pretension, clipt in middle, Exeter wise, by two small octagonal turrets. Entering, one is considerably surprised by the sense of size and the exceeding richness of the decoration. The east end is a mass of colour. All that stained-glass, painting, coloured and gilt carving, and woven hangings can do, is there. The effect is gorgeous. And yet the means used are very simple: the usual ingredients of carved and moulded stonework, marble shafts, &c., are absent or only occur most sparingly—but there is a nervous elasticity in the sparse stonework and the tense arches that reveals great knowledge and character. The exterior of the Priests' Seminary at Hammersmith is known doubtless to the majority of the readers of the BUILDERS' JOURNAL. Beaumont College, Windsor, is known to me only by photograph. It must rank in size and importance next to the cathedral as example of Mr. Bentley's work: but though it has his

handwriting unmistakably over it all, it does not, I think, show Mr. Bentley at his happiest. The entrance front stands self-conscious, ill at ease; the chapel comes as an adjunct at the side and not very comfortably either: nor does the building, until you come to the back of it, express clearly its purpose.

Mr. Bentley, as well as Mr. Butterfield, passed for Gothic architects in the world at large—they were called so, and considered themselves so; but they really were descendants of Inigo Jones: individualists who used Gothic forms in which to express themselves and akin to the mediæval builders only in their efforts to know the utmost yet ascertained about the materials they were using.

Much of the force of Mr. Bentley's work comes from the knowledge he acquired when on the scaffold and in the workshops, and one could hardly specify a better training for a young architect than what he gave himself. With this knowledge as basis, he was able to analyse and detect new departures and to digest or repudiate them, was able in some measure to create new advances, from his recollection of what has been done and knowledge of how things should be done. He had, as I have said, the artist's qualification of thoroughness, which enabled him to express himself and his message to his fellow-men. Gifted, shy, he stood apart from his fellow-craftsmen and the great world of the daily newspapers scarce knew of his existence. Substantially, when he died, his work was done; and he has been spared the pain of seeing the actual consummation of his work—he has lived with it finished in his mind's eye and that picture, the ideal that cannot be realised, he has taken with him into the grave.

JOHN FRANCIS BENTLEY, who died of paralysis on Saturday, March 1st, and was buried on Wednesday last at Mortlake Catholic cemetery, was born at Doncaster in 1839, the younger son of a numerous family. He was a typical Yorkshireman. As a boy he exhibited great taste for drawing and was particularly fond of talking to workmen about their work, especially masons' work. At this time he made from memory a model of old St. George's Church at Doncaster, which church was burnt down about 1852. Directly after the fire Sir Gilbert Scott took the matter in hand and rebuilt the church, and it was here that young Bentley was

CHURCH OF THE HOLY ROOD, WATFORD.

put in the clerk of works' office—more perhaps to keep him employed than for anything else; he, however, learned a good deal about the setting-out of masonry and similar work. In the 'fifties, when about sixteen, he came to London, being placed with Holland & Hannen, the well-known firm of builders, with whom he gained considerable experience. He afterwards entered the office of the late Henry Clutton, about whom it is interesting to note that he was the author of the first design for a Roman Catholic cathedral at Westminster. After working for several years in Mr. Clutton's office Bentley commenced practice for himself (in 1862) at 13, Southampton Street, Strand, at which time he joined the Roman Catholic communion. Of the numerous works which he afterwards executed the following are the most important:—

Roman Catholic Churches.—St. Francis of Assisi, Pottery Lane, Notting Hill, London, W. (baptistry, priests' house and altars). Corpus Christi, Brixton Rise, London, S.W. St. Mary of the Angels, Bayswater, London, W. (alterations, altars, stained glass, &c.). St. Charles Borromeo, Upper Ogle Street, Langham Street, Marylebone, London, W. (very fine altar). Rebuilt the Franciscan Convent at Notting Hill, London, W. Chapel and convent, Braintree, Essex. Chapel and convent, Taunton. St. John's College, Beaumont, Windsor (for the Jesuits). Ushaw College, Durham (altars and decoration in Lady chapel). Church of the Holy Rood, schools and priests' house, Watford, Herts (where Bentley executed everything—stained glass, sculpture, decoration, &c.). St. Thomas's Seminary, Hammersmith (Cardinal Manning gave this commission). St. Mary's Church, Clapham, London, S.W. (enlargements, very fine schools, altar, Lady chapel and exquisite stained glass). St. Mary's, Kensal Green, London, W. St. Etheldreda's, Ely Place, Holborn (organ screens, &c.). St. James's, Spanish Place, Manchester Square, London (four altars, shrine, &c.). St. Mary's, Cadogan Place, Chelsea, London, S.W. Westminster Cathedral, Cathedral at Brooklyn, New York (complete designs prepared: Bentley visited the United States about three years ago on this important commission).

Anglican Churches.—St. Botolph Without, Aldersgate Street, London (restoration and decorative work). St. Botolph Without, Bishopsgate Street Without (restoration and decorative work). New Church at Chiddingstone, Kent. Bolney Church, Sussex (restoration). St. Mark's Church, North Audley Street, Grosvenor Square, London, W. St. John's, Hammersmith (church designed by Butterfield—new chapel and organ by Bentley).

Domestic Work.—"Carlton Towers," near Selby, for the late Lord Beaumont (an unfinished house designed by one of the Pugins, transformed by Bentley, who designed all the finishings, decoration, furniture, &c.). House at Ascot, for H. Maxwell Stuart, Esq. Houses at Staines, Doncaster and elsewhere, including one—"Herrons' Ghyll," Surrey—for the late Mr. Coventry Patmore. The Archbishop's House, Westminster. Fountain at Saffron Walden, near houses by Nesfield and Norman Shaw.

Mr. Bentley left a widow and family of nine children.

CHURCH OF THE HOLY ROOD, WATFORD, HERTS. THE LATE J. F. BENTLEY, ARCHITECT.

Correspondence.

"Right to make Openings into Lane."

To the Editor of THE BUILDERS' JOURNAL.

LISCARD.

SIR,—Allow me to say that after forty years' experience, in such matters I entirely disagree with Mr. Johnson-Roberts's answer to the above on p. 12 of your issue for February 12th. In the first place, A has only had possession of his land for fifteen years, and the lane or passage in question, originally being part of the adjoining

only to the present owners of the estate, similar to an occupation road.

In the third place, the lane being still unadopted by the local authorities, the cost of keeping it in repair has to be borne by the present owners of the estate, who, having also paid for the cost of making the whole of the lane, can prevent A or anyone else from making an entrance into it; besides, the site of the lane itself may be included in the conveyance to each purchaser of property abutting on it, as is often done in the sale of such estates, with the proviso that each purchaser keeps his portion in proper repair. The estate having been sold on lease, the reversioners will have a say in the

Mr. Winter asserts that querist has no right of way through the lane by lapse of time or user (technically, "prescriptive right"). I never said he had. Mr. Winter's contention (if I understand it correctly) seems to be that the fact of an adjoining owner making a lane outside querist's boundary wall prevents querist from exercising his legal rights over that portion of his own ground which adjoins the new lane, by preventing him, for example, from removing portion of a wall erected and owned by himself and standing on his own ground. This proposition is decidedly untenable. If, however, querist asked me the further question, Could the opening or door so made be used as a means of ingress or egress to or from his premises through the lane?—I would answer, that depended on who owned the ground of which the lane formed a part, and whether it was still vested in its original owners or had passed to the local authorities. From querist's letter and the accompanying map I gathered the latter was the case. I then gave my opinion, with which, "if my inference" as to ownership is correct, I trust Mr. Winter will agree.—Yours truly,

W. JOHNSON-ROBERTS.

Books on the Cross.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—*"Sunderland"* (see p. 29, February 26th) might procure *"The Masculine Cross, or a History of Ancient and Modern Crosses,"* which takes the reader back long before the Christian era and gives illustrations of the God Indra nailed to a cross, the Buddhist cross (much like our Calvary cross), and the ancient heathen Mexican cross, all dating from probably thousands of years before the advent of Christ. It also illustrates the (now called) Maltese cross, so commonly found upon ancient Assyrian monuments. Of the latter, anyone visiting the galleries of the British Museum may see life-size effigies in stone of the kings Samsi-Rammanu, B.C. 825, and Assur Naṣir-Pal, B.C. 880, both of whom have suspended from their necks and resting on their breasts sculptured Maltese crosses, each about 3in. in diameter.

"The Legendary History of the Cross" is a Dutch book printed and published by Veldener, A.D. 1483. It contains sixty-four curious woodcuts illustrating the whole story, traditionally believed to be that of the actual wood of which the Cross of Christ was made. This curious book was known in the language of the place as *"Boec van den houte"* (literally the *"Book of the Tree"*).

The most dreadful and perhaps the most costly of all the valuable books in my collection is entitled *"Triumphus Jesu Christi Crucifixi,"* printed by the Plantin Press at Antwerp in 1608. It contains exquisitely-engraved plates showing crucifixions in no fewer than seventy different ways—a most horrific book.—Yours truly,

HARRY HEMS.

Eastbourne Technical Institute Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The conditions of the above competition strictly limited the cost of the buildings to £20,000, with an additional margin of 10 per cent. The result of the builders' tenders upon the first premiated design has just been published, and shows that the lowest tender received was £37,920 (see p. xvi of this issue). This is most unfair to all those who submitted designs in the competition, and as competitors we desire to enter a protest.—Yours truly,

COMPETITORS.

Royal Academy Exhibition, 1902.

The receiving day for architectural works is Thursday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors and to forward them (free of expense) to Burlington House. In order that careful reproductions may be made for publication, it is requested that drawings be sent as early as possible. No drawings can be received by us later than noon on the sending-in day.

ST. MARY'S CHURCH, CADOGAN PLACE, CHELSEA, LONDON, S.W.
THE LATE J. F. BENTLEY, ARCHITECT.

Photo: H. Irving.

estate, was not made or formed for "many years afterwards," and when so made was for the sole use and benefit of the estate and the property built on it, the cost of forming and constructing the lane evidently being borne by the original owners or purchasers of the estate.

In the second place, the very fact of the lane remaining still "unadopted," and having been so recently made as "many years" after the commencement of the fifteen years mentioned, gives the public no right of way, although by courtesy the public have been allowed to use the lane up to the present time, but not long enough to claim a right of way by law. In fact, it is a lane or passage common

matter also, but no doubt an arrangement could be come to between all parties by A agreeing to pay half the cost of the construction of the lane so far as the same abuts on A's land.—Yours truly,

E. WINTER.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read Mr. Winter's criticism, but fear he did not read my answer with sufficient care. I stated: "I infer it (the lane) has vested in the local authority as a public thoroughfare or right of way. If my inference is correct (i.e., that the lane is a public thoroughfare vested in the local authority), I see no objection whatsoever to A making an opening in his boundary wall," &c.

WESTMINSTER CATHEDRAL FROM THE SOUTH. THE LATE J. F. BENTLEY, ARCHITECT.

L. Dickro.

MEN WHO BUILD.

No. 68.—JAMES MILLER, I.A.

IT is befitting, in view of the remarkable success of the Glasgow Exhibition buildings as a monumental architectural design, to review the work of the architect, Mr. James Miller. It is just twenty-three years since Mr. Miller entered the office of the late Mr. Andrew Heiton, architect, of Perth. At that time Mr. Heiton's work was both extensive and varied, for his practice was not confined to his own town or county but extended over the greater part of Scotland, so that Mr. Miller had excellent opportunity of gaining wide experience. After completing his articles with Mr. Heiton he spent several years in one or two Edinburgh offices, and eventually obtained an appointment in Glasgow from the Caledonian Railway Co. to prepare designs for several stations and other buildings on their system in the West of Scotland, where he remained till 1893, when he commenced practice on his own account in Glasgow.

For several of his first commissions Mr. Miller was indebted to the Caledonian Railway Co., they having entrusted him with the designing and carrying out of a considerable portion of the architectural work required in connection with the new Glasgow Central Railway. About this time he also received a commission from the Glasgow and South-Western Railway Co. to design their new terminal station at Princes Pier, Greenock (illustrated on p. 61 of this issue) and another from the Glasgow and District Subway Co. for their station in St. Enoch Square, Glasgow. The plan of the Princes Pier station is an interesting and instructive treatment of a difficult architectural problem; the curved inclined ways for luggage and goods well serve their purpose and lead to a good exterior.

It will be noticed that in much of his early work Mr. Miller was perforce associated with engineers—an association which from practical and constructional considerations he has found to be of the greatest value. He has a great admiration for engineers and their work, and understands their aims and methods. As Mr. Miller says, the engineer if he is anything is an exact man; he may not always "design in beauty," and as a rule he is frank enough to admit it; his first thought about his work is utility. It is this latter quality in the work of the engineer, thinks Mr. Miller, that architects should lay a little more to heart, for the vital element, as he expresses it, of all architectural design is utility. The word "utility" is somewhat misleading and is usually open to the interpretation

that it includes only our bodily and not our sensuous needs. It is here that the engineers fall into error, for they neglect generally to appeal to the intellectual pleasure as well as to the body. The essential of art undoubtedly is that it should express ideas, and pure engineering works are art-works in the sense that they are the product of thought and express that thought to those who are able to read these works, and the idea innate in an exact fitting to a purpose or the expression of an impulse or action gives beauty as in natural objects. Thus Mr. Miller believes that in their elements architecture and engineering are the same, what difference there is lying in the former adding what may be called the graphic or pictorial element to the latter, harmonizing all parts and appealing to the senses more directly. As an example of the beauty that is apparent in purely utilitarian works we may refer to the two views of the Glasgow Exhibition buildings in course of construction illustrated in our centre plates, which beauty will be apparent to any unbiased observer. The pleasure obtained is in proportion to the educated appreciation of the value of these works, and architects are often inclined to deny that beauty is existent in engineering works because engineers do not reckon to be artists or claim any beauty for them, but no unbiased critic with knowledge of their value can fail to see the beauty in these two views of the skeletons, if we may call them, of Mr. Miller's designs, which met with such praise when fully clothed.

Next to utility he is of the opinion that the architect should study his massing and proportion. It is a mistake to worry over detail while the general mass is wrong, for no amount of detail, however fine, can redeem a building which is essentially bad in its proportion or mass. The relation of this to what we have said in regard to utility will be apparent.

With what good effect Mr. Miller gave heed to this is apparent in his designs for the Glasgow Exhibition buildings and the Belfast City Hall dome (the latter was one of the three premiated designs selected by Mr. A. Waterhouse, the assessor, in a competition held three or four years ago). The dome of the former, it is evident, is founded somewhat upon the latter design, the grouping of the subsidiary masses being in essence the same.

It is hardly possible in these high-pressure days for a man to be an engineer and architect at one and the same time, and the man who attempts to do so will almost surely fail in one or the other or, what is more likely, in both. It is to be regretted that in this country the example of our Continental neighbours is not more often followed, where the engineer, architect and sculptor are frequently associated in carrying out works of public importance, with the happiest results, such as for example the beautiful Alexander III. Bridge over the Seine at Paris. Without such an association this wonderful monument could never have been produced.

About the time Mr. Miller commenced practice he was successful in gaining two local competitions, namely, Belmont Church, Hillhead, Glasgow, and Clydebank Burgh Buildings, including a town hall and baths (the former is designed in Early English Gothic, while the latter is a Renaissance building).

Mr. Miller has done a great amount of work, some of his most recent being Coupar Grange, Perthshire, for Mr. James Duncan, of London, and No. 6 Lancaster Crescent, Glasgow, for Mr. Alexander Moore, jun.; of this latter house we give several interior views.

Towards the end of 1898 Mr. Miller was successful in gaining the competition for the Glasgow International Exhibition Buildings in

NO. 6, LANCASTER CRESCENT, GLASGOW: HALL.

NO. 6, LANCASTER CRESCENT, GLASGOW: DINING-ROOM.

Kelvingrove Park, which were opened in May last year. An idea of the extent of work entailed in these buildings may be gathered from the fact that those erected from Mr. Miller's designs covered an area of between 60,000 and 70,000 sq. yds. The chief of them was the Industrial Hall, which was 700ft. long by 320ft. wide. The Machinery Hall was 500ft. long by 320ft. wide, and the provision of galleries running down the centre (see centre plates) was a most happy conception. The Grand Concert Hall was a circular building 140ft. in diameter and 80ft. high. It had a gallery which surrounded the whole building except at the part occupied by the platform, and accommodated between 4,000 and 5,000 persons. Built in connection with the Concert Hall was one of the largest restaurants in the grounds.

The Grand Avenue was 1,200ft. long and 75ft. wide, and connected the Industrial with the Machinery Hall. We illustrate this last in course of erection with its arched timber roof, cheap and thoroughly effective for temporary work. The proportions of the interior of this building could not be judged at the time the exhibition was being held, as the stands obscured a clear view and were so various in form, but we think our illustration enables one to judge of the vastness of the building and the grandeur and harmony obtained by using simple means.

These were the principal buildings connected with the exhibition, but there were about a dozen other buildings throughout the grounds of more or less importance designed and carried out by Mr. Miller. He also designed for Messrs. Wylie & Lochhead, of Glasgow, the suite of rooms in the exhibition known as the Royal Reception Rooms.

The first sod of the Exhibition buildings was cut in April, 1899, and the whole of the buildings were completed and opened on May 2nd, 1901, thus occupying just about two years in construction. For Mr. Miller to have performed such an immense amount of work with such excellence is remarkable; and more so when one considers the freshness and fertility of the details of the buildings. We need not refer further to the Glasgow Exhibition buildings, as we publish in this issue a paper on the subject read before the Architectural Association last week by Mr. Miller.

The following is a list of some of the principal works carried out from his designs or at present under construction:—

Belmont Church, Glasgow; Kelvinbridge Mansions, Glasgow; Clydebank Burgh Buildings, town hall, library and baths; Kelvinbridge

Station, Glasgow; Botanic Gardens Station, Glasgow; Glasgow and District Subway Station, St. Enoch Square, Glasgow; Craiguchty, Aberfoyle; Princes Pier Station, Greenock; Bridge of Weir Schools, Renfrewshire; house for Mr. John Kyle, Ayrshire; Coupar Grange, Perthshire; additions to Peebles Hydropathic, Peebleshire; house for Mr. Alexander Moore, jun., Glasgow; additions to Central Hotel, Glasgow; commercial premises, Union Street, Glasgow, for the Caledonian Railway Company; stable offices at Wemyss Bay for the Hon. Misses Burns; Glasgow International Exhibition Buildings. Several of these will be found illustrated in this issue. He has also been appointed architect for the reconstruction of the Royal Infirmary, Glasgow at a cost of about a quarter of a million sterling.

ARCHITECTURAL ASSOCIATION.

MR. MILLER ON THE GLASGOW EXHIBITION BUILDINGS.

A MEETING of the Architectural Association was held on Friday evening last at 9, Conduit Street, W., the chair being occupied by the president, Mr. W. H. Seth-Smith. After the minutes of the last meeting had been read and confirmed, the following were elected members of the Association:—S. Leaning (London, S.W.), E. G. Besant (Cambridge), R. O. Constant (Wimbledon), T. F. B. Pittar (Putney) and B. Procter (London, W.). It was agreed that a letter of sincere condolence be sent to the family of the late Mr. Bentley. The president announced the following additional donations to the New Premises Fund:—

	£	s.	d.
W. Howard Seth-Smith (second donation, making £100 total) -	50	0	0
A.A. Day School Students -	13	0	0
Henry Muff -	10	10	0
J. Olmud Scott -	10	10	0
G. Sherrin -	10	10	0
L. A. Shuffrey -	10	0	0
W. Hilton Nash -	5	0	0
E. B. Muff -	2	2	0
T. Frank Green -	2	2	0
Rowland Plumbie (provisional promise)	100	0	0
	213	14	0
Donations previously announced	3,731	1	6
Total	£3,944	15	6

A vote of thanks was passed to the Pearce Portland Stone Co. for presenting to the Day School seven cubical blocks from the different beds of Portland stone formation, and to Mr. A. Brumwell Thomas, through whose kind offices they were obtained. Mr. James Miller then read his paper on the buildings of the Glasgow International Exhibition, 1901, which was illustrated by numerous drawings, photographs and lantern slides.

Mr. Miller said that in Chicago and the several Paris Exhibitions the symmetrical or axial plan had been adopted, and he was of opinion that, wherever it was possible, this was the finest and grandest form. In Glasgow, however, the site precluded the adoption of such a plan.

It was the architect's intention to have placed a great central feature in the form of a monumental fountain 60ft. in diameter, surrounded by a row of columns 40ft. high, each column supporting a gilded winged figure, with a great circular illuminated tower 120ft. high rising from the centre of the fountain; but this was never carried out. Kelvingrove Park is studded with fine trees, and it is interesting to note that

NO. 6, LANCASTER CRESCENT, GLASGOW: DINING-ROOM.

not one of these was sacrificed. Many of the smaller buildings were introduced long after the original plans were matured, which explains in a measure the somewhat irregular arrangement in certain parts of the grounds.

Having thus roughly outlined the principal features of the site, Mr. Miller proceeded to describe the buildings in detail.

The piers carrying the dome of the Industrial Hall were constructed of wood up to the level of the external platform, 60ft. from the floor, the dome itself being formed of steel ribs placed at

about 14ft. centres, connected at the top with a braced steel ring of sufficient weight and strength to carry the fleche. The internal surface of the dome was covered with fibrous plaster moulded to the curve and nailed to $\frac{3}{4}$ in. boarding fixed to the purlins, the slabs having a finishing coat of putty lime $\frac{1}{4}$ in. thick, as on the external walls. On the outside was fixed $\frac{3}{4}$ in. boarding, covered with a smooth-surface floorcloth, this being the cheapest and most suitable material that could be found to take the gilding with which the dome was covered. Various materials

for the gilding were experimented with. Real gold leaf was too costly, and various lacquers and imitation gold-leaf were tried, but these soon became black in the chemically-charged atmosphere of Glasgow. The most satisfactory material was found to be aluminium leaf covered with a yellow lacquer, which gave an effect resembling real gold at about 1s. 10d. per sq. yd., but even this as a lasting material fell far short of the real article.

Mr. Miller next described the four great towers surrounding the dome, which were of wood faced with fibrous plaster slabs, 4ft. by 3ft. and $\frac{1}{2}$ in. thick, nailed direct to the timber framing. A space of about $\frac{1}{4}$ in. was left at the joinings, and the outside entirely floated over with a finishing coat of stucco, $\frac{1}{2}$ in. thick, squeezed through the joints.

The lecturer next described in detail the construction of the roof over the main central avenue of the Industrial Hall. The corrugated iron used was No. 24 B.W.G., not galvanised, but dipped in linseed oil, it being intended to be painted; but, whether painted or not, Mr. Miller's experience was that all corrugated iron should be galvanised, even for temporary work which was to be painted, for, if not galvanised, the thin sheets very soon corroded. Galvanising also had the advantage of increasing the strength of the sheet, making it equal to an extra gauge in thickness. With regard to the lighting, the area of glass in proportion to floor area in this and the other buildings was as 1 to 2; in other words, 50 ft. super. of glass to every 100 ft. super. of floor area.

When circumstances permitted, Mr. Miller considered that a more even and better diffused light was obtained when that part of the roof next the ridge was glazed, instead of having the roof covering here and the glazing lower down. If the roof were of a very wide span a second stretch of glazing might be introduced lower down, but the largest section of glazing should be at the ridge. It was important that glazing, i.e., putty glazing, should be done in dry weather. In frosty weather it was dangerous for the workmen engaged on the roofs, and in wet weather the putty did not adhere to the astragal, leakage resulting, and nothing short of taking out the glass and re-glazing would make a satisfactory job. For these reasons every opportunity of dry weather should be taken advantage of to get the roofs glazed. The autumn preceding the exhibition year was perhaps the best time to get the glazing done.

In most of the exhibitions held in this country the floors of the industrial section were usually formed with battens 3in. thick laid with a space of about $\frac{1}{2}$ in. between the planks. At Glasgow, however, the floor of the Industrial Hall was laid with ordinary 1 $\frac{1}{2}$ in. boards tongued and grooved and laid close, facilitating cleansing and being more fireproof. Where there was a space beneath the floor it was advisable to cut the area into sections by means of brick walls

PLAN OF UPPER FLOOR

ST. ENOCH STATION, GLASGOW.
JAMES MILLER, I.C.E., ARCHITECT.

carried hard up to the under side of the flooring.

Mr. Miller referred to the following points to be considered in designing such a building as the Industrial Hall.

The gutters of the main roofs should be of ample section, with good falls, and ample provision should be made for down pipes to carry the water off. In a temporary building there was always a tendency to underdo rather than overdo such matters as these; yet more damage might be done by a heavy fall of rain in half an hour than all the extra cost of having proper gutters and sufficient conductors. For long straight gutters sheet-iron answered the purpose very well. It should be well bolted at the joints with a layer of canvas dipped in red lead inserted. For flashings, dome coverings and awkwardly-shaped gutters the best material was undoubtedly lead, say 4 lbs. to the ft. It was more easily worked to suit the various positions and awkward corners than either sheet-iron or

zinc; and, although the first cost was more, it would realise about two-thirds of its original cost when the buildings were demolished, so that the ultimate figure would not be much in excess of sheet-iron or a good class of felt when the painting of these latter was taken into account.

Every precaution should be taken against fire. As a general rule, it was better to use larger scantlings and fewer pieces than smaller sections with numerous parts.

Mr. Miller next described the Machinery Hall, the floor of which consisted of 9in. by 3in. battens laid close together and resting on cross runners 11in. by 3in., laid flat at 4ft. centres. Pipe channels were required under the floor and these should measure about 3ft. 6in. wide and about 5ft. deep, so as to allow a man to walk along and make the various connections or repairs to pipes. Parts of the flooring should be made movable at convenient intervals to give access to the ducts.

As to the ventilation of a machinery hall,

nothing short of mechanical ventilation was of any use, and a system of exhaust fans, sufficient to change the air in the building every fifteen or twenty minutes, should be provided to make the building at all comfortable in hot weather. The flooring over the ducts containing the hot pipes should also be insulated with some non-conducting material, as the boards soon become so hot as to make them uncomfortable to walk on.

After dealing with the boiler and dynamo houses and the lavatory accommodation, Mr. Miller described the Grand Avenue which connected the Industrial Hall with the Machinery Hall. The roof was of wood, and formed of laminated arch principals placed 14ft. 6in. apart, connected by 8in. by 2in. purlins, the arch consisting of three thicknesses of 7in. by 1in. pieces. In a roof of this kind the material used was so light in scantling that the downward thrust of the weight on the roof must be kept rigidly in a vertical plane, for if the arch buckled, which it had a tendency to do if not carefully made and

GLASGOW INTERNATIONAL EXHIBITION, 1901: THE INDUSTRIAL HALL, SANDYFOLD STREET ENTRANCE. JAMES MILLER, I.A., ARCHITECT.

DESIGN FOR NEW CITY HALL, BELFAST. JAMES MILLER, I.A., ARCHITECT.

put in position, it became an extremely weak truss, and would gradually go from bad to worse. The principals should be constructed on perfectly level ground, or preferably on a platform; the joints of the laminations should be cut true and joined tightly. Special care should be taken when erecting to keep the trusses flat, by poles bound from side to side.

The structural work of the Concert Hall was of steel. The steel principals were placed at 18ft. 6in. centres at the outer circumference of the circle, and were supported on two circular rows of steel columns, the inner and outer rows being 12ft. 6in. apart. The roof was saucer-shaped, and rose to 62ft. above the floor level at the centre. Externally it was covered with McIlwraith's canvas decking, a material having a smooth surface somewhat like linoleum, forming a very suitable surface for paint, and keeping longer clean in a smoke-laden atmosphere than canvases or felts of a rougher texture. It should be nailed with copper tacks, placed about 1½in. apart; ordinary tacks, even for a temporary purpose, should be avoided, as they rust and break away, causing leaks and discolouring the roof.

The Concert Hall was the only building in which a system of heating was introduced. As in most round buildings, there was a tendency to echo when but sparsely filled. A system of festooning hung from the ceiling was adopted, which, to a great extent, obviated the defect. The interval of the echo increased as the centre of the building was approached by the speaker, the longest interval being when the speaker was immediately under the apex of the roof—a position, of course, which was never occupied in practice.

In speaking of the artificial lighting of the various buildings and the grounds, Mr. Miller said that electricity was the only illuminant which should be used for the inside lighting of exhibition buildings, and there could be no doubt as to the decorative superiority of incandescent over arc lamps. Of course, to produce the same illumination the former required much more current than the latter; but in most of the large exhibitions a considerable amount of the lighting plant was supplied gratis by exhibiting firms. Throughout the grounds several systems of lighting were adopted, chiefly electricity, compressed gas and compressed oil.

In conclusion Mr. Miller dealt with the cost of the buildings.

The Industrial Hall cost about £60,000, or at the rate of 1½d. per cub. ft. (cubing the building from the ground line to half-way up the roofs), or equal to £2 8s. per sq. yd. of covered area. The Machinery Hall cost about £22,000, equal to ¾d. per cub. ft. or about 16s. per sq. yd. of

covered area. The Grand Avenue, where no steel was used in the construction, cost £9,300, equal to ¾d. per cub. ft. or £1 2s. per sq. yd. of covered area. All its walls were, however, more expensively finished than those of the Machinery Hall. The Concert Hall cost £12,600, equal to 2½d. per cub. ft. The various restaurants and kiosks throughout the grounds, which were built entirely of wood and plaster, ranged in price from £400 to £5,000, the price per cub. ft. of the more ornate being 2d. and of the plainer types 1½d. per cub. ft.—A discussion followed.

Engineering Notes.

Mr. Bryan Donkin, vice-president of the Institution of Mechanical Engineers, died last week. He was born in 1835.

The New Workhouse Infirmary, Richmond, Surrey, is being warmed and ventilated by means of Shorland's patent Manchester stoves with de-

scending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The last pile in the new Britannia Pier at Yarmouth was driven last week. The pier, which is over 800ft. long, is constructed partly of iron screw-piles, the sea-end resting on logs of Australian karri wood 70ft. long. The work has cost £70,000.

Ventilation of the "Tube."—As an outcome of the recommendations of Sir Benjamin Baker, steps have now been taken to bring about the efficient ventilation of the Central London Railway tunnels. A fan has been placed at the base of the lift shaft at Bond Street station to remove the vitiated air, fresh air taking its place by passing down the shafts at the various stations under the ordinary atmospheric pressure. The fan, which is 48in. in diameter, electrically driven, is capable of exhausting the air of the tunnels in about three minutes. The intention is to work the fan every night after the trains have ceased running, and thus to obtain a thorough daily renewal of the atmosphere.

"THE STRUCTURE OF CEMENTING MATERIALS."

The tables given below were received too late to be included with the article printed in last week's issue. Reference was made to them on the first column of p. 45.

Builders' Notes.

The Sheffield Building Trades Exchange is expected to be ready for opening about June next.

A Co-operative Builders' Association, on the labour co-partnership plan, has been started at Coventry.

The South Wales Building Trades Employers' Federation held a meeting recently at Newport, Mr. W. Thomas, Cardiff (president), occupying the chair.

Mr. George Howard, builder and contractor, of 52 and 53, King Street, Brighton, died recently at the age of sixty-seven years.

London County Council.—At last week's meeting of the Council a long discussion ensued on the adjourned special report of the Local Government and Taxation Committee dealing with the report of the Royal Commission on Local Taxation. An amendment exempting hospitals from rating was carried by a small majority.—Dr. Collins presented a petition from the owners and occupiers of properties in St. John's Wood protesting against the proposal to erect in Grove End Road and on either side of Warwick Place large blocks of dwellings for the working classes.

The British Institute of Certified Carpenters visited the engineering works of Mr. F. W. Reynolds in Blackfriars Road last Saturday. Specimens of various parts in joinery were put through the machines. One of the mortice machines had an arrangement at the side for boring, and by revolving the handle the chisel came into position, and by repeating again the core-driver was moved into place. A fire-wood splitting machine shown should come into use for lath rendering. A mortice machine for the box of carriage-wheels was inspected. By an arrangement at the side the box is divided into the number of spokes required, and the bed of the machine can be tilted to suit the side splay of the spokes. Many other appliances were exhibited.

Female Labour in the Brick Trade.—An experiment is being made by some of the brick-making firms in the Black Country with a view to the abolition of female labour in the brick trade. Such labour should never have been employed.

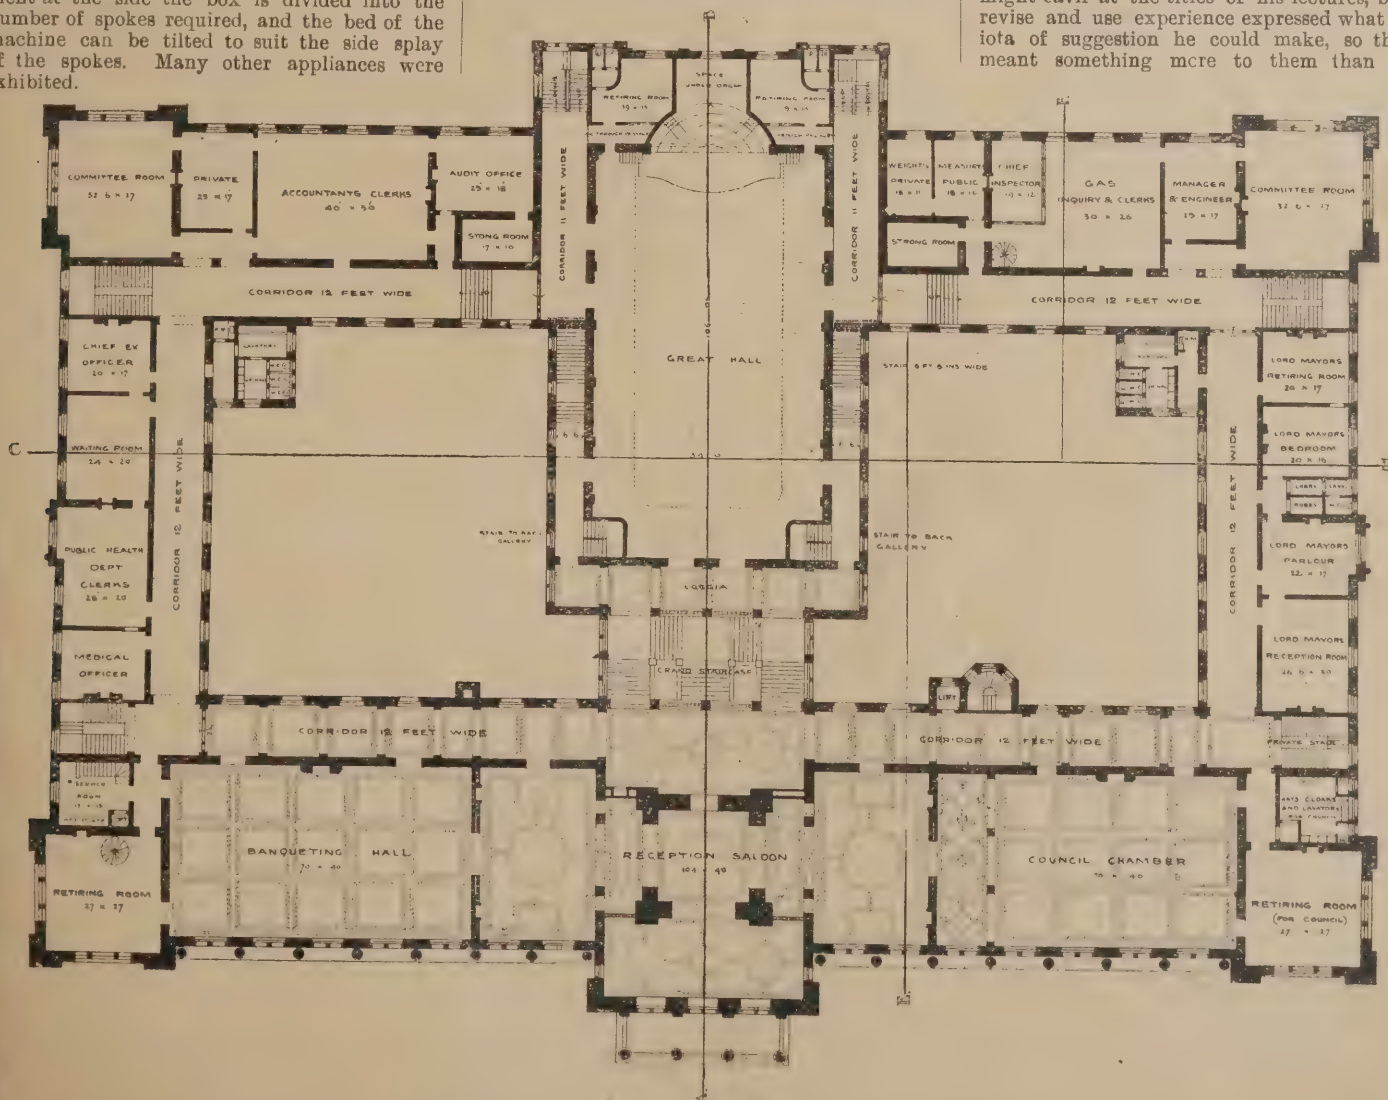

The Worcester Master-Builders' Association held its annual dinner recently, Mr. J. S. Wood presiding. Mr. J. Stokes in proposing "Success to the Midland Federation of Master-Builders" referred to the "go easy" doctrine. It had been elicited at Newcastle, he said, that during six years bricklayers' wages had increased 14 per cent, but the output had decreased 33 per cent. When he came into the trade he carried bricks, nine at a time, all day; now labourers took eight and stood five minutes between each journey. Thousands of ready-made doors were imported every year which could as well be made in England if the joiners would put their best days' labour into it. Builders were harassed by disputes among the workmen themselves. Bricklayers and plasterers said each were doing the others' work, and the masters had to measure the size of tiles to decide. The chairman proposed "The Architects," and said builders were desirous of seeing quantities forming part of contracts, and he hoped the architects would use their best endeavours in that direction. The Builders' Federation had now under consideration the general form of contract which they hoped will be adopted throughout the country. It would give the builders an opportunity of appealing when they considered they were unfairly dealt with. Mr. A. B. Rowe in reply said architects felt they were one with builders, because they naturally felt the stoppage of building owing to the strikes of men. The architects appreciated the many difficulties with which builders had to contend, and would as far as possible act fairly with them without detriment to their clients. The fluctuations of the labour market and the price of materials had rendered the lot of the contractor anything

but a happy one. With regard to quantities, the architect guaranteed them and should always see that they were included in contracts. Mr. Calkin, the city engineer, thought quantities should form part of every contract.

MR. ALFRED GILBERT'S ADDRESSES ON SCULPTURE.

MR. ALFRED GILBERT'S third address at the Royal Academy was to all intents and purposes a sermon with "Creation" for its text. Two great artists who seemed to him to him to come nearest to the worship due to the Viceroys of a great Providence were Phidias and Turner. In music and in other arts he might find individuals as strongly marked. But music, though a giant to-day, is but a baby in the history of art; and with architecture it could not be said that one master-mind built this or that famous cathedral—it was the work of many men all working to create for an end which they could not explain. Mr. Gilbert instanced Memling's work for the hospital of St. John at Bruges as that of a man impelled and spurred on to create by some unknown force working within him. Memling came back from the Burgundian Wars suffering from the plague, and when the sisters of the hospital had nursed him back to life he asked at once for his brushes and colours that he might offer the nuns "some little of my God's gift as a recompense for their kindness." He stayed with them six years, and accomplished those examples of handicraftship and mind that can only be described as stupendous, coming as they did from a rough, raw soldier.

In his fourth lecture—"Revise and Use"—Mr. Gilbert said that in six lectures of an hour each he could not teach practically what he had spent thirty years over, and in which he still found himself a child. Purists of language might cavil at the titles of his lectures, but to revise and use experience expressed what poor iota of suggestion he could make, so that it meant something more to them than mere

FIRST-FLOOR PLAN, DESIGN FOR NEW CITY HALL, BELFAST.

"repetition" of a subject. In striving for the school prize they should neither think they were made if they won it, nor hopeless creatures if they lost it, for the immature children of fifteen who carried off prizes were not actually in advance of older students; they were really running neck and neck, for cramming in Art was as hollow as that in Letters. Art appealed to individual natures according to how those natures were developed, and he instanced Burne-Jones and William Morris, both of whom were past twenty-three when Art called them seriously. Though no Michael Angelo or other great genius lived now, there was their teaching left, and this "experience" was for the students' revision and use. Mr. Gilbert said nothing could be more cheap than the chance designs of book covers and for *ex libris*, and he amusingly illustrated a chance design of this character. A fluke would never outlive their own judgment; it was the cap and bells, while will-design was the crown with points. But there was an intermediary state which he could only describe as *attendu*; something which gave pause; for no sculptor quite knew what would

was "Experience," and he impressed on the young sculptors and painters that each year, each cycle, would make them more and more respectful to the work that had gone before them. The students before him had advantages that were possessed by students of no other academy, and they had opportunities of seeing examples of every kind of work. They might, perhaps, think that the work of some of the elder men was misguided, but he advised them never to criticise without thought what others had done with experience. Mr. Gilbert confessed that when he was a boy he thought little of this one and that one—he thought only of success in competitions and exhibitions. But, perhaps because his efforts were untruthful, he never had the faintest phantom of a success until he was past thirty, and then it came to him by the recognition of a brother artist—Leighton. Mr. Gilbert urged the students to make more use of the splendid art library which was at their disposal, for it was always a reproach to the sculptor that he did not read books. There was Cellini's "Autobiography," for example—an epitome of an artist's experiences. Mr.

make something let him recall the way in which similar subjects had been treated by other men—the men who had made tradition. Some artists would say that when they were trying to realise a particular thing they could not bear to see other work—it upset their ideas. But, said the lecturer, nothing was better than for students to see work that had been done by greater men. They need not copy it, but they might gather inspiration from the tradition that its maker had passed on to them. Above all let them take no notice of fads or new fashions in art. These should be left to the amateur or to the cheap-Jack who was seeking a short road to a spurious reputation. Turning to ambition, Mr. Gilbert said that he was touching on the biggest thing of all. It was the stirrup-cup of life, sometimes poisonous and sometimes sweet. The artist's ambition should not be to vie with what had gone before, but to make himself worthy to be classed with those who had done the great work of the past. His ambition should be to hand down the best—to leave something behind him. Mr. Gilbert then referred to a matter of great interest to the sculptor—the

COTTAGES, ABERFOYLE, PERTHSHIRE. JAMES MILLER, I.A., ARCHITECT.

happen ten minutes after he had begun. Mr. Gilbert could not say of himself that he was a fluker, but maybe he was *attendu*. Then he evolved will-design from the line of beauty, showing how discord might arise, but by revising and using it this became design of harmony. A given theme always resulted in greater originality than one happened upon. A sculptor could not set up a model and decide afterwards what it should be called. It was the will that would live. Sculpture, said Mr. Gilbert, was almost as complex an art as that of the master-builder, and no scheme should be undertaken that could not be thoroughly digested, revising and using the experience by which it was to be carried out. They might think it was easy to have a lump of clay and make a mud-pie of it and then a human head. He granted it was easy to make a head of some sort even out of a potato (and there were many heads that were potatoes), but he wanted the students to approach their art with loving care of experience, revised and used, and then they might let the rest go.

The keynote of Mr. Gilbert's fifth address

Gilbert showed on the blackboard how one of his nurses taught him, when about five years old, to draw a child's head on a foundation of four circles grouped together. This, and other similar examples, which were sketched later on the blackboard, were, he said, homely teachings done to amuse a little child. But he might tell them seriously that he had inherited that tradition, and even now he could never draw a child's face without making those preliminary circles.

The title of Mr. Gilbert's sixth and last address was "To a Proper End." Memory, he said, was a great factor in conveying an artist's work "to a proper end," and he urged the students to keep all their beautiful memories before them while working, and close the door on all the rest. If the artist's memory were charged with fine things he would destroy his bad or ugly work, at once recognising that it was not the proper end of his achievement. Let the sculptor try for the best. If his work was not good—and he ought to be able to judge for himself—let him break it up or it would break his heart. And he must respect tradition; and when he was trying to

committee. The young sculptor who accepted a commission from a committee in the ordinary fashion might find that he was not allowed a free hand. But he must make up his mind not to submit. He was an artist giving the use of his brains, but he should not allow himself to be told how to use them. And even after thirty years of work the sculptor was liable to be told that he was wrong, perhaps by someone who knew nothing. In conclusion Mr. Gilbert told the students that it was impossible that he should have taught them the practice of sculpture in these lectures. He had explained to them before that his task was to guide, not to teach. But if he had made them think, and exhorted them—not vainly—to read, he should go away a happy man.

The Estate of the late Mr. Onslow Ford, E.A., has been proved at £10,720 gross and £8,270 17s. 9d. nett. To the Royal Academy has been bequeathed such of the plaster casts of his work as they might select for exhibition, but such casts are not to be sold or reproduced.

PRINCES PIER STATION, GREENOCK. JAMES MILLER, I.A., ARCHITECT.

LINEAR PERSPECTIVE.

At a recent meeting of the Associate Section of the Edinburgh Architectural Association (Mr. J. Stuart Syme in the chair) Mr. Robert F. Sherar, of Mr. Peter L. Henderson's staff, gave an interesting lecture on linear perspective illustrated by photography. After briefly tracing the history of the science from the conventional representations of the ancient Egyptians to the finished realism of the Middle Ages, he said that the researches in the science as such had been practically exhausted by Dr. Brook Taylor and successive writers in the eighteenth century; however, it was always possible to improve on the methods of stating facts and of teaching. The lecturer condemned the confusion of ideas expressed by the somewhat ambiguous term "picture-plane," and then discussed a few questions arising perennially from this confusion. Among these questions was that of vertical parallel lines converging towards a vanishing point as they receded from a spectator. Having proceeded so far in a critical manner, he then described the different uses and applications of the science as an aid to the architect or painter, and with the aid of photographs taken for the purpose he very lucidly described the elementary conditions on which the science depended and was distinguished between the perspective appearance of objects as seen and the perspective image as drawn on paper. He showed two photographs of the same building taken from the same spot which were quite different in the perspective lines, and explained that they were both equally correct records of the perspective appearance as we saw it, but records only. To prove this he then showed a photograph of the first of these two pictures taken with the camera placed in front of it, so that its image fell on the left-hand side of the photographic plate instead of the right-

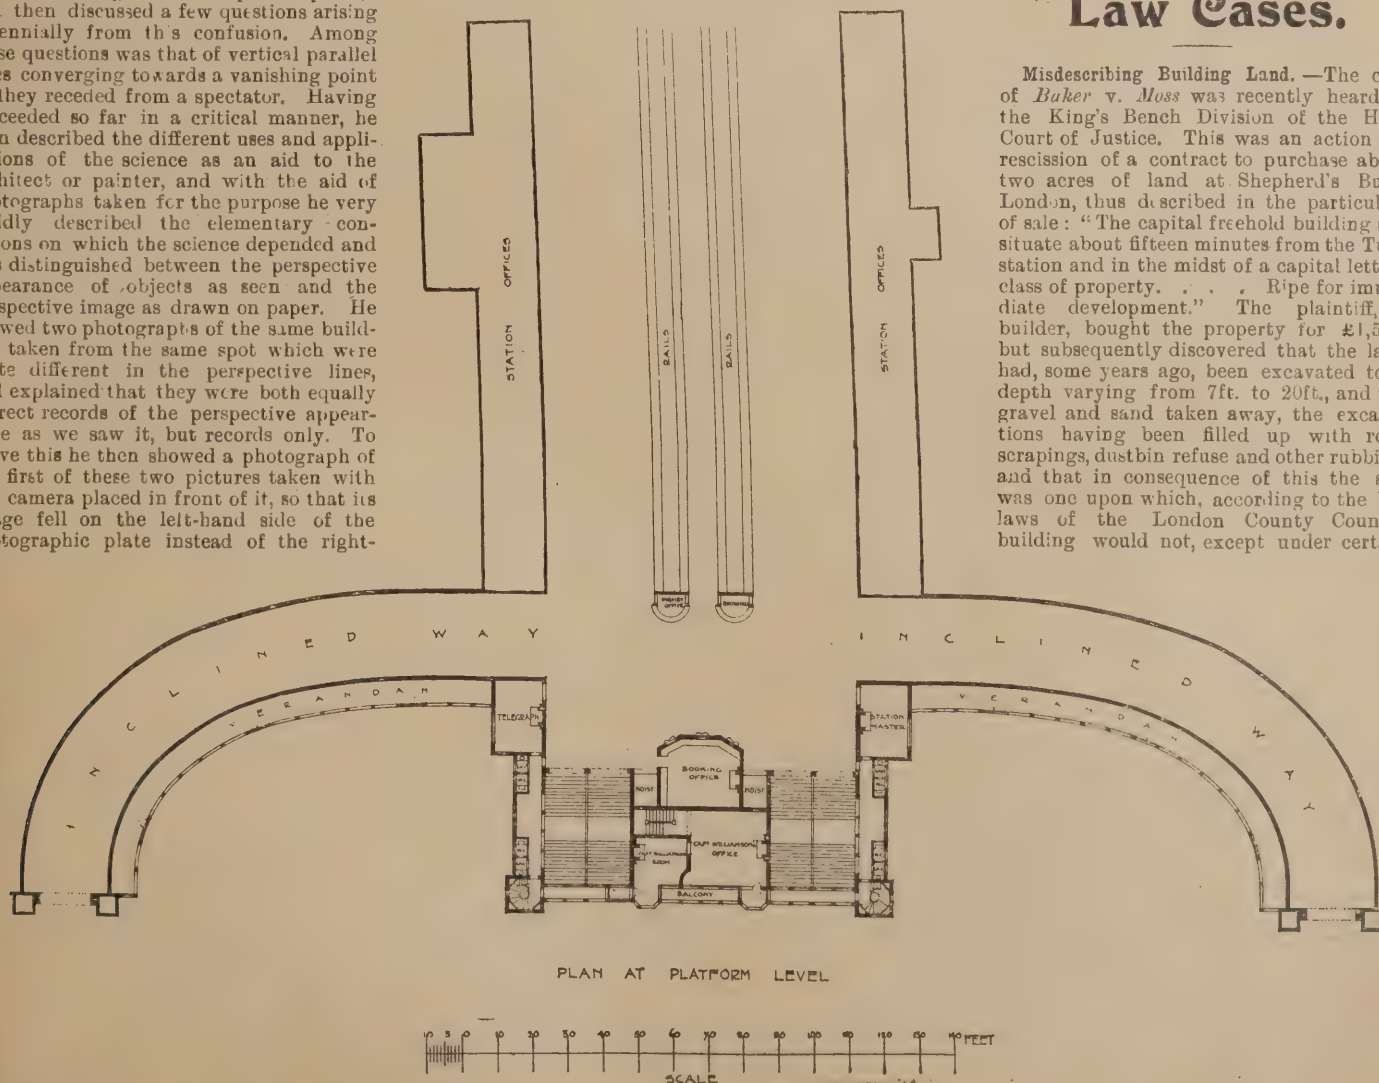

hand side, and the result was the same as the second picture. From this he laid down the rule that the perspective appearance depended on the position of the spectator, and on this only; and that the perspective image depended on the surface on which it was delineated, whether it was a picture-plane vertical or otherwise, or a picture curved as a panorama, &c.

In dealing with the distance a spectator should be from the object in order to produce an agreeable result, he showed three very interesting photographs of the east end of Princes Street with the Calton Hill in the distance, and said he had often heard it remarked that photography did not give correct perspective of distant hills, &c., as it always rendered them too small. The first photograph above referred to showed the Calton Hill about a quarter of

the height of the buildings, the second showed it the same height, and the third showed it twice the height. This, he said, all depended on the distance the spectator or photographer was from the objects to be represented. The choice of this distance was one of the most important preliminaries of picture-making, whether by photography or other means. He agreed with all the later writers on perspective that no rule could be laid down except in a general way in order to guide the artist, the conditions varying so much in each individual case. He laid great stress, however, on the fact that these conditions should be thoroughly understood, and said they were the very things that were not clearly defined in modern books on perspective.

Law Cases.

Misdescribing Building Land.—The case of *Baker v. Moss* was recently heard in the King's Bench Division of the High Court of Justice. This was an action for rescission of a contract to purchase about two acres of land at Shepherd's Bush, London, thus described in the particulars of sale: "The capital freehold building site situate about fifteen minutes from the Tube station and in the midst of a capital letting class of property. . . . Ripe for immediate development." The plaintiff, a builder, bought the property for £1,500, but subsequently discovered that the land had, some years ago, been excavated to a depth varying from 7ft. to 20ft., and the gravel and sand taken away, the excavations having been filled up with road scrapings, dustbin refuse and other rubbish; and that in consequence of this the site was one upon which, according to the by-laws of the London County Council, building would not, except under certain

conditions, be permitted. The defendant contended that the land was correctly described. The words used were understood to mean that, having regard to the state of the neighbourhood in which the land was situated, houses built on it could probably easily be let or sold. He further contended that, if the soil were excavated and proper foundations laid, the land could be used for building without contravening the by-laws of the County Council, and that the necessary excavations were no more than would be required for building basement houses on any ordinary land.—Mr. Justice Joyce said he had no hesitation in holding that there was in this case a most serious misdescription of the property. The land was practically useless for the purpose for which it was offered for sale, and for which the plaintiff bought it. The plaintiff was therefore entitled to the relief which he claimed.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Examination in Builders' Quantities.

BELFAST.—A. B. writes: "Where can I obtain the papers of past questions of examinations for builders' quantities promoted by the City and Guilds of London Institute?"

The questions set at the examinations of the City and Guilds of London Institute are published annually at about 1s. Apply to the Superintendent of Examinations, City Guilds Central Institute, South Kensington, London S.W. HENRY ADAMS.

Taking-out Quantities of Tracery Work.

BRADFORD.—J. P. D. writes: "Which is the best way to take out the stone and labour as per enclosed print of tracery and archstones (not reproduced)?"

The stone and labour should be taken out separately. The stone is measured at per ft. cub., taking the extreme size of the block out of which the finished piece would be obtained. Stone 3in. thick and less is measured per ft. super. and taken separately. The labours are best measured at per ft. super., taking to each stone the area of the bed and of one of the ends as "bed and joint," the superficial area of these including two faces to each, so that if it is taken to one face only the dimension will have to be halved. "Sunk joints" to the arch and "plain faces" should be stated. The mouldings are measured to their full girths. The circular convex and concave beds should be described as "circular bed or joint" and "circular sunk bed or joint" respectively. "Circular moulding" is used to describe either concave or convex. Take the trefoils separately. Number the mitres, stopping, &c., averaging the girths, and describe as "stopped." Number the dowels, including the mortices, and measure the grooves for glass per ft. run. A sketch must always be included in the quantities.

Arch over Fireplace Opening.

CO. KILDARE.—J. J. H. writes: "A fireplace is 3ft. 6in. between the jambs, and projects 14in. from the surface of the wall; the jambs are only 9in. wide on face. Would it be safe to turn over it an arch in two half-brick rings without an arch bar or stone lintel? The chimney breast would continue up to a height of about 20ft. by 5ft. wide."

It would not be safe to put an arch as suggested without a chimney bar, owing to a thrust, the small space available for skewbacks, and the narrowness of the jambs. HENRY ADAMS.

Liability to Repair.

BELFAST.—URGENT writes: "A has a twenty-five years' lease of a building which he uses as furniture stores: nineteen years of the lease have elapsed, during which period the owner (B) has not repaired the building, such repairs

being done by A. Owing to a settlement, or some other unknown cause, the rear wall of the building has cracked from the ground up to the eaves, and is in danger of collapsing. B says that as A has a lease of the building he will have to repair the wall. Is A liable for this, or only for all reasonable repairs over which he has control?"

In the absence of any stipulations respecting repairs in A's lease, A would be bound at the expiration thereof to deliver up the premises to the owner in the same condition as that in which he received them, reasonable wear and tear alone excepted. From the nature of the injury mentioned, and bearing in mind the suggestion querist makes that it is owing to a settlement of the ground, it is very probable that it existed in a minor and possibly not so noticeable a form at the time querist leased the house. If that were so, he is not bound to repair the damage; otherwise I am afraid that the owner may allege that the injury to the wall of the house was caused by the use querist made of the house or by some neglect on querist's part to have proper repairs executed. If the owner takes this position, querist will find it difficult to succeed against him, unless he can show that the crack in the wall arose from some cause which is outside querist's covenant to keep in good order. If querist will send me a copy of his lease, and tell me a little more definitely what is the cause of the cracking of the wall, I will advise him further. W. JOHNSON ROBERTS.

Ascertaining Quantity of Lime in Mortar.

BRACKFORD.—J. P. D. writes: "Kindly suggest an approximate method of ascertaining the quantity of lime in mortar for use on works in progress in lieu of the elaborate one of analysis by a chemist."

Lime is usually mixed with sand for mortar in the proportions of 1 bushel to 3, but the only accurate method we can suggest is to compare the quality of the limes (tested as described on p. 168 of our issue for October 16th last) with a standard one and use a proportionate amount in the mortar to that decided for the standard lime. Tests of all the best-known limes can be obtained from the text-books, and you can proportion them for the work in hand from the binding strength assumed in calculating the dimensions of the brickwork.

Claim for Defective Drainage Work.

YORKSHIRE.—KMORTS writes: "A. has some property which he required to convert into cottage property. Plans were prepared by the architect B., and the tender was let to contractor C. In the specification there is a clause which states that the lengths of the 4in. and 6in. drains are to be laid with clay joints and collared with cement outside the clay. This was done by the contractor C. and approved by the architect. About two years and six months after, A. engaged the contractor C. again, but refused to pay for the work then done on the ground that the drainage of the cottage property was defective. This he discovered by forcing water into the drain excessively. A. claims against C. for defective workman-ship, but C. disclaims all liability, as he says the work was done under the architect B., whom he considers is liable, if anyone is, as he specified clay joints collared in cement, which, in this case, have proved defective. Is the contractor right in his contention? He has sued A. for payment of his account and A. has put in a counter-claim."

I think the contractor has a just defence to any action brought against him by either the owner or the architect. He appears to have carried out the work in accordance with the specification and to the satisfaction of the architect. More than that, he was paid by the owner the full amount of his contract and extras. I certainly think that two years and six months after work has been passed and paid for is not the time to raise objections as to its quality. I do not see how the owner could set off or attempt to set off as against the contractor any claim, be it valid or otherwise, which arose in respect to an entirely different transaction. On the hearing of the action, the contractor should strongly object to the owner's case being heard by way of counter-claim. If the owner imagines he has any claim against the contractor he can proceed against him by separate

action. The work having been done by querist according to specification, to the satisfaction of the owner's architect, being paid for, and having proved satisfactory for nearly three years, I cannot see how failure to stand the "test" mentioned (which in all probability caused the injury complained of) gives the owner any right of action. If the case is properly put before the judge, I fail to see how the owner can recover one penny. W. JOHNSON-ROBERTS.

Height of St. Paul's Cathedral.

LONDON, S.E.—G. A. A. writes: "What is the height of St. Paul's Cathedral (a) from the pavement level to the top of the cross, (b) from the foot of the foundations to the top of the cross, and (c) from the pavement level to the top of the external dome?"

(a) 370ft. (b) We do not know the depth of the foundations. (c) 285ft.

Rendering Partition Noise-Proof.

LONDON, W.—G. J. M. writes: "How can a matchboard partition lined with sawdust be made noise-proof? It is not so at present."

We advise you to remove the sawdust from the partition and fill it with slag wool, and put two thicknesses of heavy canvas on each side.

Cleaning Marble Slab.

HEXHAM.—WESTFIELD writes: "How can I clean a marble slab in a butcher's shop window which has become stained?"

Brush the surface with strong hydrochloric acid, commercially known as muriatic acid or spirits of salts.

Perspective.

TORQUAY.—E. C. writes: "What book on architectural perspective do you recommend for a beginner? I want a cheap one."

"Linear Perspective," by G. A. T. Middleton (B. T. Batsford, 1s.).

In reply to "C. L. G.," who sends a similar enquiry, a series of articles on perspective appeared in our issues for October 28th, 1896, November 4th, 1896, March 3rd and 17th, 1897.

Cloth for Vapour Bath.

LANCASTER.—A READER writes: "I have been asked to make a vapour bath, but do not know with what material to cover the framework. Can you suggest something?"

The cloth used is a heavy canvas treated with a composition similar to that used for making oilcloth. It can be obtained from Messrs. Piggott & Co., Bishopsgate Street, E.C. There are also several other manufacturers of these cloths for vapour baths.

Japanning Stoves.

BIRMINGHAM.—HAMSTEAD writes: "Kindly give the name of a book on the construction of japanning stoves and small brazing hearths for use in a hardware factory. Is there any useful article on the subject?"

We do not know of any book on japanning stoves or brazing hearths, but Spon's "Workshop Receipts" contain articles on japanning and brazing.

"The Tower of the Winds."

LONDON, W.—H. S. writes: "Kindly mention a book dealing with the Tower of the Winds at Athens."

Stuart and Revett's "Antiquities of Athens."

Young's Modulus.

MAC writes: "In the Board of Education syllabus for Building Construction—Advanced stage—it is stated that the student should know Young's Modulus. Where can I find information about this?"

Young's Modulus is variously called the modulus of longitudinal extensibility, the stretch modulus or the modulus of elasticity. The latter is the more usual name used by engineers and is the constant E used in formulæ. It is explained in Vol. IV. of Rivington's "Building Construction," Ewing's "Strength of Materials," and Rankine's "Manual of Civil Engineering."

GLASGOW INTERNATIONAL EXHIBITION, 1901: THE INDUSTRIAL HALL, JAMES MILLER, I.A., ARCHITECT.
COLOURING--WALLS, WHITE; ROOFS, RED; DOMES, GOLD; WOODWORK OF SHUTTERS, SASHES AND ASTRAGALS, BRIGHT GREEN.

Bricks and Mortar.

APHORISM FOR THE WEEK.

If a town is old, however poor, it is sure to have some beauty or interest; if new, we look for neither, but get out of it as soon as we can.—J. J. STEVENSON.

Our Plates.

THE works in connection with Colney Hall, Norwich, which are now nearly complete, consisted of the re-arrangement of the interior, together with the addition of a large wing at the north-west end which is not seen in the illustration, and a wing at the east end consisting of a conservatory with billiard-room behind and rooms over. The house was an uninteresting and somewhat poorly-built example of the class of work in vogue at the beginning of the last century and was stuccoed all over in imitation of stone and painted pink. The two bays shown on either side of the front door are new, as are the stone rusticated piers of the house and the stone cornice and balustrade. The house itself has been entirely refaced to match the new brick-work, and the new additions have been carried out in red brick and Bath stone, the bricks themselves being obtained from Cossey in Norfolk. Other works in connection with the property generally comprise alterations to the stables, a new engine-house and power-house for the electric light, and a boat-house on the river-bank. The whole has been carried out from the designs and under the superintendence of Mr. Arthur C. Blomfield by Messrs. J. Youngs & Son, of Norwich, the clerk of the works being Mr. F. Comport.

Modernizing Nuremberg.

WRITING in the "Morning Post" recently Mr. Francis Watt said:—Disillusion, appalling in its completeness! That is your first, nay your second, impression of Nuremberg. A monstrous railway station, clamorous and ugly as Clapham Junction. Outside, great, broad, fine streets, the exact pattern of those in every other prosperous German town; spick and span shops crammed with the latest fashion in everything; electric trams with overhead wires rushing at breakneck speed in all directions; dotted around are great chimney shafts doing so prosperous a business that the sky is heavy with their smoke. Such is "The quaint old town of toil and traffic, Quaint old town of art and song." What strikes you most is the frightful newness of everything. Not here, as in Bruges, do you get whole streets of mediæval houses. No; you must reconstruct your Nuremberg, as palæontologists do extinct animals, from stray fragments.

The Academy Prize.

THOUGH the present is an "off" year at the Royal Academy Schools a long list of prizes is offered to the students. The biennial medals and scholarships will not be offered again until 1903, but the prizes to be competed for in the present year include a large number of silver medals, as well as awards in money amounting altogether to about £450. The chief prize this year is that of £40 for design in water-colour or tempera for the decoration of a portion of a public building. If the design is of exceptional merit the student is afforded an opportunity of carrying it out at the expense of the Academy. A sum of £4 a week is allowed to the prize-winner while the work is in progress, and several large pieces of mural decoration have been carried out under these conditions in the refreshment-room at Burlington House and in the nurses' refectory at Guy's Hospital. The subject set for the present year is "Dawn." The subject for the cartoon of a draped figure is "A Sibyl," and the two prizes offered for design in architecture are "A Picture Gallery for a Country Town" and "A Formal Garden."

Tavistock Parish Church is proposed to be repaired from plans by Mr. G. H. Fellowes Prynn, F.R.I.B.A., at a cost of about £1,000. The whole of the floor, throughout the nave and aisles is more or less infected with dry rot. The floor is proposed to be renewed from end to end, and a system of ventilation arranged. The roof also requires attention. The carved bosses and external lead gutters will be attended to.

Keystones.

A New Fire Station at Greenwich has been built at the junction of Tunnel Avenue and Horn Lane with Lower Greenwich Road.

The Devon and Exeter Architectural Society held a meeting at Exeter on February 28th last, when a paper was read by Mr. A. S. Parker, A.R.I.B.A., of Plymouth.

Tenby Borough Surveyorship.—More than forty applications were received for this post, and among them was that of Mr. H. T. Morley, who resigned the position in 1895 after holding it for twenty-two years. This has aroused considerable local feeling.

"Structural Colour Decoration of the Interior of Public Buildings."—Owing to the great pressure on our space we are reluctantly obliged to hold over till next week the paper with this title which Mr. Gerald C. Horsley read before the Society of Arts on March 4th.

Mr. Edwin O. Sachs will on Thursday, March 13th, lecture before the Society for the Encouragement of the Fine Arts on "Artistic Electric Illuminations" having special reference to the impending Coronation. The lecture will be given at the Galleries of the Royal Society of British Artists, Suffolk Street, Pall Mall, at 8 p.m.

New Baths at Leeds.—The Leeds Corporation Baths Committee have accepted the prize design of Mr. J. Lane Fox, Leeds, for the baths proposed to be erected at Bramley, and he has been asked to prepare working plans in order that the work may be proceeded with as early as possible. The estimated cost of the buildings is £8,000.

Liverpool Queen Victoria Memorial.—The Committee have selected the design of Messrs. C. J. Allen, F. M. Simpson, W. E. Willink and P. C. Thicknesse. It consists of a statue of Her late Majesty, which is to be of heroic size and of bronze, to be placed on a pedestal, under an Ionic stone canopy. The dome will be supported by sixteen pillars, and after nightfall will be lit up by electricity. The total height of the memorial will be about 30ft.

The T-Square Club held a ladies' concert last Wednesday at Covent Garden Opera House. The band of the Coldstream Guards played numerous selections during the evening, and contributions were given to the programme by Miss Elsie Southgate, violinist; Miss Margaret Ormerod, soprano; and Miss Fanny Wentworth, the well-known drawing-room entertainer. Mr. Lemprier Pringle gave three excellent songs; Mr. Herbert Harvey a musical sketch; and Mr. J. O'Gorman told some amusing Irish stories. The honorary secretary of the club is now Mr. F. Coleridge Simpson, 99, St. Martin's Lane, W.C.

"Paris in London," this year's exhibition at Earl's Court, will be opened early in May by the Lord Mayor, Sir Joseph Dimsdale. Apart from the French Industrial Section, a French Fine Art Section has been organised. The familiar buildings and grounds at Earl's Court will this year undergo considerable transformation. The Queen's Court, with its elaborate Indian architecture, will give place to a representation of the most notable palaces of the great Paris Exhibition, while the part of the exhibition known as "Old London" will undergo complete transformation. On the site will arise a "Picturesque Paris," including a new structure resembling the Summer theatres in the Champs Elysées.

The Dry Rot Fungus was the subject of Mr. Summerville's recent lecture before the Architectural Section of the Royal Philosophical Society of Glasgow. He pointed out that dry rot was a disease of civilization, and was only found in and around dwellings and other buildings of man; it had never been found in the forest. The conditions favourable to the growth of the fungus were moisture and a warm, still atmosphere. As to its prevention and cure, the foundations of buildings should be so arranged that no water or moisture be allowed to accumulate near them, and buildings should be so ventilated as to keep the foundations and other parts of buildings dry. Wood for fittings should also be dried before being used, and sound-deadening materials should be thoroughly sterilised.

Mr. Arthur Marshall, A.R.I.B.A., of Nottingham, has been appointed by the Stourbridge Board of Guardians as architect to the new workhouse and cottage homes.

The Arthur Cates Prize is a new prize added to the R.I.B.A. list for this year (see p. 20 of our issue for February 26th); it is founded more especially in relation to the application of geometry to vaulting, stability of edifices, and design. The Godwin Bursary has been increased in value from £10 to £65.

Fulham's New Baths.—The members of the Institution of Junior Engineers paid a visit recently to the new baths and washhouses of the metropolitan borough of Fulham in Melmoth Place, Fulham Road. The architect, Mr. H. Dighton Pearson, A.R.I.B.A., showed the members over. Mr. Charles Wall, of Chelsea, is the builder, and his contract is for £42,953. The engineering, electric lighting, well-sinking and pumping machinery cost £15,000.

A New Nazareth Home at Lancaster has been erected at a cost of about £15,000 in Ashton Road for the Order of the Sisters of Nazareth, whose headquarters are at Hammersmith, London. Provision is made for 250 destitute children. The buildings are in the Tudor style, with mullioned and transomed windows. The following were the contractors:—Masons, B. Graham & Sons, Huddersfield; carpenter, T. Hird, of Keighley; joiners, Messrs. J. Hatch & Sons, of Lancaster; slaters, Messrs. Hill & Nelson, of Morecambe; plasterer, O. Lister Ilkley; plumbers and electric lighting, Messrs. Calvert & Heald, of Lancaster; heating, Messrs. Dilworth & Carr, of Preston; cooking appliances, Messrs. Newton, Chambers & Co., of Manchester; and laundry fittings, Messrs. Bradford & Co., Salford. Messrs. Austin & Paley, of Lancaster, were the architects.

New Patents.

These patents are open to opposition until April 12th.

1901.—Cleaners for Gulleys, Pipes, Traps, &c.—2,653. G. B. WILSON, Brierley, near Barnsley, Yorks. The cleaner consists of a dished scraper pivoted at the end of a rod and capable of being operated by the handle of a second rod which passes up through the main one.

Moistening Air in Factories, &c.—5,678. G. RICHTER, Mildenau, Bohemia, Austria. Air is forced through a nozzle in a water-tank, thus sucking up water through two small pipes attached to the nozzle and delivering it in very fine spray or mist.

The following specifications were published on Thursday last, and are open to opposition until April 19th. The names in italics are those of the communicators of the inventions. A summary of the more important of them will be given next week.

1900.—20,219, SHONE & AULT, ventilating and flushing drains. 20,358, HART, ventilating with filtered, cooled or warmed, and moistened air.

1901.—3,382, HOLWILL, manufacture of tiles. 4,657, STEIGER, manufacture of cement. 4,912, MITCHELL, saw-set. 5,094, TREWBY & BIGGART, apparatus for clearing ascension pipes of gas retorts. 5,313, LEES, LEES & LEES, guides for band-sawing machines. 5,918, STEWART, gully traps. 6,312, DOULTON, water-supply valves for closets. 7,521, GARDNER (*Cady*), chains. 7,522, GARDNER, chains. 10,851, MOORE, windows. 13,890, CROSSE, wooden panels, linings, &c. 15,443, GHYS, door or window catch. 17,608, WATTS, valves. 19,648, HOUGHTON, firebricks for domestic grates. 20,864, PARRY, regulating air, heat and combustion in domestic grates. 23,277, KOPPERS, construction of coke ovens by means of a specially-shaped stone. 23,548, JØRGENSEN, window frames. 24,181, INGLIS, chimney pots. 25,113, VAN DUYL, protecting water pipes or conduits against frost. 26,109, JOHNSON, adjustable scaffolds for use upon chimney stacks. 26,153, JACOBS, tunnels.

1902.—438, WALL, locking taps. 475, THOMPSON (*Sosna & Sosna*), saws. 934, EICKHOFF, sink trap.

 ROYAL INSTITUTION.—Geheimrath Prof. Otto N. Witt, Ph.D., F.O.S., on "Recent Developments in Colouring Matters," 9 p.m.

The Architectural Association of Ireland held a meeting on March 4th, Mr. R. M. Butler occupying the chair. Mr. Marmaduke Purcell, M.I.C.E.I., lectured on "Chemistry in its relation to the Arts."

The bricklayers' labourers at Vickerstown, Walney, last week demanded an increase of 3d. per hour, making their wages 7d. per hour. Some of the sub-contractors granted the increase, the men resuming work. Other masters, however, refused the terms, and their men have left work.

Mr. Richard Veevers, J.P., late of Preston and Fulwood, died recently at his residence, Oakhill, Windermere, at the age of eighty years. He was engaged as an architect up to ten years ago, when he retired, in the firm of Myres, Veevers & Myres, of Chapel Street, Preston. He was apprenticed to Mr. William Lamb, agent for the Duke of Hamilton at Hay Carr, to be taught "the art, mystery and profession" of a land surveyor. His time expired in May, 1842. In 1847 he entered into partnership with Mr. John James Myres, of Preston.

THE DREAD DISEASE

of Small-pox still retains its hold on London, despite all the efforts which have been made to stamp it out. Every reader in the Metropolis should

INSURE AGAINST IT

by adopting our Insurance Policy No. 3.

These are the three Schemes:—

- (1) *A Free Accident Insurance of £500 to every regular reader of our paper.*
- (2) *An Accident Insurance of £500, and also £250 for Permanent Total Disablement. £2 10s. per week for Temporary Total Disablement. Premium, 1/-*
- (3) *An Accident Insurance of £1,000, with the following special additional advantages: £500 for Permanent Total Disablement. £6 per week for Temporary Total Disablement. £1 10s. per week for Temporary Partial Disablement. £30 Annuity. £3 per week during confinement from such illnesses as Small-Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c.*

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

Ordinary Risks, Premium, £3/-
 Hazardous Risks, Premium, £3/10/-

Write for Proposal Form.

These Insurances are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

SPECIAL NOTICE.

- (1) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.
- (2) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.
- (3) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.
- (4) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.
- (5) In applying it is only necessary to write a postcard, giving the full name and address of the newsagent from whom the copy is obtained.

A Pamphlet, giving full details of the THREE SCHEMES will be sent on application to
 THE MANAGER, BUILDERS' JOURNAL,
 EFFINGHAM HOUSE, ARUNDEL ST.,
 STRAND, W.C.

Royal Academy Exhibition, 1902.

The receiving day for architectural works is Thursday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors and to forward them (free of expense) to Burlington House. In order that careful reproductions may be made for publication, it is requested that drawings be sent as early as possible. No drawings can be received by us later than noon on the sending-in day.

An Architectural Causerie.

Theatre
Architecture.

THE announcement that Mr. William Archer and Mr. Edwin O. Sachs are collaborating to produce a Blue Book on national, municipal or otherwise endowed theatres makes one think of the possibilities of theatre architecture and of those gaudy representations and finicking decorations which are so characteristic of the modern theatre architect. When any complaint is made the architect excuses himself on the score that he is only supplying what the proprietor demands, and the latter—should he not approve the scheme, which, however, he generally does—puts forward the plea that he is only satisfying the public taste; the result of all of which is that our theatre architecture is very insipid. That a fine effect is obtainable without barbarous and crude decoration can be seen at Mrs. Langtry's new theatre (to cite a recent example and one, be it noted, admired by the public); yet the majority of playhouses, and particularly the music-halls, are utterly vulgar in treatment. It is true that a building devoted to such purposes can legitimately claim a greater freedom in its decoration, but even madness has its method; and there is no necessity to gild and plaster with tawdry ornament every nook and crook till the eye tires of the disorder.

The new Whitworth Hall which has been added to Owens College, Manchester, was opened last week by the Prince and Princess of Wales. "The absence through illness of the architect," said the Prince, "is a matter of regret to all of us." The Hall proper is 65ft. high and occupies the upper storey, the ground floor comprising a number of rooms about 18ft. by 17ft. intended for various purposes—chiefly for examinations. The oaken roof of the hall, which is of modified "hammer-beam" construction, is particularly rich. The principals rest upon granite columns between which are the windows, the hall being lighted on both sides. The side windows, like the great window at the south end, are filled with coloured glass. The two south towers, in order that they should not vie unpleasantly with the tall tower—so

familiar a feature of the college—have been kept down to 100ft. from the pavement. The stone used—Minera stone—is the same as that employed in the rest of the college buildings. Mr. Paul Waterhouse has been mainly instrumental in carrying out his father's design.

American Brick-
laying Methods.

OUR latest lesson from the Americans is in the art of laying bricks quickly—1,800 and more per man per day, not the usual 400 odd of the average bricklayer or the 330 of the London County Council. Mr. Stewart, the building manager of the Westinghouse Company, tells how this is being done at the new engineering works in course of erection at Manchester: and, moreover, he takes pains to make it clear (see p. 67) that the bricks are being laid by British workmen belonging to the trade-union. And wherein lies the secret of this success? Good wages, intelligent supervision and modern labour-saving appliances are mainly responsible. Though the benefits of such methods have been

proposed shall (if desired) govern the conduct of future competitions. Most important among these is the proposal to appoint two assessors in every case involving special experience or where the cost exceeds about 20,000/., one assessor to judge the merit of the designs as architecture and the other to employ his special knowledge of the requirements for baths, hospitals, halls, &c.; while a third assessor is suggested as umpire if needed. It is further proposed that the Institute shall fix a scale of fees proportionate to the work done by the assessors, the payments to be made to the Institute, who would reward the assessors according to scale. There can be no doubt that assessors are often appointed who, though they be excellent architects in general, have no special knowledge of the work they are set to adjudge; the planning of hospitals, for instance, cannot properly be judged by a man who has never undertaken such work; and, *vice versa*, an architect may be thoroughly conversant with planning and yet be a bad judge of architecture; so that in many cases

WHITWORTH HALL, OWENS COLLEGE MANCHESTER.
ALFRED WATERHOUSE, R.A., AND SON, ARCHITECTS.

set forth over and over again, we do not readily adopt them here; it is the old conservatism by which masters persist in antiquated modes and men prefer to waste time on work which could be done three times as quickly by mechanical aids; a conservatism which permeates every trade and business and is manifest on highway, field and river, so that the navvy digs when a machine might do it for him, and the boatman on the reaches of the Thames bails out all day with an old tin when the water might be removed ten times as speedily by a rotary hand-pump. In building operations the race is to the swift, and the cheapest market draws the best prizes. Whether we like them or not, these are the conditions of to-day, and we must either comply with them or go to the wall: or rather, as regards bricklaying, we must go to the wall and there comply with them—to employ a paradox.

Competition
Assessors.

THE reversal of Mr. Norman Shaw's selection as assessor in the Chelsea Public Baths competition has determined several leading architects, combining with the Royal Institute, to formulate some new regulations which it is

the appointment of a second assessor would undoubtedly be advantageous. One fact is very obvious—two assessors will cost more than one, and, however desirable they be, it is probable that the competition promoters will more often than not lean to the side of less expenditure and risk the finer selection: and the proposal to abolish the first premium does not improve matters, for it is now almost always merged into the commission and cannot therefore be transferred to the second assessor's pockets. Therefore, whatever scheme is proposed, the fact remains that more money will need to be spent if two assessors are appointed: and it is a question whether many competition promoters will be prepared to pay three hundred guineas instead of half that sum for an advantage which is more patent to architects than to the average committee man. What appears to us to be in more urgent need of reform is the practice of overriding the assessor's decision, and if the Institute could succeed in stipulating that the committee absolutely bound themselves to uphold the assessor's award they would be removing a great stigma now attaching to the conduct of public competitions.

ROYAL SCOTTISH ACADEMY.

THE ARCHITECTURAL EXHIBITS.

THERE is a certain amount of pleasure in surveying the architectural section of the Royal Scottish Academy this year, there being an indication of improvement in the general appearance of the drawings, which do not look quite the medley of former years. Much praise is due to the Hanging Committee for the manner in which the exhibits are arranged on the walls and the selection of the best works for the central positions. The hanging of the water-colour and architectural drawings in the south room has for some considerable time been a bone of contention between the artists and the architects, and this year another experiment has been tried in hanging a few of the architectural drawings intermixed with the water-colour and black-and-white works in the small octagon. The arrangement has this to commend it, that it brings the architectural drawings more under the notice of the public, and this may induce architects to pay more attention to the draughtsmanship of their drawings, which has been sadly lacking in the past.

Mr. H. J. Blanc, R.S.A., sends three works. His "New Carnegie Baths and Gymnasium," No. 755, and "Extensions of Jenner & Co.'s Premises," No. 757, are both excellent designs, and indicate how a skilful architect can obtain a pleasing effect on broad lines and at little cost. His "New Pulpit and Canopy for the Coats Memorial Church," No. 570, is a delightful piece of work in Mr. Blanc's best style—the drawing, in its way, is quite as interesting as the design, being a very crisp piece of pencil work with delicate colouring, the lower portion being kept darker to enhance the appearance of the pulpit. One seldom has the opportunity of seeing a better drawing, and on this account it is to be regretted that the draughtsman's name does not appear. Mr. G. Washington Browne, R.S.A., is represented by three drawings in the name of the firm—Peddie & Browne. All are large studies for facades, presumably to *fin. scale*. No. 759, "Insurance Company's Buildings, Leeds," is perhaps the most interesting, being Spanish Renaissance in style. No. 750 is for a similar type of building at Dublin which is more broadly handled, but the Florentine treatment of the ground floor appears weak under that of the English Renaissance of the upper floors, notwithstanding the broad mass of wall-surface through the openings. In general grouping No. 754, "Stirling Station Buildings," has a strong resemblance to the central portion of the Wolverhampton Public Library; in style it is Elizabethan, with a central gable flanked by squat octagonal turrets corbelled out at the first-floor level; the central gable appears out of scale and mars an otherwise interesting design. Mr. A. Marshall Mackenzie, A.R.S.A., sends two drawings, No. 660, the tower of "New Greyfriars Church, Aberdeen," the design for which is decidedly original and interesting as a free treatment of Perpendicular Gothic. No. 557, "Kingseat Asylum, Aberdeen," is a good wash-drawing illustrating in a bird's-eye view the villa type of asylum for the insane poor, somewhat after the type of Alt Scherbitz, near Berlin; the various blocks are of pleasing design. Mr. John Kinross, A.R.S.A., sends interior elevations and a sketch of "Tea Room at Buxley" for Sir James Millar, Bart., No. 656. The subject being of little importance, the drawing hardly merits the position it occupies. Mr. J. J. Burnet, A.R.S.A., exhibits two elevations of his "Competitive Design for National Bank Buildings, Glasgow," No. 753. The treatment is very effective, being in a French phase of Later Renaissance.

Of church architecture there is little of importance. Mr. Alexander N. Paterson's "Dunkeld Cathedral," No. 655, is a large drawing showing the interior view as proposed to be restored; small plans are attached showing present and proposed arrangements, also a small sketch of the present interior; judging from these, the alterations will be a great improvement, and Mr. Paterson is to be congratulated on the work. Presumably the traceried east window without cusping is an existing one and on that account is to remain, but it is hardly in keeping with the remainder of the work.

"BRAHAN," PERTH: FIREPLACE IN HALL. BEDFORD AND KITSON, ARCHITECTS.

Messrs. Brown & Watt's "Beechgrove U.F. Church, Aberdeen," No. 544, is a dignified piece of work with lofty tower and spire. The style adopted is Early English rather freely treated, but for this it loses nothing in quality; the plan is of the cruciform type now becoming general amongst the better class of Scotch churches. The belfry stage of the tower is placed entirely above the ridge-level of the main roof, and being detached from the nave it gives considerable dignity to this portion of the work. Mr. P. Macgregor Chalmers's "Sketch Design for Forres Parish Church," No. 566, is hardly in his best style, the tower and spire appearing top-heavy and out of scale with the remainder of the work. Messrs. Stewart & Paterson's "Broomhall U.F. Church, Glasgow," No. 651, is a work in the Decorated style, the general effect of which is somewhat squat.

Of school buildings there are only three examples. Mr. G. P. R. Young's "Central District School, Perth," No. 543, is a broadly-conceived building of three floors and is illustrated by a good pen-drawing by Mr. A. McGibbon. The design is praiseworthy, the effect dignified, and appears to have been obtained at little extra cost; the central portion projects slightly in advance of the general wall face and is further emphasized by moulded stonework around the windows, the sides being kept studiously plain; the lower storey is entirely of rusticated stonework, the upper being in plain brickwork with rusticated stone angles, and the whole surmounted by a well-proportioned cornice. Had a small plan been attached it would have given additional interest to the drawing. Mr. Thomas T. Paterson sends his "King's Park Burgh School, Dalkeith,"

"BRAHAN," PERTH: HALL AND STAIRCASE. BEDFORD AND KITSON, ARCHITECTS.

No. 746. The design is overcrowded with gables and otherwise too fussy to be entirely satisfactory for a school building: moreover, the drawing is hung too high for close inspection, but appears to be well executed in wash. Mr. William C. Laidlaw's "Leith Nautical School," No. 666, is illustrated by plans, elevation, sketch view and a detailed sketch of the main entrance. The design is weak and generally uninteresting, the sketch view showing the unsatisfactory position of the roof lantern, which, however, looks very well on the elevation.

As there were so many competitors for the Hawick Public Library and the result was considered so very unsatisfactory at the time, on account of the assessor's award being discarded, one turns with interest to examine the selected design, No. 563, by Messrs. J. N. Scott and A. Lorne Campbell. The other three hung are No. 657, by Mr. Edward C. H. Maidman; No. 654, by Mr. G. Mackie Watson; and No. 658, by Messrs. Findlater & Murray.

Mr. J. Macintyre Henry exhibits two works, No. 649, "The Gibson Craig Memorial Hall, Currie," the entrance front of which is over-elaborated while the sides are painfully plain. No. 665, "Dunkeld House, for his Grace the Duke of Athole," is a sad indication that even Dukes are seeking cheap buildings. The title of the drawing rather overpowers the design, which, however, is simple and fairly satisfactory. Both exhibits are crude examples of pen work. Mr. R. S. Lorimer's "St. Andrews, Halsington, Finland," No. 650, is a large dwelling-house with office attached, a pleasing group rather Flemish in feeling.

Other drawings worthy of attention are "Cardon, Mortonhall Road, Edinburgh," No. 571, by Mr. Thomas T. Paterson; "Fawside Curriemuir, Colinton," No. 661, by Edward C. H. Maidman; "Drawing-room, Warden House, Coldingham," No. 653, by Mr. James Jerdan (an effective water-colour hung too high); "Proposed House at Findon," No. 652, by William Beattie-Brown, junr., well illustrated by plans, exterior and interior sketches, and a pleasing design of the cottage type; "Hillside, Corstorphine," No. 662, a well-grouped dwelling, though the drawing does not do the design justice; "Waverley House, Gullane," No. 740, by Mr. John Breingan; "Design for a City Club," No. 667, by Mr. J. A. Arnott, a dignified composition; and "Competitive Design for Queen Victoria Memorial for Liverpool," No. 572, by Mr. J. Duncan Rhind.

Mr. T. P. Marwick sends a large plaster model of "New Premises for the National Bank of Scotland, Trongate, Glasgow," No. 631. The building is of four storeys with two attics, and is exceedingly effective. The details are English Renaissance of the seventeenth century, but the general disposition of the openings above the second floor do not coincide with those beneath, almost suggestive of Spanish influence, though all the openings on plan are placed equidistant from the centre of each facade. The windows which come partially under the projecting angle-turrets are a weak feature in the design.

Models of buildings having much detail are certainly to be encouraged if prepared as studies, as one too often sees that a good composition has been partially spoiled by weak or coarse detailing.

While architects should rightly regard drawings as only a means to an end, exhibition drawings are hardly of the same category, and a little extra attention might with advantage be given to their preparation.

"Braham," Perth.—This house was designed by Messrs. Bedford & Kitson, of Leeds, for R. D. Pullar, Esq.; an illustration of the garden front and a ground-floor plan were published in the BUILDERS' JOURNAL for January 10th, 1900. The hall is panelled in oak to about 7ft. and has an oak staircase; above the panelling is a plaster frieze of roses and honeysuckle, modelled by Mr. G. P. Bankart. The dining-room is panelled in oak to a height of 8ft., with panels inlaid with flowers; it has an oak-beamed ceiling and ingle nook, with copper *repoussé* panels by Mr. Edgar Simpson, of Nottingham. The drawing-room has a panelled dado chimney-piece, &c., of cedar, inlaid with mother-of-pearl, and a plaster ceiling modelled by Mr. G. P. Bankart.

BRICKLAYING AND TRADE-UNIONISM.

Some Facts about the New Westinghouse Works.

MR. J. C. STEWART, building manager of the British Westinghouse Electric and Manufacturing Co., Ltd., has made an interesting addition to the discussion about the effect of trade-unions on bricklaying by stating in the "Times" what has been done at the new works which his company are now erecting at Trafford Park, Manchester. In November, 1901, a regular average of 1,400 bricks per man per day had been reached, and on some days as many as 1,800 bricks per man were laid. A little later work was commenced on the pattern shop, where there are fewer openings in the walls than in any of the other buildings. In the construction of this shop the regular average was 1,800 bricks per man per day. This building is 578ft. in length by 90ft. in width. In no instance are the walls less than 19in. thick and in some instances they are 23in. thick. Mortar was used. All the walls at the works are "piers." In the centre

13ft. in diameter. It has an inside wall, or ring, separate from the outer walls, and consequently there are four faces to the stack. The first 75ft. on the inside is lined with firebrick. Work was started on January 11th. During that month, on account of the extra care required in lining the flue with firebrick, the construction of the flue openings, and the setting of the stone base and coping to the square base, our bricklaying average was only 1,533 and 1,600 per man per day of 8½ hours.

From February 1st, however, we had plain sailing, and the average number of bricks laid per man per day was as follows:—February 1st, 1,275 bricks (half day); 2nd, Sunday; 3rd, 1,393 (two hours lost, accident to brick-hoist); 4th, 1,894; 5th, 1,968; 6th to 8th, no work done on account of bad weather; 9th, Sunday; 10th, 2,022; 11th to 14th, no work, snowing and cold; 15th, 1,278 (half day); 16th, Sunday; 17th, 2,097; 18th, 1,763; 19th, 2,145; 20th, 2,086; 21st, 1,979; 22nd, no work, raining; 23rd, Sunday; 24th, 857 (half day)—20,757 brick-average per man for 10½ days. This shows an average per man per day of, say, nine hours of 1,976 bricks. The men worked 8½

"BRAHAN," PERTH: DRAWING-ROOM. BEDFORD AND KITSON, ARCHITECTS.

of each brick pier is a large "Z" bar steel column. With one exception all the buildings are faced with what is known in the trade as No. 2 stock brick. The exception is the six-storey office building, 250ft. by 50ft., which is faced with No. 1 stock brick. These facts will indicate to men who understand the business the high grade of work and the care it requires. The averages per man mentioned include face brickwork. On common work an average of 2,250 bricks per man per day was reached.

Mr. Stewart continues: "It will doubtless be regarded as a matter of public interest that our bricklaying at Manchester, which seems to us not unusual but which has attracted so much attention in this country, was attained under the direction of our bricklayer superintendents, both of them Englishmen and members of the Bricklayers' Union. The head superintendent has never been to America, but his principal assistant spent five years there, returning here some five years ago, and has remained here ever since. If further evidence be required of the number of bricks that English workmen are capable of laying in one day of 9½ hours, when assisted by up-to-date methods of handling brick and mortar, I may call attention to the brick chimney stack which we are now erecting for the Mersey Tunnel Power Station at Birkenhead. This chimney is to be 250ft. high. Its base is 24ft. square, and its flue is

hours per day up to and including February 11th, and nine hours per day since that date. This Birkenhead average has been made possible, partly, to quote the words of the bricklayers themselves, by 'facilities which are unusual in this country.'

"Some features which seem to have attracted considerable attention at Birkenhead are the methods of outside scaffolding for building the brick stack, and the double platform lift, each platform holding two barrows of bricks, one ascending while the other descends. The time occupied in raising one platform from the ground to the height of the stack, which to-day is 150ft., is only 15 seconds. Another feature which the men regard favourably as helping them to do rapid work is our method of making mortar. Our mortar is made much softer than that commonly used in England, and the bricks are laid by a light pressure of the hand and a light tap of the trowel, instead of by repeated hammering of the trowel to force the brick into place in stiff mortar. By the use of soft mortar we can lay enough with one stretch of the trowel for half a dozen to a dozen bricks. With stiff mortar, such as masons use in this country, it is possible only to spread enough at one time for a much smaller number of bricks, as the stiff mortar leaves the trowel in a mass and will not spread freely. I might add that at the height now reached by the Mersey stack

we have gone beyond the point where it is practicable to continue with outside scaffolding. From this point upwards we shall lay our bricks with greater economy by hoisting the brick on the inside of the stack, and using inside scaffolding.

"All the bricklayers, including the foreman, engaged on the construction of this stack are British workmen, and all of them are members of the Bricklayers' Union. The rate of wages paid to our bricklayers is 11½d. per hour. This is 1½d. per hour above the trade-union rate. The foreman is paid a special rate. The bricks used in the Manchester and Liverpool district are about 20 per cent. larger than those used in the London district.

"Finally, I will say that if our work has been rapidly executed it has been greatly due to the interest that has been taken by the representatives of the unions in securing for us the best men that could be obtained."

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Early Classic Architecture.

YORK.—STUDENT writes: "Kindly name some of the best authorities on early Classic architecture, especially with reference to the Greek Thomson subject for this year, the restoration of the tower of Andronicus Cyrrestes (Tower of the Winds) at Athens."

Stuart & Revett's "Antiquities of Athens," Dilettanti Society's "Antiquities of Ionia" and "Unedited Antiquities of Attica," Penrose's "Investigation of the Principles of Athenian Architecture" and Wilkins's "Antiquities of Magna Græcia."

Cost of Contractors' Railways.

C. R. D. writes: "What would be the cost per 7ft. run of a narrow gauge (1ft. 11in.) railway over fields? Plenty of slate debris is at disposal; the line is to be used for a single horse tram."

As a general rule it is more convenient and economical to adopt one of the ordinary gauges, such as 18in., 24in., 30in., &c., rather than an outside gauge necessitating specially-built rolling stock in lieu of standard patterns. No details are given as to whether the railway is required for purely temporary purposes or for permanent use. A light portable railway (2ft. gauge) suitable for horse traction, comprising steel rails weighing 12lbs. per yard run, bolted to steel sleepers spaced 3ft. apart, and ready for laying, costs from £350 to £450 per mile of single track; if provided with 14lbs. steel rails, from £400 to £500 per mile, and £450 to £550 per mile with 18lbs. rails. This kind of railway can be readily taken up and refixed in other positions, and is eminently suitable for temporary engineering works, quarries, &c. A 2ft. gauge light railway formed with 12lbs. steel rails, 5in. by 3in. creosoted fir sleepers 3ft. 6in. long, including fishplates, bolts, spikes, &c., complete and ready for fixing, costs about £300 per mile, if with 14lbs. rails, £330 per mile, and £400 per mile for 20lbs. rails. The cost of laying rails, sleepers, &c., varies considerably according to the locality, nature and surface of the ground, but for portable railways it may be taken at £120 to £200 per mile of single track, and £150 to £350 per mile for laying light railways with wood sleepers, including ballasting with the materials available on the site. From the data here given it will be seen that the cost of a light tram or railway may vary from 5s. 6d. to 8s. 6d. per yd. run.

T. E. C.

Bonding Brick Piers.

BLUE BRICKS writes: "I wish to carry a floor over a large area on blue brick piers in cement, 13ft. high, each pier to carry a distributed dead load of 25 tons. Would 14in. piers

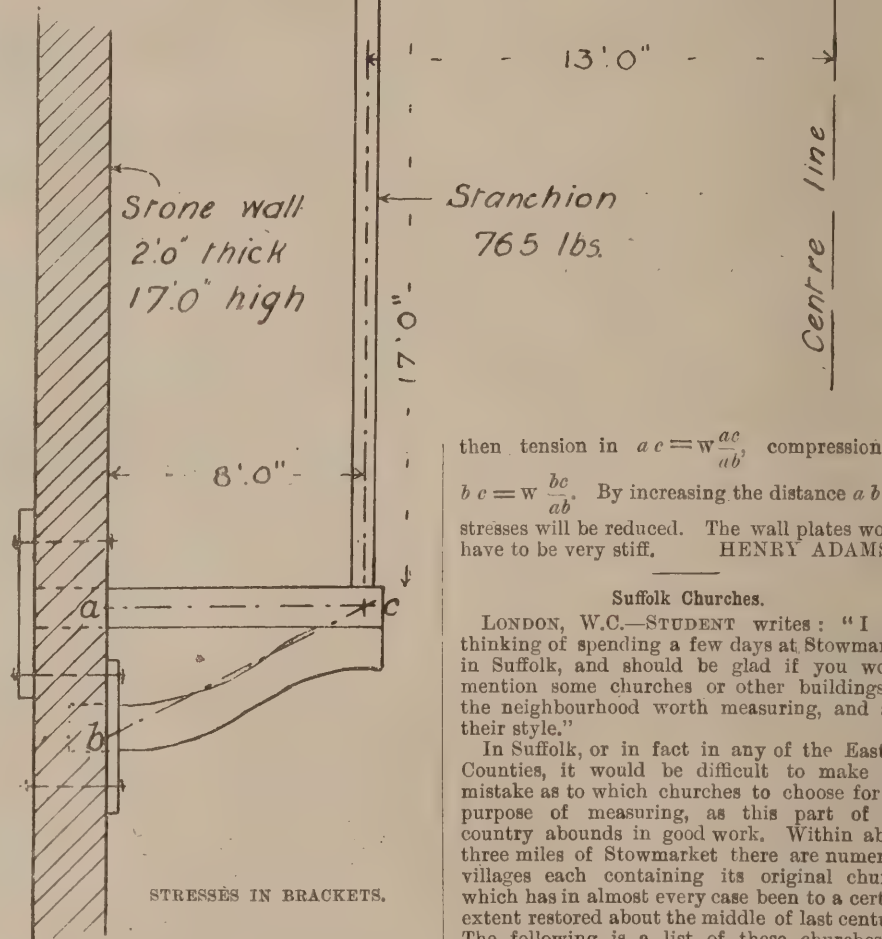

bonded as per sketch No. 1 be sufficient, or should they be bonded as No. 2? Owing to the number of 'closures' required in an 18in. pier as per sketch No. 3, is there much advantage in this over No. 2?" (Sketches not reproduced.)

Neither a 13in. nor an 18in. pier would be safe, though an 18in. by 27in. would. We advise you to use steel stanchions.

Size of Flue for Boiler.

NORTHAMPTON.—BENIX writes "What size flue will be required for an 8-h.p. Cornish boiler? The flue is to be square inside and to go up the side of a building 62ft. high to ridge. How thick should the walls be, and is there any rule for determining the size of flues?"

It would have been more satisfactory if the size of the boiler had been given, or the coal consumption, or the water evaporated per hour, as nominal horse-power is an indefinite commercial term which carries no precise meaning. An 8-h.p. Cornish boiler would probably be about 9ft. long and of 4ft. 6in. diameter, with a furnace 2ft. 7½in. diameter and 4ft. long. The firegrate area would then be 10½ sq. ft., and allowing the chimney flue to be not less than ⅙ of the firegrate area it would be, say, 18in. by 14in.—The inside of flue should be lined with 4½in. firebrick for 20ft. up, not

bonded to the external wall, and with an airspace all round. Above the firebrick lining the flue may gather in, so as to keep the area for gases as uniform as possible. The walls of the flue may be 14in. thick at the bottom in addition to the firebrick lining, reduced to 9in. above the lining, with two courses of Staffordshire blue plinth bricks on the outside, reduced again to 4½in. thick at about 45ft. from the ground, with similar plinth bricks on the outside. This is the minimum that can be adopted; it would be better to increase the thicknesses by 4½in. all the way down.

HENRY ADAMS.

Stresses in Brackets.

ABERDEEN.—D. writes: "Kindly explain how to determine the strains upon the steel bracket shown on the accompanying sketch. It is proposed to carry the upper beam A (which supports a gallery subject to a live load) right through the wall and attach it to a plate on the other side. The lower curved beam B will be similarly attached to a plate abutting against the wall as shown. Both plates will be bolted to wall and to each other. A steel stanchion supporting a steel roof-truss rests on the end of the bracket. Brackets and trusses, &c., occur at 10ft. centres."

Draw direct lines *abc* as shown by stroke-and-dot, let *w* = whole load on stanchion at *c*,

then tension in $ac = w \frac{ac}{ab}$, compression in $bc = w \frac{bc}{ab}$. By increasing the distance *ab* the stresses will be reduced. The wall plates would have to be very stiff. HENRY ADAMS.

Suffolk Churches.

LONDON, W.C.—STUDENT writes: "I am thinking of spending a few days at Stowmarket in Suffolk, and should be glad if you would mention some churches or other buildings in the neighbourhood worth measuring, and also their style."

In Suffolk, or in fact in any of the Eastern Counties, it would be difficult to make any mistake as to which churches to choose for the purpose of measuring, as this part of the country abounds in good work. Within about three miles of Stowmarket there are numerous villages each containing its original church, which has in almost every case been to a certain extent restored about the middle of last century. The following is a list of these churches:—Creeping St. Mary, two miles south-east of Stowmarket, having a Gothic church of the same name; Creeping St. Peter, with the church of St. Peter, containing an old font which had some of its carving broken by Cromwell's soldiers; Harleston, two miles and a half to the north-west, with St. Augustine's Church, an ancient thatched building having Early English and Decorated tracery and consisting of a nave, part of which is separated off by a rood-screen to serve as a chancel; Little Tinborough, three miles to the south-west, with the Early English church of St. Mary; Onehouse, two miles to the west, with the church of St. John Baptist, which belongs to the Decorated period and

contains an ancient font; Haughley, three miles to the north-west, with the church of St. Mary, containing Decorated and Perpendicular tracery, also portions of an ancient castle of the same name destroyed in 1173; Needham Market, three miles and a half to the south-east, with the church of St. John Baptist, built in 1460, a very good Perpendicular work having a carved open wood roof—also Theobald's Grammar School, founded 1632. In Stowmarket itself is the church of St. Peter and Mary, a large cathedral-like building of the Decorated and Early English periods. The old vicarage dates back to Tudor times, and Thorney Hall (near the station) to a more distant date still, being the seat of the King's Bailiff from the commencement of the Norman Period to Henry I.'s reign. A portion of the Hall still stands, although now converted into maltings. Somewhat farther away, but within the area of a bicycle ride, lie Ufford (near Woodbridge) in the one direction, and Long Melford in the other, the church in the former village being famous for containing the finest font-cover in England, while the church at Long Melford is one of the best examples of flint rubble-work within traceried panels of freestone. Both are of the Perpendicular period.

G. A. T. M.

Strength of Floor.

LONDON, W.C.—B. P. writes: "(1) Can a floor composed of 1½ in. boarding be safely supported by being housed in. into a 9 by 6 beam at a distance of 2 in. from the underside? As little as possible of the beam must show beneath the floor, and the construction must not be costly. Would a 2 by 2 by ½ angle-iron be better screwed to the side of the beam? (2) Would two thicknesses of 1 in. boarding be sufficient for the outside wall of a bay window with an air-space of 2 in., or could you recommend some sort of filling?"

(1) A 1½ in. floor might be housed into a beam as shown on querist's sketch (not reproduced) if the span of the floor boards did not exceed 5 ft., but it is difficult to see what useful purpose this would serve. The lower the housing groove is made in the beam the more the beam is weakened. A 2 by 2 by ½ angle-iron is a section that is not made and would be no better than an arris fillet or rectangular fillet of wood, as the strength would depend upon the fixing. (2) If the building is of a very cheap character and not subject to any by-laws or regulations, two thicknesses of 1 in. tongued boarding with 2 in. of sawdust between might be used for the walls of a bay window. HENRY ADAMS.

Constructing Vaults under Public Roads.

CROYDON.—J. D. writes: "What is the law, if any, which gives the right of freeholders to construct vaults under the highway and to have openings giving access to them?"

The right to construct vaults under public roads and to make openings from them into the public thoroughfare depends primarily on the question of the ownership of the land in which the vault is excavated. If querist looks at his lease he will see the boundaries of his property. Very frequently the plot leased extends to the middle of the public thoroughfare, in which case, excepting the rights of the corporate bodies in whom they may happen to be vested, and subject also to any by-laws which may have legally been made concerning the building of such structures, and to the various powers conferred on urban authorities as below set out, querist has a perfect right to make the vault. If, however, his boundary is the front wall of his house, and if in order to make the vault he would have to excavate under the public thoroughfare, by doing so he would commit a trespass. I would advise him under these circumstances to negotiate with the bodies in whom the road is vested for powers to carry out the works he desires. He will in any case have to conform to their by-laws and build subject to any existing mains for water, &c., which they may have laid. Under the 26th section of the Public Health Act of 1875 an urban authority may prevent the construction of any vault under the carriageway of any street without their written consent. They may, moreover, pull down any building which has been erected in contravention of this section.

W. JOHNSON-ROBERTS.

TIMBER ROOF-TRUSS FOR PUBLIC HALL.

Timber Roof-Truss for Public Hall.

ILKLEY.—R. F. writes: "Kindly answer the following question set at the R.I.B.A. final examination:—A timber roof-truss to span a public hall 50 ft. wide, no tie-beam allowed. (I only want a rough sketch just to indicate the form of truss, with a few of the scantlings.)"

The accompanying sketch shows the outline suggested for the roof-truss in a form that will admit of some ornamentation. Where cut away for halving, the joints should be strengthened by iron straps. The scantlings are approximate only.

HENRY ADAMS.

Right of Authorities to Reject Plans and Compel Sale of Land.

PONTEFRAC.—DOUBTFUL ONE writes: "My client wants to pull down his present ancient shop and rebuild at the corner of a narrow street in the busy part of a town, which street the authorities desire to widen if he does pull down the shop. Can the authorities refuse to pass my plans if my client does not consent to set back? If not, can they compel him to set back and sell to them what land they want?"

Yes; if he pulls down and desires to rebuild he must, if the urban authority so desire, set back his new building; but he is entitled to compensation. (See Public Health Act 1875, section 155.) Some Acts affecting corporate public bodies, e.g., the Improvement Acts, give power in certain cases to rural and urban councils to make legal by-laws compelling a person rebuilding a house to set it back. The authorities have no power at common law under the circumstances mentioned to compel your client to set back his house on rebuilding, but they may do so under the Acts above mentioned. You should obtain a copy of the by-laws applicable to the town in which the building is proposed to be erected, and see if any rule or regulation has been made to enable the authorities to do as you think they may; and also ascertain from them under what Act of Parliament they are proceeding.

W. JOHNSON-ROBERTS.

Descriptions of Plots of Ground Surveyed.

J. B. writes: "Kindly name a book giving the principles on which surveyors proceed in framing verbal descriptions of plots of ground surveyed, or state the rules which should govern such descriptions. I have not been able to find any book which deals with this question. In the division of, say, the area of a county council into wards for election purposes I believe it is the practice to commence at a well-defined point and thence to perambulate the whole area, following the directions of the boundaries by the changes in the points of the compass until the point first described is again reached. But in the descriptions of plots of ground for building purposes for insertion in conveyances I believe a different principle is followed."

The only principle worth following is that of common-sense. There seems to be no rule upon the subject nor any universally-adopted practice. The great thing to do is to make the verbal description as clear as possible, or not to take

the place of the plan but to be read together with it, neither plan nor description being complete by itself. Legal phraseology should be avoided as far as possible and the description be made terse and unmistakable. Such verbose descriptions as the two examples cited (but not now given) are to be avoided as serving to confuse rather than to expound.

G. A. T. M.

Brick Chimney Shaft.

EDINBURGH.—CHIMNEY SHAFT writes: "The nearest high building to the boiler chimney shaft shown on the accompanying drawing (not reproduced) is one 40 ft. to the roof and 200 ft. distant from the shaft. Is the internal diameter of the flue sufficient? It is not at all likely that another boiler will ever be installed. Is it desirable that the foundations of the shaft should be kept clear of the foundations of the adjoining walls of the building, the subsoil being stiff clay?"

It is not usual to bond in the firebrick lining with the shaft itself. There is generally a space of 1½ in. left between the two to allow for expansion and contraction, this space being protected from falling dirt and soot by an oversailing course just above the lining. It depends upon the nature of the subsoil whether the foundations of the shaft should be kept clear of the adjoining building; the important point is not to overload on that side so as to cause tilting. The size of flue may be determined from the size of the firegrates. In this case 2 × 2 ft. 4 in. × 6 ft. = 28½ sq. ft., and allowing ⅓ of firegrate area the flue would require 3.56 sq. ft., which would be given by a diameter of 2 ft. 1½ in. By another rule:—Area chimney sq. in. =

$$\frac{120 \times \text{grate surface sq. ft.}}{\sqrt{\text{height feet}}} = \frac{120 \times 28.5}{\sqrt{50}} = 484,$$

which is given by a diameter of 22 in.; so that 2 ft. internal diameter would probably be sufficient for one boiler of the size given when burning ordinary steam coal.

HENRY ADAMS.

Uralite.

ONE ANXIOUS TO KNOW writes: "A contemporary journal says: 'Uralite, a substance made of asbestos fibre, will be used in the construction of the building for the sake of coolness. The 'Century Dictionary' says: 'Uralite is a mineral which has the crystalline form of augite, but the physical properties and especially the cleavage and specific gravity of hornblende.' Evidently this latter uralite is not that first referred to. Can you enlighten me?"

This material is made by the British Uralite Co., Ltd., of 37, Lombard Street, E.C., from whom all particulars can be obtained.

Drainage of Burial Ground.

SOUTHAMPTON.—STUDENT writes: "I wish to thoroughly study the drainage and laying-out of burial grounds. I know that the Local Government Board require the ground to be drained to a depth of 8 ft., but does this apply to the whole area? In that case how is the drainage system to be laid, what pipes (and sizes)

are required, and how is the ground water disposed of after running through the pipes? How long after laying and covering up the drains should the ground be left before it is in a state to be used? Should the paths, &c., have a separate system of drains to carry off the storm-water? Please mention any books dealing with the subject."

Speaking generally, the control of burial grounds is vested in the Home Office, though under the Public Health (Interment) Act, 1879, the Local Government Board have to be consulted when cemeteries are established by a sanitary authority. No new burial ground may be opened without the licence of the Secretary of State, and this will only be given after full enquiry and inspection of the proposed site. The Home Office has therefore issued regulations under the Burial Acts of 1852-3-4-5-7 and 9, 1860 and 1871, together with a list of "Suggestions" as to situation, soil and drainage, paths and roadways, fencing and planting, size and depths of graves, reopening of graves, burial in vaults, size of burial grounds and other matters germane to the question. These regulations and suggestions are generally in line with the memorandum issued by the Local Government Board (December 13th, 1880) on the same subject, the following extracts from which may be of value: "The sanitary requirements for a cemetery . . . may be summed up under four headings—(1) suitable soil and proper elevation of site; (2) suitable position, especially with regard to houses and sources of water-supply; (3) sufficient space; (4) proper regulation and management." In answer to your enquiry, the soil should be "of an open porous nature, with numerous close interstices through which air and moisture may pass in a finely-divided state freely in every direction. The soil should be easily worked, yet not so loose as to render the work of excavation dangerous through the liability to falls of earth. It should be free from water or hard rock to a depth of at least 8ft. If not naturally free from water, it should be drained, if practicable, to that depth: to this end it is necessary that the site should be sufficiently elevated above the drainage level of the locality, either naturally or where necessary by filling it up to the required level with suitable earth." The "Burial Act" of 1855 requires that no new burial ground shall be opened within 100yds. of a dwelling-house, unless with the written consent of both owner and occupier. But for cemeteries under the Public Health (Interment) Act, 1879, with which the Cemeteries Clauses Act of 1847 is incorporated, this distance must not be less than 200yds. Coming now to your questions in detail, you will gather that the rules as to drainage soil, &c., are only intended as a guide and are subject to the discretion of the inspector who will be sent to view the site and the trial holes which must be dug for him to a depth of 8ft. The drainage applies to the whole area (unless there exists a lower part which is capable of being filled up), and of course this means that land incapable of drainage to that depth will not be sanctioned for use as a burial ground. You will find several methods of deep drainage mentioned in the Appendix A, No. 2, to the Home Office Rules issued May, 1887. The drainage of surface-water is also dealt with in the same document, and this must of course be provided for in all soils incapable of taking it by percolation. It is not essential, though perhaps desirable, that the footpaths should have an entirely separate system of drainage, but this could probably be managed by conducting the water from the paths to various selected points, where it could be discharged by shafts into the deep drains. Grates with dirt boxes or catchpits should be provided to avoid the possible stoppage of the deep drains by detritus. The paths are best formed of asphalt or some other material which will be dry and fit for service in all weathers. You will find the various "Burial Acts" dealt with very fully in "The Law of Burials" by J. B. Little, a book published by Shaw & Sons, price 17s. 6d., and the regulations to which I have referred are also set out in that work. The actual details of the "drainage" operations are to be found in any book on land drainage or in "Specification" No. 5, under that heading.

G. S. M.

Patents.

SUSSEX.—G. A. W. C. writes: "Referring to your leader on the new Patents Bill, would it be best to wait until this is made law or proceed at once? Will the expenses be any greater than they are now?"

The new Bill, if passed, would not come into operation till next January and would increase the fees by £1. The grant of a patent under the Act would be no more valuable than under the existing law, though by the preliminary examination you might be saved the expense of spending money on an anticipated invention. If you are in a hurry, it would be as well to take out your patent now.

Nicholson's "Principles of Architecture."

EAST HAM.—F. F. writes: "What is the value of Nicholson's 'Architecture'? I have the three volumes—vol. 1, on Mathematics, &c.; vol. 2, on Roman and Grecian Mouldings and the Projection of Shadows; and vol. 3, on Ornaments and the Orders of Architecture. They are dated 1795-1796. Are they standard works?"

The book you refer to is Nicholson's "Principles of Architecture." It is a very early edition, and later editions have been published so late as 1848. The actual selling value would be about 7s. 6d. A good deal of the matter in it would be more or less obsolete, and is replaced by such books as Gwilt's Encyclopædia.

Railing around Hatch.

FRASERBURGH.—BROCH writes: "Do you know of any means by which a railing to pull up and down could be placed around a hatch at the foot of some stairs in a shop, so that people might be prevented from falling down when the hatch was lifted?"

If you apply to the Bostwick Gate and Shutter Co., Ltd., Baldwin's Gardens, Gray's Inn Road, W.C., we think they will be able to supply you with what you want.

Quantities included in Contract.

KIRKLEY.—G. L. writes: "The following notification appears in quantities: 'These quantities will, with the drawings and general conditions, form the basis of contract. Should there be more or less measure than is here given there will respectively be an addition to or a deduction from the contract.' Is the quantity surveyor or building owner liable? To whom should I send in an account, if necessary?"

The building owner is liable, the quantity surveyor being the employee of his agent, the architect. Send in the account to the architect.

Responsibility for Omissions in Quantities.

TEDDINGTON.—T. W. L. writes: "Is a quantity surveyor, employed independently by the architect, responsible for an error of omission in quantities, or can he claim the extra value of work done from the building owner?"

If the quantities do not form the basis of a contract, and they generally do not, you cannot recover for omissions, as you were supposed to assure yourself of their accuracy before tendering.

Preventing Varnish "Cissing."

KINGSTON-ON-THAMES.—KINGSTON writes: "What is the cause of varnish cissing on grained work? It has occurred on imitation oak and mahogany, and also on a plain colour largely composed of stainings with hardly any lead. Harland's copal varnish is used, the surface being first rubbed over with whiting. By 'cissing' is meant that the varnish, instead of flowing together in a body, separates into what may be called lines of bubbles, leaving part (perhaps half the work) in streaks without the varnish."

The cissing is in our opinion due to a greasy or fatty substance in either the stainings or the driers, probably the latter, but as we are ignorant of the ingredients we must leave you to judge. Turpentine and oil are often greasy, and turpentine should never be used in driers where varnish is intended. Litharge and sugar-of-lead ground in oil (linseed oil) are the best driers. The cissing can be prevented by covering the surface firstly with a thin paste of whiting.

Determining Specific Gravity of Cement.

LEICESTER.—PUZZLED writes: "Please explain in a simple way how to obtain the specific gravity of cement; also, of what use is the knowledge?"

The specific gravity must not be confounded with the weight of powdered cement in air. The specific gravity of cement, of course, cannot be found by putting it in water, as it would slake. The usual method, therefore, is to use benzine, petroleum spirit or turpentine. The last is the best. A bottle with a graduated neck is filled to a certain mark with turpentine and weighed, and a certain weight of dry cement is then added gradually so as to let the air bubbles escape. The increase of volume is noted, and from these data the specific gravity is found. The specific gravity of a fresh cement averages about 3.15, and after exposure to air for some time is about 3.10. The specific gravity is an accurate measure of the weight of a given volume of cement. It is one of the several necessary tests to judge of the quality of a cement and should not be omitted.

Books on Building Construction.

W. M. writes: "Kindly recommend books for the examination in Building Construction, Advanced Stage, held by the Department of Agriculture and Technical Instruction, Ireland. I want a book on quantities just sufficient for the examination."

Rivington's "Notes on Building Construction, Vols. I. and II." and J. P. Allen's "Building Construction," also our articles on Building Construction; and if you have access to a library consult the works on the branches of building construction which are given in Mr. B. T. Batsford's "List of Standard Books," to be obtained from him at 94, High Holborn, W.C.

Ventilation of Small Schoolroom.

LONDON, N.W.—FENLAND writes: "Would several Tobin air-inlets with air flues in the chimney stacks be sufficient for the ventilation of a small school? The room is about 31ft. by 25ft. by 14ft."

The method proposed would be very efficient.

Approximate Cost of Town Hall.

SOUTHPORT.—H. T. C. writes: "What would be the approximate price per cub. ft. of a town hall with, say, three elevations to streets, in Yorkshire stone, fittings to be good but not extravagant?"

An approximate price would be 1s. 3d. per ft. cube.

Removing Efflorescence on Brickwork.

LONDON, S.W.—INSURED writes: "Referring to the removal of white efflorescence on brickwork (see p. 451 of the issue for February 12th), what acid should be used for red bricks and for stocks, and how should it be applied?"

Commercial sulphuric or muriatic acids are best. Mix about 1 volume of acid with 10 of water and apply with a stiff brush; afterwards clean down with water. The acids rot the brushes; therefore, use common ones and those bound with cord in preference to wire.

Party Walls.

LONDON, S.W.—OCCASIONAL CONTRIBUTOR writes: "My client is desirous of erecting a billiard-room over his kitchen. This latter is a top-lighted building in the rear of his house, and is separated from his neighbours' kitchen by an 18in. wall on either side. Supposing I am fortunate enough to obtain the consent of the adjoining owners to raise the party walls, am I under an obligation to build the new walls of the same thickness? For my purposes a 13in. wall is sufficient, and I would like if possible to make its external face in the same plane as the internal face of the neighbouring kitchen wall. This would result in a gain of 9in. in the width of the billiard-room."

We are of opinion that a 9in. wall would be sufficient, but you must not build on your neighbour's half of the party wall without obtaining his permission, which could probably be done for a small consideration.

Views & Reviews.

Building Trades Accountancy.

Whilst builders' book-keeping, if thoroughly done, is always a complex matter, literature of the subject is scanty and its utility questionable; and we are sorry to have to apply the same description to the latest effort in this direction, issued as the third volume of "The Accountant's Library." This book is intended, according to the preface, to supply the student with specialised information, "while each volume will be the work of one who has made that particular class of accounts more or less a speciality."

Accountants, *quâ accountants*, love to revel in a maze of bewildering detail; and whilst this may be forgiven when some really useful purpose is served, it cannot be when the ultimate result is little more than a sinful waste of expensive stationery and clerical labour. Passing from the general to the particular, we will now proceed to analyse the fifty-four pages of "model" accounts, following which are seventeen pages of "modifications," adapting the former to the needs of a small builder.

Priority of place is given to The Register of Tenders, p. 3, and our author proceeds to show how prices should be arranged. "Suppose that the specification requires 900 sq. yds. of brick-work, and that the builder is willing to do this at 6s. per sq. yd. He will instruct the clerk in charge of the Register to divide the 6s. (say) thus:—

Wages - - -	at 2s. 6d. per square yard.
Material - - -	" 3s. 2d. "
Establishment charges - - -	" 3d. "
Profit of - - -	" 1d. "

6s. 0d."

Further: "Some builders prefer to base this calculation" (establishment charges) "on the total estimated cost, while others arrive at the amount from the number of hours the workmen are expected to spend on the work" (italics ours). And as an example of hair-splitting accountancy the following, read in conjunction with the foregoing, is worth recording: "for the time occupied, and not the amount paid, is the true principle to work on" (italics author's). As regards the example given of the Register, we need only remark that we have never seen one arranged or kept thus, and never expect to. Passing to the Purchase Journal, p. 6, we find the bulk of the space occupied by columns for analysis. The Accounts Rendered Book, p. 8, is next dealt with, which, says the author, "corresponds with the Sales Journal of a trading concern. It is written up from the invoices before they are sent out, &c." We were unaware that a building business was other than a "trading concern," and we strongly object to the cart-before-the-horse style recommended. Passing to the Wages Book, we find that daily returns and daily entries are called for, and provision is made for a Sub-Wages Cash Book to record "the advancing of money to workmen on account of their wages." The example of the Wages Book, p. 14, is an elaborate affair, with special columns for recording "subs," and the apportionment of establishment charges. The Contract Journal provides *inter alia* for the workmen's names, and daily hour totals are duly recorded—a totally unnecessary refinement; and as the example given, p. 16, contains only entries relating to jobbing work, we must confess we are somewhat at a loss to reconcile matters. We must object to the author's method of referring to each job, contract or jobbing, by number only. Those who have had experience of the building-trades operative's special faculty for muddling things up generally, even when name and number are both given, will appreciate this point.

The Petty Cash Book exemplified, p. 21, is "kept on the imprest system" (tabular); and where the entries in this book are analysed and copied into the "main" Cash Book, this system can be recommended. The Stores Issued Analysis Book, p. 27, we regard as quite outside the range of practical bookkeeping. The following is an extract from the instructions accompanying it: "When stores [materials] are required for any particular work, application is made at the office and an order is made out and signed by a responsible person . . . differently coloured paper for contracts, jobbing,

and cash sales . . . and handed to the storekeeper as his authority to deliver the goods. . . . In the case of contract or jobbing orders, the cost price will be shown . . ."

The Stores Returned Analysis Book, p. 28, is as unpractical as the foregoing, and the use of this book for materials transferred from one job to another is scarcely to be recommended. The mention of Plant, p. 30, betrays that our author is on shaky ground, the subject being dismissed in twenty-one lines. To the statement that "an ordinary Transfer Journal and Ledger are sufficient to meet the case" exception will be taken by everyone who has had to do with this worse-than-troublesome phase of builders' book-keeping. The arrangement of the Contract Ledger, p. 35, though on ideal lines, is incomplete, but is one that finds scant favour among builders, and it must be confessed that should the cost of any job require analysing it will be

produce its due ratio of profit. And coming again to the establishment charges question—one that the author seems to unnecessarily labour—we find on p. 69 some examples of their apportionment—£24,300 bearing an addition under this head of £800, an amount of £29,830 being debited with £250, whilst £34,594 has to bear a load of £1,030. It is not intimated if these amounts are or are not arrived at under the "fairest" total - of - hours system; but the number of builders, if indeed any, making it a practice to appropriate these charges to the costs of contracts is small; and where such appropriation is made, our opinion is that the total cost would be a pretty sure and fair basis upon which to make the calculation. Moreover, as it is quite possible through office extravagance to convert a gross profit into a nett loss, we should prefer a Trading Account showing the *gross* profit earned on the year's operations, leaving all

PALAIS DE JUSTICE, BRUGES. DRAWN BY E. STANLEY MITTON.

less ultimate trouble to dissect the concrete mass of detail than to tabulate the entries as made. The arrangement of the Jobbing Ledger, p. 37, is not practical from a builder's point of view; and the following "dark saying" occurs in the accompanying description: "The main object in view in keeping the Jobbing Ledger is to have the details of the cost in a convenient form to assist in making out the invoice and the price charged therein, and not for guidance in future tenders." Passing to the specimen Journal Entries on p. 44, we protest against detail figures being extended into the posting columns, fail to appreciate the ruling-off lines in the body of the said columns, and question the wisdom of showing inaccurate totals. We fail to see the utility of the "Jobbing" Profit and Loss Account, p. 52, wherein every item of jobbing is enumerated. At best it is but a useless piece of nicety, as every jobbing work should

deductions by way of "losses" to the Profit and Loss Account.

The book is well got up and printed on good paper, but we are afraid that it will be of slight use to accountants so far as giving them an insight into builders' book-keeping is concerned, and of little use to builders except to give them an insight into the methods of pure accountancy. Twelve months' experience in a respectable builder's office would have enabled the author to have shorn his work of much of its superfluous detail; and it is to be regretted that this and similar ventures are not either compiled in conjunction with or submitted before publication to someone who is, before everything, thoroughly conversant with the requirements of his trade or profession, and with the methods of accountancy second.

H. E.

"Builders' Accounts," by J. A. Wallbank, A.C.A. London: Gee & Co., Moorgate Street, E.C. Price 3s. 6d. nett.

The Greatest Italian Sculpture.

The three great ages of sculpture have satisfied aesthetic demands in three different ways—the Greek of the fifth century B.C. by dominating the material and the technique by the form; the mediæval of the thirteenth century by guiding men to greatness through Nature; and the Renaissance of the fifteenth century by devoting the greatest attention to the colour and surface treatment of the material. It is with this last period that we are now concerned.

The Early Renaissance embodied the inspiration communicated through the Latin classics, and to it belong the portrait, the relief and the tomb. We have the origins in Nicola Pisano, whose pulpit in the Baptistery at Pisa (of which building he was the architect) shows a release from the older standards; it is a six-sided box supported on six pillars of different-coloured marble, connected by Romanesque arches having Gothic cusps. Niccola trained his son and other workmen and thus was formed the "Pisan School," made famous by its three master-sculptors Giovanni Pisano, Andrea da Pontedera and Orcagna the Florentine. In following the development it is interesting to note the difference between Niccola's pulpit and Giovanni's, the latter being thoroughly unarchitectural and overloaded with detail, a distinction which shows how much the father was ahead of his age, whose true affinity was with Gothic. The next name that attracts our attention is that of Jacopo Della Quercia, who marks the transition between the Pisan and Florentine manner: "so striking was the effect of his style in his first masterpiece, the Fontegaja of Siena, that he was straightway called Jacopo of the Fountain"; his tomb of Ilaria del Carretto in the cathedral at Lucca is a beautiful work, its frieze of garland-bearing cupids being a vanguard of the cherub host of Renaissance art. Then we come to Ghiberti, who outclassed both Della Quercia and Brunelleschi in the competition for the bronze doors of the Baptistery at Florence—those "Gates of Paradise" (as Michelangelo called them) on which he spent fifty years—his marvellous life-work. Following him, Donatello, with a great range of technique, produces his St. George of Orsanmichele, his shrine of the Annunciation in Santa Croce at Florence, his bronze David, the Gattamelata equestrian statue at Padua (culminating product of his third period); and the two bronze pulpits for San Lorenzo, Florence, in the designing and beginning of which he spent his last years. Next we reach Luca Della Robbia, the most really Greek of them all, with his "blue and white divinations of the Hellenic," his knowledge of the limitations of the material, and his devoted attention to form.

The influence of these great men on the minor sculptors of the Early Renaissance is very marked, and many fine works are produced through its inspiration. We however pass by the marble workers and the bronze workers to the men of the Late Renaissance. Taking Andrea Sansovino and his pupil Jacopo Tatti as the sculptors who marked the transition between the two periods, we come to Giovanni da Bologna. We see copies of his bronze Mercury on every hand—that "child of Heaven with winged feet"—and it is doubtless his best-known work; but the marble group at Florence representing the rape of the Sabinas is even more alive with motion, though perhaps it transgresses the laws of glyptic art. Benvenuto Cellini follows—"type of the Renaissance braggadocio, man of lusts and lies and poetic fancies, true artist always, and the best goldsmith of his times"; the last fact accounting for the effect of his Perseus, a work marred by its detail, which is more appropriate to a salt-cellar than the pedestal of a large statue. Finally, we arrive at Michelangelo, that wonderful genius who created the Pietà at St. Peter's, Rome; the David familiar to all art students; and those great tombs in San Lorenzo at Florence. "His genius leaps to that culminating point in the representation of form where it is possible to create figures of the highest expressive value, which are ideal in proportion and even in structure, and which, without breaking Nature's laws, extend them to combinations which are not Nature's, but are the creations of the sculptor."

This book illustrates all the chief works men-

tioned and the illustrations are so placed that they occur opposite the matter relating to them, a most desirable requirement, but one often neglected. The author has written an introduction "On the Enjoyment of Sculpture." While it is true that the historian often fails to appreciate art because he is not in sympathy with it, and some men value an orchid more for its rarity than for its intrinsic beauty, we consider that our author is wrong in allowing his feelings alone to dominate his judgment. This is illustrated by his statement that "unless the architect who studies Brunelleschi's dome feels the unique beauty of its wonderful curve, unless the archaeologist who dates a Greek vase is in some degree teased out of thought by its loveliness of form, he is as blind to primary values as were the Roman peasants who made a quarry of the Forum and burned antique marbles to procure the lime for their wretched huts."

We are becoming emancipated from the belief that architecture is governed by no laws and from the misdirected enthusiasm which asserts that architecture is detail and not construction; and in the other arts the same considerations apply, however much some artists may think that they work in a region where there are no laws but those of sight.

"Italian Sculpture of the Renaissance," by L. J. Freeman, M.A. London: Macmillan & Co., Ltd., price 12s. 6d.

The Art of Building.

Mr. Dobson's admirable little book has now gone into fifteen large editions; the last has been revised to date by Mr. John Parnell Allen, as the author resides in New Zealand. Mr. Allen's qualifications for the work are considerable, he having written a very able and clear elementary work on building construction. To the book under review he has contributed a useful chapter on "An Ideal Dwelling." Mr. Dobson's style adds interest to the driest facts, and his work is a very useful and necessary one for a beginner to read. The book makes no claim to comprehensiveness or to be a textbook, but by being short it gives the student a fairly wide grasp of some of the chief considerations in good building and their interrelation. We could wish that Mr. Allen had as clear and pleasant a style.

"Rudiments of the Art of Building," by Edward Dobson, M.I.O.E. Revised by John Parnell Allen. London: Crosby Lockwood & Son, 7, Stationers' Hall Court, Ludgate Hill. Price 2s.

A New Rome.

What changes have been made since Shelley wrote from Rome in 1819: "The ruins of the ancient Forum are so far fortunate that they have not been walled up in the modern city. They stand in an open, lonesome place, bounded on one side by the modern city, and the other by the Palatine Mount, covered with shapeless masses of ruin. The tourists tell you all about these things and I am afraid of stumbling in their language when I enumerate what is so well known." The excavations have altered what was "so well known," and tourists need to revise their history by such a book as this one by Professor Lanciani, who, with Commendatore Boni (now directing the excavations), has done more than anyone to confirm theories and traditions by actual discoveries and also to prove the fallacy of some contentions by historians and archaeologists. The earlier excavations stopped as soon as a paving-stone or a brick or marble floor was found; but since then deeper levels have been reached, with most surprising results. In 1882 when the temples of Julius Cæsar and Castor and Pollux were cleared away no search was made below the level of the street pavements, yet six years afterwards Professor Richter went 9in. lower and discovered the remains of the Arch of Augustus. The Heroon of Romulus in the Comitium was another discovery due to perseverance, a monument about which so much discussion centred. The object of the present excavations is to reach the early imperial, the kingly, or even the prehistoric strata and in considering these it is well to remember the extensive rebuilding by the various emperors after the fire of 283 A.D. which seriously injured or completely destroyed the buildings in and around the Forum, the Comitium and the Sacra Via; the last was afterwards transformed by Maxentius from a narrow lane to a great avenue 67ft. wide. Many particulars about these dis-

coveries have been published in our columns from time to time, so that there is no need now to repeat them: suffice it to say that they are all dealt with by Professor Lanciani, more fully, of course, than has been done elsewhere. Other chapters deal with "The Truth about the Grave of St. Paul," "Jewish Memorials in Rome" (the Jewish colony, however, is now dispersed), "English Memorials in Rome" (which, so far as existing monuments are concerned, date back to the first century of the Empire) and "Scottish Memorials in Rome." The book, which is illustrated by numerous illustrations, is written in a most interesting manner and is a fitting addition to the author's other works.

"New Tales of Old Rome," by Rodolfo Lanciani. London: Macmillan & Co.

Correspondence.

Eastbourne Technical Institute Competition.

To the Editor of THE BUILDERS' JOURNAL.
LONDON, S.W.

SIR,—Referring to the letter on p. 52 of your last issue, the tenders given were not for "the first premiated design," but for an entirely new design necessitated by further instructions from the Council.—Yours truly,

PHILIP A. ROBSON, A.R.I.B.A.

Builders' Notes.

The Plumbers' Registration Bill was read a third time and passed in the House of Lords last week.—Thirty master and operative plumbers were recently examined at King's College for registration under the National Registration of Plumbers by the Worshipful Company of Plumbers. The practical test included lead bossing and the making of plumbers' joints, &c. The examination questions included the subjects of contamination of drinking water from faulty connections, roof covering, arrangement of bath, sink and closet wastes, drainage of town houses, and disconnection with sewers. Sixty per cent. of the masters and 40 per cent. of the operatives succeeded in passing the examination.

Storage of Timber.—A meeting of the London Section of the Timber Trade Federation was held at the London Chamber of Commerce on March 4th to decide what action should be taken in the interests of the London timber trade in view of the London County Council having asked the Metropolitan Borough Councils for an expression of their views on the necessity for further legislation with reference to the alleged danger to which dwelling-houses are exposed by reason of the storage of timber on the roofs of buildings and against the boundaries of yards where such boundaries are adjacent to dwelling-houses. Mr. C. J. Morgan, vice-president, occupied the chair. Mr. G. T. B. Cobbett contended that the existing law sufficiently met the requirements of the case. After discussion it was moved by Mr. Cobbett, seconded by Mr. John Grover (builder), and unanimously resolved: "That in the opinion of this meeting as the London Building Act, 1894, sufficiently deals with the question of the storage of timber no fresh legislation is necessary for the safety of the public."

The Ventilation of the Houses of Parliament is to form the subject of an investigation by a Committee to be appointed before Easter. Samples of the atmosphere were taken by the Board of Trade officials last week.

Mr. Walter G. Doolin, M.A., F.R.I.B.A., of Dublin, died recently. He was the son of the late Mr. William Doolin, one of the leading quantity surveyors of his day. After an apprenticeship to his father he became a pupil of Mr. J. J. O'Callaghan, architect, of Dublin. From Dublin he went to London, where he entered the offices of the School Board, and afterwards became assistant to the late William Burges. He returned and started practice in Ireland early in the 'seventies. Amongst the many large churches erected from his designs we may mention Lismore Cathedral, Nenagh, New Ross, Castlebar, Killorglin, Castlemaine, Cloghane and Borrisoleigh.

Bricks and Mortar.

APHORISM FOR THE WEEK.

It is the test of Gothic sublimity to overpower the ridiculous without designing to hide it.

NATHANIEL HAWTHORNE.

Our Plates.

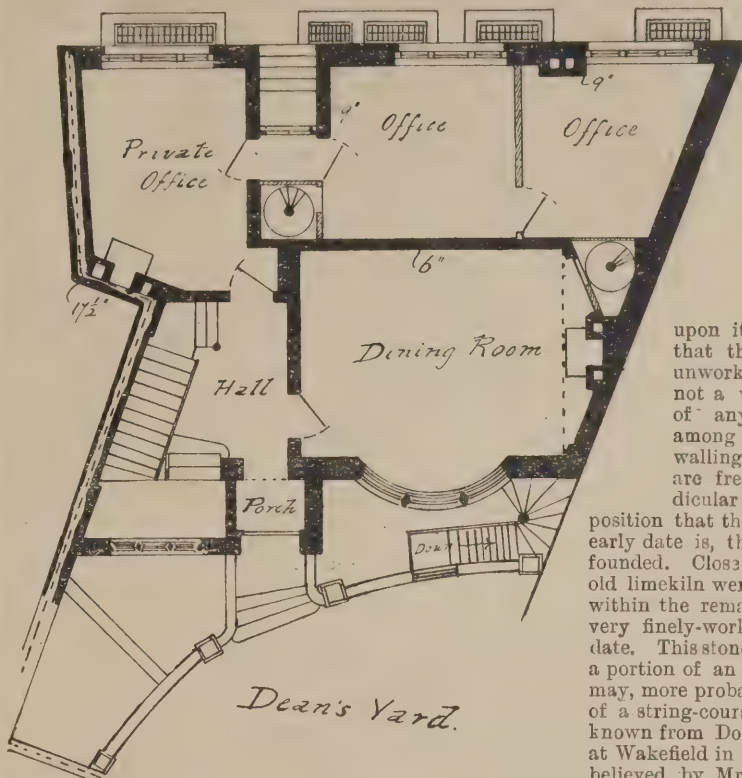

THE house at Sutton Coldfield was erected for Mr. C. E. Mathews from the designs of Professor W. R. Lethaby. The exterior is a direct expression of the plan, and has that peculiar interest and dignity which is attainable in no other way. The house is built of thin red Leicester sand-stocks, and roofed with hand-made tiles from Hartshill. The stables are built of common local bricks, but their bad shape and colour are successfully overcome by whitewash. It is interesting to note that, all inventions being open for modern use, Mr. Lethaby uses indiscriminately sash and casement windows in whatever place each kind is most convenient. But he uses no ornament which is not his own. In the inside there is some excellent plaster-work modelled by himself.—Phillimore House, Dean's Yard, Westminster, was erected for Mr. John Troutbeck, coroner for Westminster, and does double duty as a residence and coroner's offices. The residential part is entered from Dean's Yard, and, with the exception of a private door from the principal's office, is quite cut off from the official part. The latter is entered from the back of the house in Great Smith Street. The architect is Mr. George A. Hall, F.R.I.B.A. The building is of red bricks and Box Ground stone, and was built by Messrs. E. P. Bullen & Co., of Croydon, at the cost of about £3,000. There is a half-basement containing kitchen, servants' hall, pantry and usual offices; ground floor with dining-room overlooking Dean's Yard, and panelled hall; a staircase with panelled and carved oak newel posts; large drawing-room with moulded ceiling and parquet floor; boudoir and two bedroom floors above. The offices consist of:—In basement: Officers' room, approached from the general office by an iron spiral staircase. Coroner's private office. General and clerks' offices and typist room on the first floor, also approached by an iron spiral staircase.

Restoring the Castle of Chillon.

DURING the past few years the famous Castle of Chillon on the Lake of Geneva has been restored considerably. The wall and ceiling paintings in the Hall of Justice and Torture Chamber have been reconstituted. The Chamber of the Duke of Savoy still keeps good traces of its mural paintings and decorated ceiling; and these have only been cleaned, not retouched at all. In one of the courts excavations have disclosed the bases of columns which must have supported thirteenth-century vaulting of a massive type. The intention of the authorities is to make the castle a historical museum; and already some exceptionally good carved wood furniture of the fifteenth to the seventeenth centuries is deposited there.

Building a Lighthouse.

THE NEW LIGHTHOUSE which is now being erected at Beachy Head is intended to replace the house at Belle Tout. The new lighthouse is situated a mile and a quarter eastward of the existing lighthouse, on the highest portion of the sea-bed in this locality, and about 150yds. from the base of the cliff, which at this point is about 450ft. in height. The tide at this spot rises to a height of about 16ft. The base of the new building is 47ft. in diameter, and is built solid for about 47ft. upwards, with the exception of the space required for storage of water. The height to the top of the masonry is about 124ft. The whole of the stonework has been prepared and fitted at the quarries and sent by rail to Eastbourne. Thence by team and traction power it has been drawn to the works at the top of the cliff immediately above the new building, and then conveyed by means of the rope trolley-way to the works below. The cables over which the trolleys run are about 6in. in diameter and are capable of withstanding a strain of 120 tons, but the working strain never exceeds 30 tons. Some of the blocks of stone,

PHILLIMORE HOUSE, DEAN'S YARD, WESTMINSTER: GROUND PLAN. G. A. HALL, F.R.I.B.A., ARCHITECT.

which are of grey granite, weigh about 4 tons. Travelling over the cables to the stage below, they are then, by means of the cranes at the top of the tower, placed in position. The work was commenced in July, 1899. The excavations for the foundations, which are sunk deep in the chalk, could only be carried on while the tide was down. Blasting was not allowed owing to the danger of loosening the surrounding chalk bed and destroying its natural solidity. The structure has now reached the height for the lantern.

A Glamorgan-shire Church.

THE parish church of St. Bride's-super-Ely has been reopened after extensive restoration. The church has a splendid specimen of Norman work in its south porch, removed there from Margam Abbey fifty-five years ago. There is also a beautiful little niche, belonging to the fourteenth century, above the altar, but this probably formed part of a monastic building in the near neighbourhood. The chancel arch is a replica of the original Norman work, but unfortunately no traces of the original intention have been left to tell their own tale, a fact which applies also to the scale-work above the south door. It has a fourteenth-century saddle-back tower, tower arch and quaint old monuments. The east window was brought from St. Mary (Llanfair). The present work of restoration of the church includes the reparation of the tower, the addition of a vestry, wood-block flooring, re-seating the nave, heating apparatus, and generally putting the whole fabric into a thorough state of repair. The contractors who carried out the work were Messrs. Harries & Davies, the architect being Mr. G. E. Halliday, F.R.I.B.A., of Cardiff, the diocesan surveyor.

Discoveries at Wakefield Cathedral.

SOME interesting discoveries have been made during the past few days in the course of the erection of the extensions at the east end of Wakefield Cathedral. Besides making an extension of the existing chancel, and adding a Lady Chapel still further to the east, vestries and a chapter-house are being constructed below the level of the churchyard, completing the corridor, which gives access to the chapter-house from the church and the churchyard. A large amount of earth which was untouched by the preliminary excavations was removed from about the foundations of the remains of the east end. Here some walling,

which may have been the foundation of an earlier church on the same site, was discovered. The wall is of the roughest kind, with wide joints between the stones. Its face, which can be traced for about 3yds., follows an entirely different line from the perpendicular wall which partly stands upon it, and it is noticeable that the stones are entirely unworked, and that there is not a vestige of the remains of any destroyed building among the stones of this lower walling, while such remains are frequent in the perpendicular wall above. The supposition that the rough wall is of very early date is, therefore, probably well-founded. Close by, the remains of an old limekiln were found, and actually within the remains of this kiln was a very finely-worked stone of Norman date. This stone may either have been a portion of an abacus of a column, or may, more probably, have formed part of a string-course. There was, it is known from Domesday Book, a church at Wakefield in Saxon times, and it is believed by Mr. J. T. Micklethwaite, F.S.A., from evidences found in Sir Gilbert Scott's restorations, that it was rebuilt more or less completely "some time in the half-century of which the year 1100 is the middle." This stone is clearly of that date and confirms Mr. Micklethwaite's supposition.

Liverpool Cathedral: Petition Dropped.

IN a letter to the "Times," Mr. T. Myddelton Shallcross, hon. secretary *pro tem.* of the Liverpool Cathedral Petition Committee, says that as the object for which the Committee was formed has been attained through the discussion of the cathedral project which has taken place in the Press, it is not considered necessary to proceed further with a petition to Parliament. In the opinion of the Petition Committee it has been amply demonstrated that the present scheme for a cathedral in Liverpool is not the best possible one under the circumstances; "and this opinion having evidently received endorsement by the public generally, as evinced by the practical cessation of subscriptions to the cathedral fund since the Petition Committee put forward the facts of the matter, there is no great likelihood of a better fate for the Liverpool Cathedral Bill of 1902 (if sanctioned by Parliament) than befell that of 1885."

The New Cathedral at Westminster.

WITH regard to the future of the cathedral "The Tablet" says: "Every effort will be made to carry everything to completion along the lines which Mr. Bentley had planned. Fortunately he has left drawings and designs and colour schemes for the decoration of the cathedral in a very forward state of preparation, and it is not anticipated that those who were accustomed to work with him and for him, and had become familiar with his mind and knew the tradition of his office, will find any insuperable difficulty in giving complete expression to his idea. One thing, at any rate, is quite certain. It is Cardinal Vaughan's hope and wish that the whole of the great fabric shall bear upon it the impress of the mind which designed it. Mr. Bentley lived with the cathedral and for the cathedral, and he lived long enough to leave behind him plans for the decorative treatment of the building, which it is hoped may still be carried out in their entirety."

A New Post-Office at Ferryhill, Co. Durham, is to be erected. It will include a residence for the postmaster. The architects are Messrs. Plummer & Burrell, Grey Street, Newcastle, and the contractor is Mr. J. W. Lazenby, of Ferryhill.

R. I. B. A.

PLANNING OF AMERICAN LIBRARIES.

A MEETING of the Royal Institute of British Architects was held last Monday, Mr. William Emerson presiding. The decease of Sir Richard Temple, Honorary Fellow, Mr. George Frederick Judge, Fellow, and Mr. Walter G. Doolin, Fellow, was announced. Mr. Emerson then announced that the King had decided that the Royal Gold Medal should not be given to the family of the late Mr. J. F. Bentley, as it would create a somewhat objectionable precedent. The Council would therefore have to consider the names of other gentlemen for the selection of the Royal Gold Medallist for the year.

Mr. Sidney K. Greenslade, A.R.I.B.A., then read a paper on "The Planning of Some Recent Library Buildings in the United States," of which the following is a summary:—

The development of the library movement in America during the last ten years had been so enormous that few buildings erected previous to 1885 would be found to-day suitable for modern requirements. The librarians themselves have settled points in the policy of the working of libraries which previously were undetermined, and it was the very active interest of these men which had so greatly assisted the architects to produce such very fine plans. Mr. Carnegie's generosity had helped forward the movement wonderfully. Last year alone he gave more than £2,500,000 for new buildings. The result was that the American architect had unequalled opportunities, and was showing the greatest interest in his work. At present some of the recent plans seemed as perfect as possible, yet the interest in the subject was so great that new developments were sure to take place.

The author went on to treat of various representative libraries under the following heads: (1) Reference Libraries; (2) University Libraries; (3) Town Libraries (in three divisions); (4) Branch Libraries; (5) Small Libraries.

In the first group was placed the Library of Congress at Washington, by far the largest library building in the States, being 470ft. long by 340ft. wide, with four great inner courts. The site was acquired in April, 1886, and Messrs. Smithey & Pelz's plans were adopted, but no limit of cost was fixed. By the summer of 1888 Congress, dissatisfied with progress made, lodged the entire control of the work, including preparation of new plans, in the hands of General Casey, Chief of Engineers of the United States Army, to be erected at a total cost of £1,300,000. It was finally completed in 1897.

The design for the New York Public Library, now being erected, is the result of two competitions held in 1896 and 1897. In the limited second competition twelve firms of architects were selected from those competing in the preliminary open competition, out of a total of eighty-eight. Tentative sketches of the plans of each floor were issued with the instructions. The assessors (with those elected by the competing architects)—Professor Ware, of Columbia University; Dr. Billings, the librarian; and Mr. Bernard R. Green, of the Congressional Library—finally selected a design which practically adopted the whole of these suggestions. The site allows of an isolated building with ample space for future extension, 455ft. frontage and 482ft. to the sides. The cost was not to exceed £340,000 without fittings, but it is estimated now to come to £660,000. The library will have shelving capacity for 2,000,000 volumes, and seems nearly as perfect a library as possible. Messrs. Carrère & Hastings, of New York, are the architects. The State Historical Library building at Madison, Wis., is an extremely well-planned building, and forms an ideal reference library. It is to house 675,000 volumes (architects, Messrs. Ferry & Clas, Milwaukee).

Of University libraries, those of Columbia and New York are particularly worthy of attention. They are not unlike in plan, both in general outline taking the form of a Greek cross. The great central reading-room—in one case octagonal and in the other circular—is the motive of the design in both buildings. Special study-

rooms, with their books stacked around them or near them, are an important feature of both libraries, and in each are treated in a different way. The Columbia University Library is, perhaps, the most monumental of those yet erected in the States, with its magnificent domed reading-room, placed at the intersection of the arms of the cross, octagonal in form, the four sides at the angles being shorter than the others; it is evident that to obtain architectural effect utilitarian points have been somewhat sacrificed, particularly in the storage of books and the difficulty the staff has in handling them. Its total shelving capacity is 1,050,000 books; the cost was £240,000 (architects, Messrs. McKim, Meade & White, of New York). The library of the University of New York (also by Messrs. McKim, Meade & White), though much smaller than the Columbia University Library, is in some ways more compact in plan. Its domed reading-room is circular on plan, and the books are stacked round about it and not below, and are generally more accessible.

The library of the Law School at the University of Pennsylvania had a remarkably well-arranged and convenient plan. The architects were Messrs. Cope & Stewardson, of Philadelphia.

Town libraries the author dealt with in three divisions—under Division I., Large Town Libraries, being grouped the Boston Library, Newark Public Library, Providence Public Library and Washington Public Library. In each of these buildings the motive of the design has been a different one. They all, however, evidence the growth of the free access policy and its great effect upon the plan. Not only is it necessary for the general reading-room to have, as in the Bates Hall at Boston, the walls shelved for books of reference, but the borrower must also be allowed shelves to select from. The excellent plan is adopted at Newark of placing open shelf-rooms on either side of the delivery hall, where thousands of books may be stacked. At Providence the shelves are placed between the entrance hall and the delivery space—not so good a method; still, the floor area at this point is so ample that the whole could be rearranged with advantage. In Newark the stack-rooms are nearly isolated—a great advantage should here occur in the main building. The Boston Library (Messrs. McKim, Meade & White, architects), one of the first great monumental libraries (begun in 1888), was opened in 1895. The building cost £473,000; its present shelving capacity is for 750,000 volumes. The Public Library at Newark (designed by Messrs. Rankin & Kellogg, Philadelphia) was only completed and opened in March, 1901. A great point has been made of "free access" to the books, both outside and inside the stack. There are some excellent points in the planning of the building. The arrangements for the open shelf rooms, delivery hall, work delivery space and stack-rooms are very good indeed, and the approach to these rooms from the main entrance is very direct. The cost of the building was £60,000. The Public Library building, Providence (designed by Messrs. Stone, Carpenter & Wilson), was completed and opened in March, 1900. A serious attempt has been made to meet the new requirements of the "free access" policy, and to a large extent it has been successful. The cost of the building was about £53,000, and the shelving capacity is for 225,000 volumes. The design for the Washington Public Library building was the result of an open competition. Ten well-known library architects were invited to compete, each receiving an honorarium of £50. Other architects were also allowed to send in schemes, and the result was that the plans of Messrs. Ackerman & Ross, of New York, were selected (not an invited firm). The cost was limited to £50,000, but this was overstepped considerably, the total estimated cost being £70,000. Building operations were commenced in August, 1900.

The following town libraries were treated in Division II.—The Carnegie Library, Atlanta, Georgia (architects, Messrs. Ackerman & Ross, New York); the Carnegie Library, Davenport, Iowa (architect, Mr. W. A. C. Jackson, New York); the Pawtucket Library (architects, Messrs. Cram, Goodhue & Fergusson, Boston); and the Public Library, Fall River, Mass. (architects, Messrs. Cram, Wentworth, & Goodhue, Boston).

At least two distinct types of town libraries occur in the libraries illustrated in Division II. The Atlanta and Davenport represent one and the Pawtucket the other. The latter has only a basement and first floor; the others have an additional floor. The open shelf-rooms adjoining the stack-room and either side of the delivery space are an excellent feature in the Atlanta library. The Utica library has not been erected yet. It seems to come midway between the above types. All the important rooms are placed on the first floor. Among points worthy of note are the position of reference spaces (10ft. wide) on each floor of the stack-room; the important position of the children's-room, which balances the general reading-room; and the provision for special study-rooms. The average cost of libraries of this size is £20,000 to £50,000.

The author next discussed the third division of town libraries. The effect of the "free access" policy is well illustrated in the three libraries selected as examples, viz., the Carnegie Library, East Orange (architects, Messrs. Jardyne, Kent & Jardyne, New York); the library at Duluth, Min. (architect, Mr. A. Rudolf); and the Public Library, Tacoma, Washington. The tendency to do away with walls and substitute columns with glazed screens between is a feature in all of them. In the East Orange and the Tacoma libraries the use of the radiating stack is new for a large building.

The system of branch libraries and stations is remarkably organised in many of the large towns. Mr. Andrew Carnegie has given £1,000,000 to build sixty-five new branch libraries in New York, and the Board of Library Trustees have just appointed three firms—viz., Messrs. McKim, Meade & White, Messrs. Carrère & Hastings, and Messrs. Babb, Cook & Willard—to take the entire charge of the designing and supervising of these buildings. These firms will confer and collaborate in the work.

Up to the present time the planning of the branch library has been studied, perhaps, in Pittsburg more successfully than in any other town in America. There are five branches already erected of the seven presented by Mr. Carnegie, each on an isolated site (architects, Messrs. Alden & Harlow). The growth of what may be called the "turnstile control," resulting in the abandonment of the entrances to the reading-rooms from the delivery hall, as adopted on the first plan, is important. The apparent unfitness of the low railing separating the reading-room from the delivery hall, as adopted in the West End branch, and substituted afterwards by screens in the later plans, is also worthy of note. Although the radial-stack plan is costly to build, yet the advantages where a "free access" policy is adopted are very great.

The requirements of small libraries have been particularly well studied in the State of Massachusetts. Hardly a village or hamlet is without one. The author selected for description the little library at Wayland, Mass. (architects Messrs. Cabott, Everett & Mead, Boston); the Russell Library, Plymouth, Mass., by the same architects; and the library at Weston, extremely convenient and well-arranged for its purpose (architect, Mr. Jenny, Boston).

Professor Beresford Pite proposed a vote of thanks to the reader of the paper. Mr. Quinn, librarian, said he was struck with the way in which the American architects had made everything subservient to economy of administration, which was perhaps more an essential in this country than in the United States. The reason the important rooms were placed on the first floor was chiefly that it had been found that tramps and loafers were adverse to going beyond the ground floor, and another advantage was that quietness was best assured there. In this country the penny rate was a very serious drawback to good public libraries.

Mr. Osmond Smith seconded the vote, and Mr. William Emerson also spoke.

Mr. Greenslade in reply said the children's rooms, though so large, were generally filled, and school books were provided in them and children came and prepared their lessons. Special rooms were also provided for teachers who brought classes there. It was surprising how the libraries though so large were filled with books of a most extensive and practical range.

STRUCTURAL COLOUR DECORATION IN PUBLIC BUILDINGS.*

By GERALD C. HORSLEY.

THE subject which we are now to discuss may, I think, be said to embrace those many systems of decoration which by their nature are one with a building or an actual part of it. It does not include those likewise numerous forms of decoration which are easily removed from the building they are intended to adorn. For instance, the Pallazzo Pubblico at Siena, with its large frescoes, comes within our view, but the great council hall at Venice, on the walls of which are stretched the largest canvases in the world, including the Paradise of Tintoret, however much we may admire them, does not.

We may consider our subject in two parts or divisions:—(1) Those buildings whose actual materials form a colour scheme, such as the Duomo at Siena. (2) Those buildings which have been so decorated that the colour is made one with the materials of the building, such as S. Francesco at Assisi or the Borgia apartments in the Vatican. But, of course, these two kinds of decoration overlap and react upon one another.

English Decoration; the Succeeding Foreigners.

Unfortunately there are but few public buildings in this country which have any structural colour decoration, there being little demand from the public for works of the kind. It is a remarkable fact that since the sixteenth century in England the practice of decorating in colour all our buildings, both public and private, as a natural and expected action, has declined. The late Professor Middleton has said of English art from 1260 to 1320:—

"The painting of England was unequalled by that of any other country; even in Italy, Cimabue and his associates were still labouring in the fetters of Byzantine conventionalism, and produced no works which for jewel-like colour and grace of form were quite equal to the painting under Edward the First."

Encouraged by kings such as Henry III., and by the Church, English artists decorated Canterbury, Westminster, Salisbury and countless buildings throughout the land, but the coming of the Renaissance from abroad, the fall of the Church and the growth of Puritan feeling seemed to paralyse the development of native decorative art. Moreover, little belief in our powers was shown by those in high places, by those able to commission and encourage. Was sculpture needed, or painting, the artists must come from abroad. Torregiano must make the king's tomb, later Rubens alone can paint the roof at Whitehall, just as Vandike must paint the portraits, Verrio must paint the ceilings and walls at Hampton Court. Though, through it all, there were English painters, whose works we know, and many art craftsmen, the English artist was eclipsed by the superior skill of the foreigner. With the advent of Wren, the great English master, we find our countrymen again employed in important work, Streater in the Sheldonian at Oxford, and, still later, Sir James Thornhill at St. Paul's and at Greenwich.

It has been said that the revival of letters 400 years ago made it no longer so necessary that the walls of public buildings should furnish a literature for the people, and thus a great incentive to noble, historical and allegorical painting died. Together with the sciences, the painters became learned and conscious. Architecture thought more of itself and less of the other arts which had previously combined with it to form an organic whole. If she used painting, it was more as a mistress employs a handmaid, and less as an equal co-operating with an equal, and painting apparently would have it so. Instead of covering wall surfaces with representations of noble deeds by great men or pictures portraying the mightiness of virtue and the baseness of evil, as in the days of Giotto and Lorenzetti, she wasted her powers in extravagant flatteries of her employers, such scenes as we see Rubens painted for Marie de Medicis, the Apotheosis of James at Whitehall,

and the foolish scene of Olympus, by Verrio, at Hampton Court.

We cannot imagine a more half-hearted, or more selfish condition of things, or one more contrary to the spirit of the great days of art. It is at any rate to the credit of English architects that they have all along recognised—and with much fulness of late—the harmfulness of the position.

On the other hand, we have also to notice that the Continent has never lost in the same degree as ourselves its interest or delight in the use of colour decoration. In Italy to this day a colour scheme in a new building has a prominent place. In France a church, a mairie, or a theatre, even a railway station,* is not considered complete until it is painted in tempera or with canvases, *marouflé*, so that they form part of the building. Such conditions as these may also be found in Germany and Austria. England alone seems with but few exceptions to disregard colour as a necessary element of beauty in the designs of the interior of her public buildings.

Butterfield and Street.

But it is time to discuss the two divisions I have mentioned. First, those buildings whose actual materials form a colour scheme. This is a method of decoration which was more in favour with the last generation of art workers than it is with us at the present day. We are reminded of the buildings of the "Gothic revival," of the works of Butterfield and Street. These buildings were the result, no doubt, of visits to Italy, where their prototypes may be found, also of a study of our own Gothic period, when a certain amount of parti-coloured wall work was done, brought to us by the mediæval current of art practice from east to west. Modern churches like All Saints', Margaret Street, and Keble College Chapel, by Butterfield, and the church in Garden Street, Vauxhall, by Street, are buildings of this type. We must remember that when Butterfield did this work it was a great achievement, a deliberate attempt at a human expression in art, and a clean break-away from the (to him) cold and formal, dull and vacuous interiors of 1845. In "All Saints'" he has done this, his first essay in the manner, with consummate skill and largeness of feeling, better than at any later time and better than any of his imitators, and there were many who followed his lead. Few artists ever took such great pains or had such great gifts as William Butterfield. We must not think that he introduced this coloured work with the sole intention of breaking up the appearance of the wall surface. This was clearly not his main idea. With the "true principles" of the neo-Gothic architect—and here I think we have the principle underlying so much of this work—his aim was to get a permanent wall decoration, one which would outlast the usually improperly-made plaster wall-covering. He recognised the difficulty and expense of securing any form of painted wall decoration, also the deleterious effects upon any painted surface of the fumes from gas lights and oil lamps, and the lively-charged atmosphere of London and our great cities. He set himself, therefore, to produce something suitable, lasting and easily kept clean. He did this admirably.

The Schemes in All Saints', Margaret Street, and at Keble College.

In All Saints', Margaret Street. First there is a tile dado of full colour about 5ft. high, above large scenes from the New Testament painted on tiles. Above the arches of the nave arcade the wall-surface is stone inlaid with bold patterning in tiles and dark inlay. On the east wall only is there any painting. Here are frescoes by Dyce in panels spaced between margins of alabaster. The roofs are vaulted and painted in the chancel, and there is painted wood in the nave. With the exception of the pictures on the east wall there is not a scrap of plaster in the church, and no one will deny that the scheme is interesting and good. In Keble Chapel there is a very similar scheme, but in materials more precious, as befits a college chapel of such importance. Here the lower part of the wall has an arcading of stone, with the spandrels formed of coloured bricks. Above a

height of about 10ft. from the floor are pictures in mosaic framed in stone. The pictures form a large and striking frieze running round the chapel; above are the windows filled with painted glass. Between and above these are more bands of coloured brick. The roof is vaulted, painted to represent stone. Here again, therefore, except in the painted roof, the ground of which I suspect is in well-made plaster, there is no plaster used, and the whole effect is one of great dignity. To our eyes nowadays such a method as this would require to be carried out on the broadest and simplest lines; we should also demand that the materials should be worthy. The black, white and yellow bricks of fifty years ago have few charms for us now.

The system of alterations of colour in a wall-surface fits in with the natural demand of the eye, which welcomes and recognises the propriety of variety in colour. It is open to us, therefore, to appropriately use the differently coloured stones we have or our own native marble, while, thanks to the discovery and re-opening of some of the old Greek and African marble quarries by men of energy and foresight like Mr. Samuel Brindley, of Messrs. Farmer & Brindley, ancient sources of supply are no longer closed to us. So long as we arrange the materials at our hand, be they of clay or stone, with breadth and simplicity, we shall be treating them with the dignity they deserve; and in buildings of importance we shall, I think, be treating ourselves with greater consideration if we invest our patterns with some meaning and intention. In passing I may point to the Baptistry of Florence, San Miniato at Florence, some late Roman examples at Ravenna, as being particularly successful examples of the use of marble in this connection. The cathedrals of Orvieto and Siena are direct descendants of the striped work of the Saracen builders, a method of building common in the East to this day and dating from her immemorial history.

The Houses of Parliament.

The second division of our subject—"those buildings which have been so decorated that the colour is made one with the materials of the building"—offers a larger field for examination. Who can read the story of the preparations for decorating the Houses of Parliament fifty or sixty years ago without amazement and astonishment at the ignorance of and want of confidence in the capability of the painters of that time by those in high authority. For about twenty years a Royal Commission was in existence to consider and decide upon the best means of painting certain panels and rooms in the new Palace of Westminster. They instituted open competitions, invited cartoons, called for samples of painting in fresco. They doled out a few commissions. The expense incurred in preparing for these competitions and trials in painting must have brought many artists to the verge of ruin, and the many delays and slow procedure disheartened and crushed the spirit of all. If anyone wishes to read the sad story of these years let me refer him to Redgrave's "Century of Painters," where the whole history is set forth by one who lived during the time and knew it well. It may be that the Government of our country is too complex and vast an institution to see and use the advantage of departing from the competition system and to trust with commissions artists whose works and capabilities are known. The few examples of such a departure we have had have been signal successes. I may refer, as an instance, to the employment of the late Lord Leighton in the frescoes "Arts of War" and "Arts of Peace" at the South Kensington Museum.

Decorative Work in the Provinces.

Fortunately, the experience of the working of the Houses of Parliament Commission I have referred to has served as a warning throughout the country to municipalities and to individuals, and no doubt it has been easier for municipal councils to foster and encourage the arts of the country, with their less cumbersome governing machinery, and to avoid the many mistakes it is possible to make in the fit decoration of a building of importance. Manchester is most fortunate in having commissioned Ford Madox Brown to paint the scene from her history in panels in her Town Hall. Glasgow is employing some of her own sons, Messrs. Henry, Lavery,

* A paper read before the Society of Arts on March 4th, 1902.

* The new Gare D'Orleans, at Paris, which has two large wall paintings of "Biarritz" and "The Loire" in the waiting hall, by Cormon, membre de l'Institut.

Walton and Roche, in her city buildings. The Corporation of Liverpool, acting wisely on the advice of their architect, have commissioned Mr. Charles Furse to paint the pendentives of their large dome, illustrating scenes from the commercial greatness of their town. Birmingham has commissioned some of the students of her Municipal School of Art to paint scenes of history in panels in the Town Hall. The Corporation of Colchester also, in the new Town Hall, on the advice of their architect, Mr. Belcher, is employing the master of her art school to decorate the council-chamber and Moot hall, under his supervision and with his assistance. In London, in our own Royal Exchange, the Corporation of the City of London, together with some of the great City companies, have commissioned artists to paint the panels of the ambulatory.

For some years past the municipalities of our towns have been fostering a love and appreciation for our arts by buying pictures and placing them in suitable galleries. This virtue of acquiring beautiful things has now been supplemented by the further step forward in giving commissions for mural painting. In the placing of these commissions we have the greatest hope and encouragement for the future, and with the increase of the municipal councils which is taking place in our midst we may look to see full advantage taken of the opportunities the public buildings present for the employment of artists of proved power and attainment, to the advantage of the people of this country. With this hope in our hearts, we may consider with greater interest certain of the methods of works which at the present time are in use.

Marble, Mosaic, Plaster, Stucco, Sgraffito.

Before speaking of different forms of painting available I would like briefly to touch upon the possibilities offered to us by the use of marble, mosaic and plaster, stucco duro and sgraffito. These are so closely allied to the first division of the subject that I would speak of them here. We know that the Egyptians, Greeks and Romans used colour largely in their buildings, but we can have but little idea of the magnificent effects often attained by means of their fresco painting, encaustic painting, tempera, modelled plaster, mosaic, marble linings and veneering, bronze, ivory, gold and silver overlaying and inlaying.

For instance, we read of the Golden House of Nero that the walls were encrusted with gems and mother-of-pearl, of banqueting-halls having ivory ceilings; of a ceiling in the State dining-room which was spherical in shape and cut in ivory to represent the constellated skies, and kept in constant motion by machinery in imitation of the stars and planets. This magnificence, inventive and symbolic, partook something of the marvellous and the rare qualities which we have far to seek in this prosaic age. Of their large halls, basilicas or baths it was also a custom of the Romans to line the walls with marble slabs to a considerable height, and above to use mosaic or plaster reliefs. The vaulted ceilings were generally coffered, and decorated in plaster reliefs, coloured and gilt; bronze rosettes were also used in the coffers.

This was a general form of decoration throughout the Roman Empire both in the West and East. We find it used by the Byzantine builders, in Constantinople, Sicily and Italy, and we may be of opinion that few finer schemes of decoration than this have ever been devised. In some manner adapted to our modern needs, it is available to-day, and it is understood that the principle is to be adopted in the new Roman Catholic Cathedral at Westminster.

Modern Mosaic.

In considering the use of mosaic at the present time we may hope that the modern and vicious habit of preparing mosaic tesserae face downwards on a sheet of paper laid on a flat table and then pressing the sheet of paper into position has been finally given up. Forsaking the old and only right method of fixing each tessera into the cement pushed in by hand from the front, too many works of the last century are deficient in one of the most important elements of decoration, namely, the right technique. Sir William Richmond has shown in the work which he has done that there is no more trouble and no appreciable loss of time

in doing mosaic work in the only true way, namely, pushing it in tessera by tessera from the front. His assistants after very little practice have been able to do the work on these lines with the greatest rapidity, and naturally with intelligence and interest in seeing their work in position as it proceeds.

Time will not permit me to speak of modelled plaster and sgraffito in any detail, except to express the satisfaction we must all feel that these ancient arts of tried quality are understood and worked in a modern spirit to-day. The composition of

Stucco Duro

has been often described, and we know by the remains of ancient Roman work found in the Villa Farnesina, and of the works of the sixteenth century in the Loggia of the Vatican, and the Villa Madama, and other buildings in Italy and France, what exquisite possibilities this material presents. The work, particularly in the early Renaissance, was usually decorated in colour. This was generally laid on whilst the stucco was wet, as in fresco, and the details heightened with tempera or encaustic colours, and accessories enriched in gilt gesso.

We may congratulate ourselves that artists like Mr. George Frampton and Mr. Anning Bell have worked in this material in churches and other buildings in our time. The processes of stucco duro and sgraffito are fully described in the "Arts and Crafts Essays" published in 1893, the former by the late Mr. G. T. Robinson, and the latter by Mr. Heywood Sumner, whose work in All Saints' Church, Ennismore Gardens, affords an example of modern treatment. I need not do more than name these two forms of lasting decoration, peculiarly structural and available to us to-day.

Buon or True Fresco :

And now as to the principal methods in use by painters at the present time. Probably the world has never seen a more beautiful method of painting than Buon or true fresco, but, alas, its use has not been fully justified in this country. The Royal Commission I have just referred to took a good deal of evidence as to its suitability for the decoration of the Houses of Parliament. A number of painters of eminence spoke against its being attempted. They advocated the use of oil colour. But the Commissioners, perhaps dazzled by what were then considered the triumphs of modern art, the frescoes at Munich, decided that the new paintings should be in that method.

Dyce, Cope, my father, and one or two others, were successively commissioned. Exposed, however, to the bad air of their surroundings, these works have in some cases suffered beyond repair. So doubtful were the painters themselves as to the suitability of the scheme that when Maclise was commissioned to paint the walls of the Painted Chamber he, with the sanction of the Commissioners, proceeded to Germany in order to make researches into the practice of stercochrome or water-glass painting. The result was that he adopted the process in the large wall painting "The Meeting of Wellington and Blucher after the Battle of Waterloo"; it was also adopted by Mr. Herbert, who was then engaged on other wall-surfaces in the palace.

Its Composition.

You will permit me to remind you of what happens in Buon fresco. The powder colours mixed with lime-water are applied to the last and freshly-spread coat of plaster before it has had time to absorb more than a trace of carbonic acid from the air. The painting ground is in fact saturated with an aqueous solution of hydrate of lime, that is, slaked lime, while there remains a large reserve of this compound in an undissolved condition. When on such a surface a layer of pigment mixed with water is placed, as that water evaporates the lime-water in the ground diffuses into the paint, soaks it through and through, and gradually takes up carbonic acid from the air, thus producing carbonate of lime which is the actual binding material.* The whole painting gains in this chemical action, appearing to absorb light and to reflect it on the sand facets of the ground to the spectator.

But, unfortunately, and here I again quote

* I am indebted to Professor Church's "The Chemistry of Paints and Painting" for this description.

from Professor Church's interesting book, "the protection afforded to the pigments by the binding material, this carbonate of lime, is not generally very efficient. In the case of a dry wall, free from soluble saline matter, and exposed to a pure atmosphere, it may remain good for centuries. But in air contaminated with the products of the combustion of coal and gas, and with tarry and sooty impurities, a fresco picture soon perishes. The binding carbonate of lime is converted into the sulphate, breaking up the paint. The same causes will form sulphate of magnesia from the carbonate of magnesia in the plaster, and the paint will scale off."

In our large towns therefore to-day Buon fresco has no chance of lasting.

The Stereochrome or Water-Glass Process

consists in spraying the painting after completion with a warm dilute solution of potash silicate, or potash-soda silicate, which is obtained by fusing the purest sand obtainable with carbonate of potash or carbonate of soda. The pigments themselves are mixed with some of the fixing liquid. This form of painting is a German invention of comparatively recent date; it has not been frequently used in this country, and we have very little experience of its behaviour.

Tempera Painting.

In the consideration of the possibilities of tempera painting we find ourselves on surer ground, no longer so fearful of the consequences of the contaminated atmosphere of our towns. I am glad to be able to read you a few words I have received from Sir William Richmond as to this medium which he used on the walls of a modern church at Cheltenham a few years ago. He says:—

"The wall was prepared with lime and sand—the final in tonaco was in marble dust and well, slaked lime, and it was wonderfully white. The whole design was drawn in charcoal, corrected with care. Egg, capric wine and powder colours were used. The yoke of egg alone was used, plenty of wine and distilled water. The first painting should be in what the Italians called 'Verdaccio,' namely, raw siena (black and white), with plenty of impasto. In two hours this can be glazed with warm colour and painted into. I am quite certain that the yolk of egg and wine form the very best and most durable medium for wall painting. Most of the Italian wall paintings which have lasted were not painted in fresco, but in the tempera of yoke of egg, the essential oil of which is a most powerful binding liquid, enabling the painting to dry like a rock."

Sir William further says:—

"I prefer yoke of egg and wine, even to Buon fresco, the colour is almost as pure, not quite so light, and if it is necessary to get rich colour the medium will give it to any extent."

Professor Church, speaking of the large amount of oil in the egg yolk, says, "This vehicle does not act so effectively as oil and varnish in locking up pigments, and so the protection against change which it affords is less." But I think we may take it that the protection is certainly considerable, while the old method of varnishing the painting with sandarac in oil affords further protection against moisture and impure air.

Spirit Fresco.

The well-known spirit fresco, invented by the late Mr. Gambier Parry, differs little from ordinary oil painting on account of the large quantity of oil in the copal, which forms so much of the medium, the constituent parts of which, I may remind you, are only multiple of these proportions:—

	Ozs.
Gum elemi or elemi resin	2
Pure white wax (beeswax)	4
Oil of spike lavender	8
Finest preparation of artists' copal	20

With this medium incorporated by heat all colours in dry powder are mixed. It appears that Mr. Gambier Parry gave the name of spirit fresco to the method because oil of spike and turpentine may be freely used as liquids during the process of painting. The beeswax secures, of course, a perfectly matt or dead surface, but it is liable to produce a kind of bloom in the course of years, and may wholly disappear in the course of time.

Besides the paintings by Mr. Gambier Parry

at Higham and Gloucester Cathedral, Lord Leighton's "Arts of War" and "Arts of Peace" at South Kensington, and seven paintings by Ford Madox Brown in the Town Hall of Manchester, are examples of this method. They appear to be standing well, though we may expect them to darken, and there are a few signs of the bloom referred to above in the "Arts of Peace."

Professor Church considers that a sound medium is to be found in the proportions of—

	Ozs.
Oil of spike - - - - -	12
Paraffin wax - - - - -	4
(The two mixed by heat.)	
Copal picture varnish - - - - -	20

He advises the pigments being mixed in brown linseed oil, rather than in the medium itself as PARRY recommends.

Wall Paintings on Canvas.

I have dwelt on the component parts of these wax and oil mediums in some detail, as it is but a step from them to the method which is generally adopted by painters to-day. I refer to the prevalent custom of painting in oil on canvas, and then, on completion of the picture, having it fixed, or *marouflé* as the French call it, to the wall or ceiling; that is to say, the canvas is fixed by means of a thick paste of white lead oil and copal varnish, spread upon the wall and simultaneously upon the back of the canvas.

The French painters in the beginning of the nineteenth century, like their German brethren in Munich, painted mural works in fresco, but they were already beginning to discard the practice when we, in our wisdom, were working in it at Westminster. They also used encaustic painting (Delaroche's Hierarchy in the Ecole des Beaux-Arts is an example), but since 1870 the most important works have been painted on canvas fixed in the way I have described; such are the great wall paintings by Puvis de Chavannes in the Pantheon, Amiens, Rouen, Lyons, The Sorbonne and the Library in Boston. This, too, is the method adopted in the Royal Exchange, at Liverpool, at Glasgow, and by Messrs. Sargent and Abbey in the Library at Boston.

Without going deeply into technicalities which would naturally vary with each painter, the colours used are simply oil colours, with a medium of wax and turpentine. Professor Moira, who has painted in this way at the New Renshaw Street Chapel in Liverpool and at other places, tells me he likes the canvas to be fairly coarse and open, so that there should be no hindrance to the fixing material incorporating itself with the colours laid on. This is better achieved by doing the first painting only in the studio, and completing it *in situ* after it has been fixed upon the wall or ceiling. The painting of the picture *in situ* in this way will I am sure commend itself to all as a most important side of this system of decoration. It is understood that some of the modern works I have named have been painted entirely in the studio; corrected in many cases no doubt when in position. But as a practice it must surely carry with it its own condemnation. Although scale drawings and models may be made with the utmost care, and cartoons in full-size tried in position, all of which should be done and invariably is done before the painting is begun, unless the work or at least the major part is carried out in the building, it is not possible for the painter to be confident as to the correctness of his scale or, what is more important in its difficulty, of his colour. Both these elements, more particularly the last, must surely be influenced by the size and lighting of the building, an intimate knowledge of which is revealed by working in it. Are we to suppose that the ceiling of the Sistine Chapel would have been so magnificent as it is if it had been painted in a studio and then fixed in position? I confess the very thought is sacrilegious, and I tremble at suggesting it.

In this connection I am reminded of a painting on canvas which was painted chiefly on the wall, where by its position in a dark corner of a church certain colours had to be used which are startling in what would be their inappropriateness in a better light. For instance, in order that the hair of the Saviour, one of the figures in the composition, should appear brown, pure

BELLFIELD HALL, ROCHDALE. DRAWN BY W. EATON, A.R.I.B.A.

vermilion had to be used; ordinary light brown appeared black.

But it is unnecessary to multiply instances, and I would venture therefore only to suggest that as in most cases the position of the painting so implies the colour to be used, that it is desirable the painting should as far as possible be painted *in situ*.

It is to be hoped that the convenience of this modern method of wall painting will not deter painters from working directly on the plastered wall in tempera, oil or encaustic. If the beautiful qualities of fresco are denied to this country, there are yet the qualities inseparable from a plaster ground which a canvas surface can never, I think, present quite in the same way.

Design I need not touch upon. There is no excuse for bad work, surrounded as we all are by the highest example. A fine translation of modern life appears to be growing in mural painting of the great type, and is heartily to be welcomed. In this connection I would draw attention to Mr. Furse's work at Liverpool, and some of the work at Glasgow, while in allegory we have the great work of Mr. Sargent at Boston. In setting ourselves a standard we may remember perhaps the words of Puvis de Chavannes: "Toute décoration ne peut être belle que dans la mesure où elle reflète la Nature et en traduit la passion."

Bellfield Hall is near Rochdale and adjoins the ancient village of Newbold. It is one of the very few halls in Lancashire on the quadrangular plan. It was built at various times, but chiefly during the reigns of Henry VIII. and James I. The sketch on this page shows the north-west angle of the quadrangle. The ancient banqueting hall has windows of enormous size, with sixteen lights in the width. A number of the rooms are now divided by brick walls and are used as cottages.

Longstock Parish Church.—A faculty for a rood screen in Longstock Church has been granted. The church was erected in 1880 from the designs of the late Mr. William White, F.S.A. A rood screen was included in Mr. White's original scheme. Messrs. Harry Hems & Sons, of Exeter, are carrying out the work, which will be entirely in Hampshire grown oak. Mr. Harry Hems was for considerably more than thirty years the chief craftsman employed by Mr. White to carry out the artistic portions of his many works at home and abroad, amongst other places at the cathedral upon the island of Madagascar, and all the carved and sculptured work upon the general fabric of this church was executed by him under Mr. White's supervision.

ROBERT ADAM.

AT Leighton House, Kensington, Mr. Percy Fitzgerald lectured last Wednesday on Robert Adam, architect and artist. He said the memory of Adam would be most cherished as architect of the Adelphi, where all the qualities of picturesqueness, homogeneity and dignity were exemplified. The front of the Society of Arts was, for instance, incomparable for the spirit of cheerfulness and animation which entered into the design. Another striking example was Alliance House, which for ornamentation was unique. In fact, remarked Mr. Fitzgerald, no one knew what wonderful architectural genius was displayed in creating the Adelphi—the terrace, the tiers and the underground arrangements—until they investigated it, and it was gratifying to admirers of Adam that his name should be kept green by "Adam Street," and that his brothers should be remembered in the nomenclature of adjoining thoroughfares. Adam's genius asserted itself at a time when the heavy classical style of architecture was in vogue, and although he (Mr. Fitzgerald) did not disguise the fact that there were those who objected to Adam's style, yet it was reassuring to know that it had held its ground for 140 years. Indeed, he was glad to note a sign of the revival of Adam's ideals both in architecture and decorative work. Warrings, Ltd., had, he was glad to say, done a good deal in this direction, and it was appropriate that one of the rooms at the Hotel Cecil, which he believed had been named after Adam, should have been decorated and fitted up entirely on his ideas. Some examples of Adam's work were to be found in Fitzroy and Bedford Squares. Lansdowne House was, in his opinion, one of Adam's triumphs in town residences; and of palaces he knew nothing to compare with that in Osterley Park—a distinguished Jacobean structure in which Adam's ideals had full play. But Adam was not merely an architect of distinction—he was an artist of the first water. His decorative work was characterised by great elegance, his work in iron had certainly never been surpassed for beauty, while his furniture rivalled that of Chippendale. His work in metals was not confined to large objects—he even devoted himself to door-knockers and to the knobs of canes carried by dandies. Mr. Fitzgerald mentioned, as a unique fact, that Lady W. Wynn's house in St. James's Square was not only built by Adam but was decorated by him, and furnished, even to the humble cruet-stand, on his designs.

Westminster Cathedral.—We are officially informed that there is no prospect of the cathedral being opened this year.

Keystones.

A Stained-Glass Window has been placed in St. Paul's Church, Canterbury, to the memory of Sergeant Harold Arthur Gilham.

The Wesleyan Methodist Church at Dorchester is to be enlarged by the addition of a chancel and side galleries at a cost of £3,000.

A New Electricity Station at Nelson has been erected by the Nelson Corporation at a cost of £30,000 from designs and under the superintendence of Mr. Fraser, the borough electrical engineer.

Baptist Church and School, Wellingborough.—The designs submitted by Messrs. George Baines, F.R.I.B.A., & R. Palmer Baines, 5, Clement's Inn, Strand, W.C., have been accepted for these buildings. The accommodation provided in church is for 601 adults. The estimated cost of the complete scheme, including tower, is £4,923.

A New Wesleyan Church at Branksome has been erected at a cost of about £1,600. It is intended to build a school at the rear, at a further outlay of £400. The original designs for the building were provided by Mr. C. Bollam, architect, of London, but they have been altered and amended from time to time as circumstances required. The building provides seating accommodation for 450 persons. It is Gothic in style and is built of local red bricks with white stone dressings. Mr. E. H. Crabb is the contractor.

Hornsea Parish Church, which during the past few years has been enriched by the addition of several costly gifts, was reopened recently after a short interval, during which a chancel screen and several other additions were made to its internal fittings. The screen is so arranged that while the bottom part is open so as not to spoil the view of the east end, the upper part is exceedingly rich in carving. It has been erected from designs by Messrs. Brodrick, Lowther & Co., of Hull and Hornsea, and the work has been carried out by Messrs. W. K. Barr & Sons, of Hornsea.

A New Hotel at South Shields has been erected at the corner of Chichester Road and Stevenson Street. The first storey is of brown and green faience work, supplied by the Burmantofts Fireclay Co. of Leeds, the upper parts being of red bricks, with tiled roof, while the corner is surmounted by an ornamental dome. Messrs. M. Hall & Son, of South Shields, were the architects, and Messrs. R. Summerbell & Son, of Tyne Dock, the contractors. The other contractors were Messrs. Wylie Brothers, for tiling, &c.; W. Allon, painting and decorative work; Fowler & Brock, upholstering and furnishing; and J. Douglas, plumbing and electric lighting.

The Soane Museum, in Lincoln's Inn Fields, is now open to the public for the season. Among the art treasures of the museum are the alabaster sarcophagus of Seti I, who ruled Upper and Lower Egypt about 1380 B.C., and several paintings by Turner. The collection is rich in works by Hogarth. It is open on the Mondays, Tuesdays, Wednesdays, Thursdays and Fridays of every week from March to August. Nothing had been altered since 1837, when Sir John Soane died, and the only modern addition is the electric light. Only one article has been added to the museum since Soane's death, and that is a bracelet left by a lady. At first the trustees declined to receive it, but the judges decided otherwise. The jewel was worth about £2 10s., and the law costs amounted to £92.

Truro Cathedral.—A correspondent of a local paper says: "When my lifelong friend, Mr. Henry Cane, was for some time clerk of works over Truro Cathedral he prophesied darkly the all too early fate of the building. He roundly asserted the late Mr. Pearson had altogether miscalculated the weight and strain which the stone used in the construction would carry, and stated his belief that in less than fifty years the whole edifice would suddenly fall down. Mr. Cane was one of the most trusty of the late Sir G. Gilbert Scott's clerks of works, and under him superintended the erection of some of the most important buildings in the kingdom. He was also for a number of years the resident clerk of works of York Cathedral. He is now resident at North Yamhill, Oregon, U.S.A."

The British Association.—The Council of the British Association have nominated Sir Norman Lockyer, K.C.B., F.R.S., as president at the meeting to be held in Southport in 1903.

Builders' Journals Wanted.—The publisher will be glad to send a copy of the current issue of THE ARCHITECTURAL REVIEW in exchange for a copy of THE BUILDERS' JOURNAL for August 28th, 1901, which is out of print.

Additions to the Victoria Institute at Worcester are to be made. A competition is to be held, confined to local architects and to three students at the Institute—Messrs. A. G. Parker, H. J. Pitcher and W. J. M. Thomason.

The Furniture for "The Princess's Nose," Mr. Henry Arthur Jones's new play produced at the Duke of York's Theatre last week, has been supplied by Messrs. Oetzmann & Co., of Hampstead Road, W.

A Memorial Fountain to Prof. Henry Drummond, designed by Mr. Pittendrigh MacGillivray, has been erected in Glasgow. It is in bronze and forms part of the central pillar of the Park Gate entrance to Kelvingrove Park. The main feature is a medallion portrait of the Professor modelled in low relief.

National Photographic Record Association.—The object of this Association is to collect photographs of any object of interest to the architect or archaeologist, literary or scientific man. The photographs are placed in the Print Room of the British Museum. Whole-plates are preferred, but half-plates, or even quarter-plates, are acceptable. Prints must be by some permanent process, such as platinotype or carbon: bromides and print-outs are not desired. About 2,500 photographs are at present in the collection. The hon. secretary of the Association is Mr. G. Scamell, F.R.I.B.A., F.G.S., "Gayton," Avenue Road, Highgate, N.

A New Church Extension Hall and Classrooms is being erected at Brighton Avenue, Gateshead. The scheme comprises a church to seat about 700, with hall to seat 500, ample classroom accommodation, and caretaker's house. Messrs. Badenoch & Bruce, Newcastle, are the architects for the work, and the contractor for the hall and classrooms is Mr. John Anderson, of Newcastle. The style adopted is late Gothic. The walls will be in stone, with hammer-dressed facing and chiselled dressings. The total cost, including the site, is estimated at £8,000. The present contract, which includes hall, caretaker's house, and classroom, will cost about £2,800, exclusive of site.

The New Central Offices at Bisley of the National Rifle Association are now in course of erection. The new building will afford accommodation for all. Large apartments will be provided for the accountants and range officers. The first floor will provide for the statisticians, linotype and oil-engine, with concrete floor. The telegraphists will have rooms on this floor also, and all the rooms will be connected by small lifts with the downstairs apartments. Upstairs there will also be a telephone-room and committee-room, and above the building will be erected a tower with a look-out and a camera obscura. The materials used will be red bricks and tiles. The cost will be £4,500. Mr. Alfred Burr, F.R.I.B.A., is the architect. "Uralite," a substance made of asbestos fibre, will be used in the construction of the building for the sake of coolness.

An Ilkley Competition.—A competition was recently held for designs for a New Baptist church and schools at Ilkley proposed to be erected on a site on the east side of Devon Crescent, off the Grove. Forty-two sets of designs were submitted and last Thursday, on the recommendation of their professional adviser, the Committee unanimously accepted the designs marked "A," the authors of which were Messrs. Garside & Pennington, architects, of Pontefract and Castleford. The designs provide for a church to seat 500, erected in free Gothic treatment in stone, with tower and spire, with red tiles, also a large schoolroom to seat 300, suites of classrooms, &c., conveniences, and caretaker's cottage. The total cost is estimated at £8,000. Messrs. Garside and Pennington have since received instructions to proceed with the work at once. Messrs. G. F. Danby and E. M. Simpson, of Park Row, Leeds, took second place.

Mountain Ash Municipal Buildings Competition.—Mr. J. H. Phillips, of Cardiff, whose design was placed first by the assessor Mr. G. Halliday, F.R.I.B.A., has been instructed to proceed with the work.

Hutton-Buscel Church, near Scarborough, was struck by lightning recently. The tower was wrecked, and over half a ton of debris fell with a great crash on to the roof of the main structure below. Fortunately nobody was hurt.

Sheffield Queen Victoria Memorial.—At a meeting of the Sheffield City Council held last week an amendment to refer back the question of the site of the Queen Victoria memorial was lost. The selected site of the Monolith is considered by local architects to be wholly unsuitable.

New Patents.

These patents are open to opposition until April 19th.

1900.—Ventilating and Flushing Drains.—20,219. I. SHONE and E. AULT, both of 47, Victoria Street, Westminster, S.W. The sewage is discharged into a tank or "flushing ejector," which, when filled, may be syphonically discharged by the flush from a water-closet, the discharge being very powerful. Air is drawn in and the ventilation of the drains thus effected. A safety valve is also provided which opens when a predetermined pressure is created in the system, and this prevents the traps being forced.

1901.—Saw-Sets.—4,912. J. MITCHELL, Packington Hill, Kegworth, Leics. The device consists of a small metal frame having a setting-plate with four bevelled edges at different angles, to suit different teeth. The tooth-setter has a spring attachment and is adjusted by a thumb-screw. The whole device is very small and neat.

Water-Supply Valves for Closets.—6,312. H. L. DOULTON, Lambeth Sanitary Engineering Works, Lambeth, S.E. This valve is primarily intended to work with a closet having two traps and emptied by syphonic action, the object being to give an after-flush. For this purpose two pistons are employed, one entering the valve and partially arresting the discharge before the valve is finally closed by the second piston.

The following specifications were published on Thursday last, and are open to opposition until April 26th. The names in italics are those of the communicators of the inventions. A summary of the more important of them will be given next week.

1901.—3,349, SHAW, measuring instruments. 3,425, WILKINSON, stop-tap boxes. 3,966, HARGREAVES & HARGREAVES, guards for machinery. 4,052, STOBES, means for testing shot-firing cables in quarries. 4,865, BOULT (*Chisholm & Moore Manufacturing Co.*), cranes and hoisting apparatus. 5,587, GREENE, file and rasp cutting-machines. 5,617, FELL, pipe joint. 5,949, JEFFREY, valves, taps, &c. 6,031, STEAD & STEAD, chimney pots. 6,495, SMITH, machines for corrugating sheet metal. 7,016, JANDUS ARC LAMP & ELECTRIC CO., LTD., & JONES, electric arc lamps. 7,274, DOBBS BROTHERS, LTD., DOBBS & STONE, fixing terminals on stair and other rods. 7,594, OATES, tap for lavatory basins. 7,705, ALLISON, screw-jacks. 8,160, ACKROYD, ACKROYD & GILL, chimney pots, ventilators, &c. 9,369, LAKE (*Fallner & Ziegler*), rotary kilns. 9,471, RYAN, pipe joints. 14,635, BOULT (*Marsden*), machines for making bricks, briquettes, &c. 18,758, HOCHSTEIN, expansion joints for pipes. 19,525, WITTKOWSKY, split wood pulleys. 19,609, MAHER & BARNER, machines for grinding, smoothing and polishing glass. 22,702, RAE, saws. 22,713, ELLIS, paving blocks. 24,140, SCHECK, beams, columns, &c. 24,513, HARDEMAN, windows. 25,523, RUDIGER, sliding handle for staircases. 25,667, HADDAN (*Wayss & Freytag Aktiengesellschaft*), concrete floors and ceilings. 25,802, THOMPSON (*Perfect Sliding Door Co.*), sliding doors and windows. 26,063, BOULT (*Wilhelm & Guth*), glue pots. 26,529, SCHAEFER, soldering too's.

1902.—383, BROOKE & GLOSSOP, artificial stone.

Engineering Notes.

Electric Light in Stepney Parish Church is proposed to be installed instead of gas. The church is now being rebuilt, after the fire which occurred in October last.

The New Tramp Wards, Abbeydore, have been fitted with an improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

Boiler Explosions.—The nineteenth annual report on boiler explosions issued by the Board of Trade states that during 1900-01 thirty-three persons were killed and sixty persons injured; the average numbers for the last nineteen years being twenty-nine and sixty-one respectively. As in previous years, the explosions were chiefly due to the deterioration or corrosion of the plates, &c., or to defects in the design, workmanship, material or construction.

Electric Tramways at Richmond.—The Richmond Town Council has sanctioned the introduction of the London United Co.'s tramways into the town from Hammersmith, via Barnes, on condition that the company pays an annual way-leave of £1,250, widens the streets to a minimum of 33ft., uses the overhead system in Mortlake Road only, and not Kew Road, and promotes no further extensions in the borough without leave of the Council.

The Purification of Air.—Colonel Ergledeue, late of the Royal Engineers, writing on the question of the purification of the atmosphere of the Houses of Parliament, suggests the use of ozone, which can now be produced from atmospheric air, free from nitrogenous products, at a most moderate cost, where an alternating current of electricity is available or can be provided. This also applies to the sterilisation of air in every description of public or private buildings.

New Mond Gas Works.—The Midland Electric Corporation for Power Distribution, Ltd., some time ago selected Tipton as the most suitable location for their enterprise, and now the South Staffordshire Mond Gas (Power and Heating) Co. have followed suit. The site for the Mond gasworks consists of thirty-two acres at Dudley Port, with an additional acreage of mines, which will ensure lateral support to the buildings to be erected. The site, which is freehold landed and mining property, is known as the "Burton Estate." It is in the centre of the area over which the company has Parliamentary powers, extending to 123 sq. miles. Plans are now being prepared for the erection of the works by the consulting engineer of the company, Mr. H. A. Humphrey (Westminster).

Acetylene Generators.—The report of the Committee on Acetylene Generators has been issued. Forty-six generators were tested. In every case a representative of the firm which submitted the apparatus was present, so as to ensure that the generator was worked under the most favourable conditions. The members of the Committee state that, while the generators in no instance showed evidence of being otherwise than safe under the conditions of the test to which they were subjected, many were in the opinion of the committee of a design unnecessarily and undesirably complicated, and some were not sufficiently strong in construction. Having regard to the conditions of use which must often prevail, the Committee considers that in the selection of an acetylene generator regard should be had to the following desiderata:—(1) Simplicity of action and design; (2) strength of construction; (3) high efficiency, as indicated by the yield of gas per lb. of carbide; (4) low pressure in generator; and (5) facility of removal of the residue.

Masters and Men.

A Strike of Carpenters at Dartford occurred last week. Some thousands of men engaged in the construction of the small-pox hospital extensions of the Metropolitan Asylums Board came out. The carpenters demanded the payment of 1s. an hour instead of 11d., the rate hitherto paid for the work. At Gore Farm the men were satisfied with an increase to 11½d., but the men at Joyce Green to the number of 1,500 have ceased work for some days.

Trade and Craft.

Fire-Escape Staircases.

In 1900 the St. Pancras Ironwork Co., Ltd., erected two fire-escape staircases on the south or Piccadilly side of Hyde Park Court, W., that huge residential block facing Sloane Street. These gave such satisfaction that in the autumn of last year the firm received an order to erect two more on the north or park side of the building; and they have been already finished

FIRE-ESCAPE STAIRCASES, HYDE PARK COURT, W.

a month earlier than the contract time. Each staircase is in sixteen flights and is more than 100ft. high.

Greenhouses and Conservatories.

Messrs. W. Richardson & Co., horticultural and heating engineers, of Darlington, send us a copy of their new catalogue. We are glad to see that the majority of the illustrations are from photographs of actual work executed, and also that a number of sectional diagrams are included, showing clearly and simply the interior arrangements of the winter gardens, conservatories and greenhouses and the systems of construction adopted. It is intended that clients shall choose from these illustrations such as most closely conform to their requirements, and the firm will then prepare a special plan to fit, scale, with elevations and sections, to be submitted with the specification and estimate: an arrangement by which clients have the benefit of current prices based on the raw material bought in the cheapest markets: bricklayers' work or masonry, however, is not undertaken.

Messrs. Richardson have at their works a great variety of high-class machinery, besides which there is a siding from the main line of the North-Eastern Railway into their yard, thus effecting a great saving in cartage and labour. Special attention is paid to the quality, suitability and seasoning of the timber used, and the glass is selected to be as free as possible from "burning spot," the panes for the roofs being as a rule cut with elliptical-shaped ends so as to run the rainwater down the centre. The firm do not favour glazing without putty, but they have for many years made an improved form of glazing bar, which prevents the possibility of the putty cracking or peeling off. For stove and orchid houses, &c., a channel is formed at each side of all the bars and rafters, for conveying the condensed moisture into the outside gutters and so preventing it dripping upon the plants. A patent system of ventilation is adopted, 9in. openings being formed in the roof, the full length from ridge to eaves, and at distances of 5ft. centre to centre, the openings being fitted with ventilating frames. Bottom ventilation is obtained by wood "panels" the full length of the sides, and about 8in. deep, hung at the upper edges with brass hinges. Messrs. Richardson have executed a large amount of work for the nobility.

Surveying and Sanitary Notes.

The Southern Approach to Tower Bridge has just been completed. The new thoroughfare has been cut through a portion of Bermondsey by the London County Council at an estimated nett cost of £394,000. The scheme included the widening of Bermondsey New Road, by which the new street is connected with a great centre of traffic at Bricklayers' Arms, Old Kent Road, and the improvement will greatly facilitate the communication between the north and south of London. The new thoroughfare is 3,600ft. long and 60ft. wide, and about 150 properties have been acquired to make it. It was decided by the Council in 1892 to call it Tower Bridge Road, so far as the portion between Tooley Street and Grange Road is concerned, but whether the remaining portion, consisting of the widened Bermondsey New Road, shall have the same name applied to it is under consideration.

Kendal Sewerage.—Messrs. Beesley, Son & Nicholls, the engineers, in the report to the Kendal Town Council, state that most of the sewers in the borough are running nearly full bore, and this by reason of the defective joints. To remedy this there are three courses open:—(a) To lay out an entirely new system of sewers for the sewage proper, leaving the present sewers to act as subsoil and storm-water drains with new outlets to the river Kent. (b) To lay out an entirely new system of sewers for the sewage proper, and construct a new system of surface drainage at a higher level, with outlets into the river Kent. (c) To remedy the defective joints on the existing sewers, and construct a new system of surface drains at a higher level discharging at different points into the river Kent. They recommended method (c). The cost would be about £12,500. In respect to the sewage-disposal, they recommend the bacterial treatment of the sewage on the present outfall site. They estimate the cost of the sewage-disposal works at the sum of £21,525, as follows:—Septic or anaerobic tanks, £5,250; double contact beds, including storm bed, £14,800; laying-out land, £450; contingencies, 5 per cent., £1,025. Total estimate—Sewerage, remedying existing sewers, £12,500; new surface drainage works and storm overflows, £1,850; total, £14,350; sewage-disposal works, £21,525; total amount of estimate, £35,875.

"Light and Heat."—The first number of this new monthly magazine has just been published. It is a review of the gas, electrical and acetylene engineering industries, and is published at 5, St. Margaret's Offices, Victoria Street, S.W., price 3d.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

BIRMINGHAM.—For rebuilding Waterworks Tavern, Birmingham, for Messrs. Truman, Hanbury, Buxton, & Co., Ltd., Mr. Charles Hook Collett, architect. Quantities by Mr. Henry Clover:—
Whitehouse & Sons ... £3,350 | Turton ... £3,143
Moorhouse ... 3,204 | H. Gibbs ... 2,921
Gowing & Ingram ... 3,175 | Morris ... 2,849
Lee & Son ... 3,160 | * Accepted.

BOGNOR (SUSSEX).—For the construction of a concrete tank sewer, 4 ft. in diameter and 1,050 ft. in length; also for the relaying of a 16-in. stoneware pipe sewer, and the laying of other 12-in. and 9-in. pipe sewers, for the Bognor Urban District Council. Mr. W. L. Barrett, engineer:—

With patent jointed pipes.	
E. H. King, Worthing ...	£7,300
J. Jackson, Plaitow ...	6,093
G. Osenton, Westham ...	6,500
E. H. King† ...	6,500
Tate Bros., Bognor ...	5,869
Grounds & Newton, * Bourne-mouth ...	5,083
With ordinary pipes.	
E. H. King ...	6,000
J. Jackson ...	6,205
G. Osenton ...	6,200
E. H. King† ...	6,180
Tate Bros. ...	5,244
Grounds & Newton ...	5,082
* Accepted. † Alternate.	

BUNCRANA.—For the erection of two houses, Cockhill Road, for Mr. P. Porter. Mr. J. P. McGrath, architect, 28 Carlisle Road, Londonderry:—

H. Campbell, Bunrana ...	£600
R. Colhoun, Londonderry ...	420

GATESHEAD.—For a length of about 600 yards of 18-in. fireclay pipes for the drainage of Saltwell Cemetery, for the Gateshead Corporation. Mr. J. Bower, borough engineer:—

D. Young, Elm Grove, Hexham ...	£3,323
J. Robson, Tankerville Place, Newcastle ...	3,292
G. Bell, 29, Corporation Street, Manchester ...	2,535
I. Bewley, Dunston ...	2,405
Brebnor & Co., 44 St. Andrew's Square, Edinburgh ...	2,315
J. Thompson, 19 Windsor Terrace, Gosforth, Newcastle ...	2,114
* Accepted.	

HALESOWEN.—For the kerbing, channelling, making, and draining of the following streets in Cuckmere, Blackheath, for the Halesowen Rural District Council: Green Lane, about 380 yards in length; Station Lane, about 310 yards in length; part of Master's Lane, about 80 yards in length. Mr. William Whitworth, Public Offices, Great Cornhill, Halesowen, surveyor:—
J. Mackay, Smeethwick, near Birmingham ... £2,187
Wheeler & Thompson, Old Hill, Staffs. ... 2,005
W. H. Jones, Great Tindal Street, Birmingham ... 2,030
J. A. Meredith ... 1,902
Curral, Lewis & Martin ... 1,929
Barnes & Co., Northfield, near Birmingham ... 1,892
W. Willetts ... 1,751
A. Cooper ... 1,708
T. Crumpton, * Hawne, Halesowen ... 1,445
* Accepted.

HEREFORD.—For rebuilding St. James's Church, Hereford, after fire. Messrs. Nicholson & Hartree, architects, Hereford:—
Smith, Kidderminster ... £5,707
King & Son, Gloucester ... 5,083
Hatch ... 5,400
R. Morgan, Kingston ... 5,270
Broad, Malvern ... 5,207
W. P. Lewis & Co., Hereford ... 4,875
W. Bowers & Co., Hereford ... 4,830
Beavan & Hodges, Hereford ... 4,682
C. Cooke, * Hereford ... 4,400
* Accepted after some variations and omissions. Arranged at £3,835 10s.

ILKLEY.—For the masonry and other works required to be done in the erection of the Cowpasture Bridge over Backstone Beck, for the Ilkley Urban District Council:—

Kell Bros., Leeds ...	£2,564 0 0
J. Brown ...	2,047 15 0
J. Forrest ...	1,990 0 0
E. Kellett, Bradford ...	1,988 0 0
J. Murdock ...	1,941 15 5
W. Barrand, Bradford ...	1,894 18 0
Horne & Maud, Horsforth ...	1,825 0 0
T. Egan & Sons, Bradford ...	1,812 18 10
Dean Bros. ...	1,607 1 9
* Accepted. [Rest of Ilkley.]	

JARROW.—For alterations and additions at the Higher Grade School, for the Hedworth, Monkton, and Jarrow U.D. School Board:—

S. Craig, 283 High Street, Jarrow ...	£1,336 8 8
J. A. Henderson, Park Road, Hedburn ...	1,270 19 0
J. Barrow, * 24 Croft Terrace, Jarrow ...	1,018 9 6
* Accepted.	

LEEK (STAFFS).—For the erection of a poultry market, for the Leek Urban District Council. Mr. John Myatt, town surveyor:—

T. Grace ...	£1,124 0
S. Salt ...	1,090 0
H. P. Embrey & Co., Fenton ...	1,067 17
J. Heath ...	1,055 15
Heath & Lowe ...	940 0
* Accepted. [Rest of Leek.]	

LONDON, W.C.—For rebuilding corner block in Strand comprising Carr's Restaurant. Mr. Walter Emden, M.S.A., architect:—

W. J. Bloxham ...	£20,800	Holloway Bros. ...	£25,779
F. & H. F. Higgins ...	27,500	Patman & Fotheringham ...	25,407
Spencer, Santo & Co. ...	27,225	Bateman ...	25,447
Martin, Wells & Co. ...	27,008	Kirk & Randall ...	25,447
T. L. Green ...	26,790	W. Sharnum ...	25,365
W. Greger & Son ...	25,723	Holliday & Greenwood ...	21,877
Downs ...	25,773	* Accepted.	
Hall, Beddall & Co. ...	25,838		

LONDON.—For enlargement of Mowlem Street School, for the London School Board:—
McCormack & Sons ... £3,308
Grover & Son ... 3,256
Leslie & Co., Ltd. ... 3,151
T. L. Green ... 3,147
W. Greger & Son ... 3,125
Clarke & Bracey ... 3,115
Snevin Bros. & Co. ... 3,080
Staines & Son ... 3,026
Treasure & Son ... 3,041
* Recommended for acceptance.

LONDONDERRY.—Accepted for alterations and forming business premises at Carlisle Road. Mr. J. P. McGrath, architect, 28 Carlisle Road, Londonderry:—
W. J. Boyd, Londonderry.

LONDONDERRY.—Accepted for the erection of residence at Lawrence Street (Foyle College Grounds) for Mr. W. N. McGuinness. Mr. J. P. McGrath, architect, 28 Carlisle Road, Londonderry:—
A. Dunlop, Rackville Street ... £280
[Amended tender, omitting painting and plumbing work.]

LONDONDERRY.—Accepted for the erection of three cottages at Lecky Road for Miss Gallagher. Mr. J. P. McGrath, architect, 28 Carlisle Road, Londonderry:—
J. Gallagher & Sons, Moville ... £275

PEAR TREE GREEN (HANTS).—For the erection of a new boys' school, High Street, Pear Tree Green, for the St. Mary Extra, Sholing, and Hound (U.D.) School Board. Messrs. W. H. Mitchell, Son, and Gutteridge, architects, 9 Portland Street, Southampton:—
Hinton Bros. Woolston ... £6,500
Witt Bros., Bitterne ... 6,475
H. Cawte, Shirley ... 6,178
T. Rashley, Southampton ... 6,083
Jenkins & Sons, Ltd., Above Bar, Southampton ... 5,985
Stevens & Co., * Northam, Southampton ... 5,880
* Accepted subject to the approval of the Educational Department.

PONTYPRIDD.—For the erection of an isolation hospital at Llantwit Fardre, near Pontypridd, for the Pontypridd Urban District Council. Mr. E. Rees, surveyor:—
W. Thomas & Co., Cardiff ... £8,094 16 0
Williams & James, Pontypridd ... 7,118 0 0
Morris & Thomas, Pontypridd ... 6,983 5 0
G. Rutter, Barry ... 6,902 14 0
W. E. Willis, Ystrad Rhondda ... 6,772 8 4
Price Bros., Cardiff ... 6,667 0 0
W. Davies, * Pontypridd ... 6,397 0 0
* Accepted.

WATFORD.—For the erection of nurses' homes, for the Guardians. Mr. C. P. Ayres, architect:—
Waterman ... £2,250
W. King ... 2,236
C. Eames ... 2,103
Toms ... 2,117
C. W. D. Reed ... 2,100
H. Martin, Northampton ... 2,035
B. Dewdney ... 2,050
Clark Bros. ... £2,020
H. B. Watkins ... 1,940
Tyler & White ... 1,980
G. Wiggins ... 1,910
Clifford & Gough, * Watford ... 1,867
C. Brightman ... 1,707
* Accepted.

WEALDSTONE (HARROW).—For the erection of a shop at Wealdstone. Messrs. Clarke & Charles, architects, the Harrow Estate Offices, Peterborough Road, Harrow. No quantities supplied:—
C. Simmons, Harlesden ... £750
J. & J. Bailey, Wealdstone ... 650
M. Dymock, Wealdstone ... 650

New Companies.

A. & J. Webster, Ltd.

Registered to acquire and carry on the existing business of builders, joiners, architects, timber merchants and sawmillers. Capital £5,000 in £5 shares.

Rolls & Linoms, Ltd.

Registered to carry on the businesses of manufacturers and sellers of varnishes, paints, colours, oils, brushes, &c. Capital £10,000 in £1 shares.

George Pollard & Co., Ltd.

Registered to acquire the business of English and foreign timber merchants, sawmill proprietors, building and general contractors, builders' merchants, owners of planing, turning, and moulding mills, marble, stone and slate merchants as now carried on at Wood Street, Taunton. Capital £5,000 in £1 shares. The directors are G. H. and H. S. Pollard. Registered office: Wood Street, E.C.

Standard Construction Corporation, Ltd.

Registered to construct, erect, maintain, execute, carry out, equip, improve, work, develop, administer, manage, and control works and conveniences of all kinds, including railways, tramways, docks, harbours, piers, canals, reservoirs, embankments, irrigations, reclamations, sewerage, drainage, sanitary, water, gas, electric light, telephonic, telegraphic, and power supply works, &c. Capital £150,000 in £1 shares. Registered office: Amberley House, Norfolk Street, Strand, W.C.

Henry Heys & Co., Ltd.

Registered to acquire the business of stone merchants, quarries, colliery owners, brick-makers, &c., as now and hitherto carried on at Stacksteads and elsewhere in Lancashire as H. Heys & Co., and to carry on the business of stone and marble merchants, stonemasons, quarrymen, colliery owners, brickmakers, dealers in clay, sand, loam, earth, timber, hardware and other building requisites, pipe, tile and terra-cotta makers, potters, &c. Capital £60,000 in £1 shares. The directors are J. Heys, W. Heys, and H. H. Ratcliffe. Registered office: Blackwood, Stacksteads, Lancashire.

Ballymena Brick and Tile Co., Ltd.

Registered for the purpose of acquiring about 60 acres of land at Ballylesson, near Ballymena, County Antrim, the property of Mr. Andrew McQuiston, and to continue and carry on the factory for making bricks and earthenware goods. Capital £10,000 in ordinary shares of £1 each and £5,000 5 per cent. first mortgage debentures. The directors are Sir George Pigott, Bart., Warfield Grove, Bracknell, Berkshire; John F. Sargeant, Bracknell; Andrew McQuiston, Bracknell; and John Campbell, Ballymena.

THE DREAD DISEASE

of Small-pox still retains its hold on London, despite all the efforts which have been made to stamp it out. Every reader in the Metropolis should

INSURE AGAINST IT

by adopting our Insurance Policy No. 3.

These are the three Schemes:—

(1) *A Free Accident Insurance of £500 to every regular reader of our paper.*

(2) *An Accident Insurance of £500, and also £250 for Permanent Total Disablement. £2 10s. per week for Temporary Total Disablement.*

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

(3) *An Accident Insurance of £1,000, with the following special additional advantages: £500 for Permanent Total Disablement. £6 per week for Temporary Total Disablement. £1 10s. per week for Temporary Partial Disablement. £30 Annuity.*

£3 per week during confinement from such illnesses as Small-Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c.

Ordinary Risks, Premium, £3/-
Hazardous Risks, Premium, £3/10/-

Write for Proposal Form.

These Insurances are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

SPECIAL NOTICE.

(1.) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.

(2.) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.

(4.) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is only necessary to write a postcard, giving the full name and address of the newsagent from whom the copy is obtained.

A Pamphlet, giving full details of the THREE SCHEMES will be sent on application to

THE MANAGER, BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

COMPLETE LIST OF CONTRACTS OPEN.

Royal Academy Exhibition, 1902.

The receiving day for architectural works is
Thursday, March 27th. We shall be pleased, as
in previous years, to receive drawings from
intending exhibitors and to forward them (free
of expense) to Burlington House. No drawings,
however, can be received by us later than noon
to-morrow.

An Architectural Causerie.

The Stuffy House. QUITE recently the methods adopted for ventilating the House of Commons have again been the subject of discussion. One thing is certain—the atmosphere of the House, however free it may be from dust, smoke and other impurities, is oppressively dead; and just as “Dr. Ox’s Experiment” so exhilarated people that they verged on madness, so, in inverse ratio, the depressing, still, torpid air of St. Stephen’s reduces members to a state of lethargy. Considerable temporary improvement would be effected if, during the dinner half-hour—and even during some divisions—the windows of the House were thrown open and the fresh air allowed to sweep in, smoke-laden, fog-laden and acid-laden though it be: those who have the benefit of living in it certainly find it healthy, and doubtless our honoured legislators would be similarly benefited by their Gothic box being refreshed by a good breeze once in a while.

A Suggestion to the Scientists. ALL the world knows by this time of the new Physical Laboratory in Bushey Park which the Prince of Wales opened last week. There the physicists, freed from vibrations and the influences of iron and electricity, may work out the great problems which confront them, taking measurements of pieces of metal accurate to the millionth of an inch and of temperature to hundred-thousandths of a degree. Might not the work be extended in scope so as to include architecture? For hundreds of years architecture as Art has been periodically set forth by the prophets, but the questions of “style” are equally harassing to-day, and while some regard the Italian Renaissance as the apotheosis of architecture others prefer a modern factory or an engineering workshop. These prophets have failed to prove conclusively that architecture is an art: why, therefore, should the scientists not attempt to prove that it is Science?—of course embodying their laws in such phraseology that nobody can understand exactly what is meant. The idea is naturally not a new one, for in a modified way we find it among the Greeks, though its com-

plete adoption does not occur till the Georgian period, when Palladio took the place of a manufacturer’s catalogue, being afterwards discarded in favour of the Gothic copy-book with its faultless repertory. But our scientists could go farther than these. They might establish beyond dispute what diameter a column of a certain height must be, whether of the elongated or the rainwater-barrel type; what constitutes originality, and, if there is no such thing, how it can be obtained; whether or not architecture is frozen music, and, if so, whether ornament may be notated, and buttresses made subject to the laws of counterpoint, and, by consequence, whether the architectural curriculum in our schools should include a course on the harp, violin, cornet, banjo or other instrument; to determine—if need be to ten places of decimals—whether architectural assistants do really assist, and, if so, whether they are greater, abler and more intelligent in every respect than their principals; to determine why committee-men know more about architecture than the assessors engaged by them; to determine why a photograph of a building is false, and, if not, why an exhibition perspective is——all these vitally

buildings struck by lightning; the intention being to test the results accruing from the rules laid down by the Lightning-Rod Conference twenty years ago. The first-named committee has succeeded in enlisting the services of more than 200 observers in the United Kingdom, including the War Office, the Home Office, the Post Office and the Trinity House Corporation, similar observation being also available in foreign countries. So far, about seventy trustworthy records have been collected, these including photographs, which are of the greatest interest and importance. Up to the end of last year sixty cases had been tabulated, and of these no fewer than twelve concerned buildings which were furnished with some kind of lightning conductor, which is ample proof that the presence of such a “protection” does not necessarily prevent a catastrophe. Sufficient data has not yet been obtained to test the efficacy of the system recommended by the Lightning-Rod Conference, but evidence tends to show that this system is not altogether satisfactory, and if the Committee by thus scientifically collecting trustworthy reports and drawing practical conclusions from them can determine what are the essentials in

important problems await solution, and who more qualified to undertake the work than the scientists? Euclid being a science, and assuming architecture to be one also, might not a new system of building construction be formulated which would do away with the present text-books and replace them by a Government work based on the problems of Euclid? For example—*theorem*, to construct a town hall on a given crooked site; or—*theorem*, to design a library without resort to copying; or again—*theorem*, to build a house without extras. Complete solutions to these problems would be of inestimable service: yet hitherto the scientists have rigidly evaded them: now is their chance.

House, Barnt Green. THE house at Barnt Green, near the Lickey Hills, in Worcestershire, will be constructed of small Leicester sand bricks with half-timber, white stucco and plaster in the gables. Broseley tiles will be used on the roof. The total cost is estimated at about £2,000.

Lightning Research Committee. ABOUT a year ago the committee known as the Lightning Research Committee was formed by the Councils of the Royal Institute of British Architects and the Surveyors’ Institution, with the object of collecting and tabulating information in regard to

any system of lightning protection, they will be rendering a very great service to the community, and particularly to architects, builders and house-owners.

Houses for Fifty Years. IN the course of the paper which he read last Friday before the Architectural Association Mr. Lever contended that while the industries had all discarded old methods in favour of new, architecture had failed to keep up with the times; with the result that, so far as the housing question was concerned, it was found impossible to build houses which could be let at a rental sufficiently low to be within the means of the labouring classes: and his special contention was that modern needs demanded such houses to be built to last, not hundreds, but tens of years. This is a question which cannot be disposed of in a few words, but there is certainly much truth in Mr. Lever’s proposal. It is well enough with Sir Christopher Wren to talk of building for eternity; and because architects have always had this idea before them they have neglected to attack the problem of cheap houses, leaving the work to the jerry-builder. There is undoubtedly a large field for experiment here, and we commend the matter to those architects who are able to show an equal perception of the needs of the present day as their fellow-workers the naval architects have shown in shipbuilding.

NO. 39, CHEYNE WALK, CHELSEA, LONDON: STUDY. C. R. ASHBEЕ, ARCHITECT.

THE CHURCH OF THE SACRED HEART, PARIS.

THREE great monuments stand out prominently as records of the modern history of France: the first is the Madeleine, the memorial church to the victims of the Revolution; the second, the Arc de l'Etoile, the vast triumphal arch of the Napoleonic era; the third, the great church of the Sacre Cœur, raised in memory of the victims of the Commune, and now virtually complete on the heights of Montmartre. It is placed on a lofty hill dominating all Paris; a steep climb awaits the visitor; from the summit of the hill he looks down over the vast expanse of the city and notes with sorrow its rapid spoiling by volumes of smoke from countless tall chimneys; all around him is the ancient tumbledown village or suburb (it is hard to say which) with brown-tiled roofs and dormer windows, its old church of St. Pierre and its "Calvary." The new church is placed close to the edge of the precipitous height, so close, indeed, that on one side it rises over a retaining wall, the west front being approached by terraces and flights of stone stairs. The most conspicuous object in the view for many miles, its design is simple and its leading features boldly marked. In plan it is very nearly a Greek cross, though the nave is just sufficiently prolonged to say that it is a Latin one. Its great feature is the dome, with four smaller cupolas about it. These are of dazzling white stone, surmounted by small lanterns—if the word may be applied to a ring of tiny columns supporting a very small cupola. A striking peculiarity is that all the domes are covered with white stone scales arranged in bands, resembling the system known as scale slates. Externally the body of the church is very plainly treated; the details are Romanesque and the windows small and round-headed; its appearance is rather that of a mausoleum than an ordinary church, and this, perhaps, was deliberately intended. Internally it bears the same character, simple and even stern; vaulted throughout, with an apsidal east end surrounded by a ring of chapels, each ending in a semi-dome. The building is fairly large and lofty, but cannot be called vast. The drum of the central dome is pierced with a ring of round-headed windows; upon its pendentives are the figures of four angels which seem to adhere to the face of the spandrels and are not visibly supported, a somewhat questionable system of ornament for which precedents may be found in Italy—some of the vast figures in St. Peter's at Rome, for instance, being very insecure in appearance. The interior as a whole is dignified, well proportioned and effective. In the future presumably the internal walls will be largely adorned with mosaic.

Throughout the church one sees frequent evidences of M. Paul Abadie's long study of "the forty churches of Aquitaine" and other Romanesque and traditional buildings of south-western France; all of the period when the Gothic arch was struggling into existence and the Roman slowly passing away.

The site chosen for this new cathedral is one of the most remarkable in Europe, and the building, though severe, is not wanting in that character of striking or dramatic effect which a French architect, if given a free hand, perfectly understands: though it is debatable whether domes of such unusual form—unusual in Europe at least—are the most effective that could have been chosen.

[At the moment of going to press we have received from M. Henri Rauline (the architect under whose direction the cathedral is now being completed) a fine photograph of the interior and two plans. These will be published in our next issue, together with some additional particulars of the building.—ED. B. J.]

NO. 39, CHEYNE WALK, CHELSEA, LONDON: DINING-ROOM. C. R. ASHBEЕ, ARCHITECT.

Correspondence.

Architecture and Cigarettes.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—On opening a packet of cigarettes the other day I found therein a photograph, not of an actress, nor a footballer, nor even a British general or politician, but of a cathedral! We are so ready to lament the signs of the times that when we come across a "saving sign" like this ought we not to publish it far and wide? Such was my first thought. Visions of a cigarette-smoking public taking an intelligent interest in the cathedral architecture of the land flitted before my eyes. I looked at my photograph more closely. It was a view of Chester Cathedral from the south-east in all the newness of the nineteenth-century dress with which Sir Gilbert Scott clothed it. But underneath was the legend: "Chester Cathedral. Built in 1034"—only that and nothing more, and my golden visions melted away. It is there in black and white for thousands of smokers to read, and they will enquire no further, but just rest content to know that Chester Cathedral was "built in 1034"!—Yours truly, F. H. C.

The Ink-Bottle.

To the Editor of THE BUILDERS' JOURNAL.

BIRMINGHAM.

SIR,—The following idea will perhaps be of use to some readers, especially to those familiar with the disastrous consequences of a spilt ink-bottle in the drawing-office:—A plain glazed tile about 3in. square (such as no doubt will be found among the office samples) is taken and cleaned. The ink-bottle is next corked and turned upside down. Its concave bottom is then filled with gum or other adhesive, the tile is laid on it, and the whole reversed right side up. When set the device will be found very serviceable—it may also be used as a paper weight.—Yours truly, H. T. W. G.

Houses in Cheyne Walk.—The fronts of these houses by Mr. C. R. Ashbee, illustrated in our centre plates this week, are of 2in. Bracknell bricks with hard Bath-stone dressings. The balls and domes on the railings are gilt. The sideboard shown on the opposite page is in oak, partly stained and polished. The study has some eighteenth-century panelling taken from an old house formerly on the site.

LEADWORK.

By F. W. TROUP, F.R.I.B.A.

A PAPER on "Leadwork" was read recently by Mr. F. W. Troup, F.R.I.B.A., before the Sheffield Society of Architects and Surveyors. Mr. Troup said:—Few people realise to what extent lead was formerly used in the art of building. The ease with which the metal could be reduced from the ore made its use possible with the rudest of appliances. Once reduced to the metallic state it is one of the most imperishable of the metals. It is at the same time the easiest of them all to melt, to cast or to fashion into various shapes, either in the molten or solid state. We find examples of lead having been used in Babylonia, in Egypt, in Greece, and extensively in Roman times. There are many examples of Roman coffins and cists and ingots in the various museums. In the crypts of St. Paul's Cathedral I have seen Roman water-pipes stacked in heaps of old lead. This is kept to be melted down when required for new sheathing for the dome or other parts of the roof. I do not suppose that in this year of grace, 1902, a Roman water-pipe would be sacrificed in the melting-pot, even of St. Paul's Cathedral, but that was the obvious intent when the pipes were stacked there. Doubtless many have ere now been melted up, and that which once conveyed water to Roman London now conveys the rainwater from the dome to the drains of the cathedral. In mediæval times lead was used for covering the roofs of the finest buildings, also for covering and decorating spires of churches and cathedrals. The London churches particularly were noted for their fine lead-covered spires, chief of them all being that on old St. Paul's. Stow says this was 520ft. high—260ft. stone and 260ft. lead-covered spire. It was burned down in 1561, a century before the great fire of London. Much earlier than this, in 1090, we find (as quoted by Lethaby) the Bishop of Coutances, in Normandy, sending to England for Brisenetus, the plumber, to make afresh the leadwork for the roofs and tower. Numerous though the examples of English leadwork in church and palace were, and still are, I doubt if we have left to us quite such gorgeous examples as are to be found in some of the French roofs, spires and flèches. But I have touched on examples enough to show how much esteemed lead was for practical use in the Middle Ages, and how well the plumbers rose to the occasion, displaying their leadwork so that it held its own with any of the materials used in the greatest of their masterpieces. Yet, with all this, the work was often all done on the site of the building. No elaborate machinery or complicated tools were needed. The plant consisted of a frame about 4ft. or 6ft. wide and 12ft. or more long, on which a sand-bed could be laid. Besides this, little more was wanted except a pot in which to melt the lead. The molten metal was flooded over the levelled bed of sand, and from the sheet so cast everything could be wrought, bossed and beaten up, whether it were a flat sheet for roofing, or a crocket on a spire, or a lead-covered angel on a pinnacle. Various parts were cast in the same sand-bed by imprinting moulds or patterns and running the molten lead into them, but the great mass of the work was beaten up from the flat sheet, and the great art of the plumber consisted in fixing, laying or hanging his lead in such a way as to cover and protect the roof or spire from wet and yet keep his soft and ductile metal from slipping or dragging itself off. If care were taken that the sheet should not tear nor crack by the contraction of the metal at night after being beaten on by a hot summer sun, there was no reason why the material should not last for ever—excepting fire, from which no material is safe that rests on a wooden sub-structure. Gradually the use of lead for anything but the most utilitarian purposes died out, and now "plumber" and "sanitary engineer" are almost convertible terms. The "leadwork" of a building conjures up pipe casings or the grand display of sanitary waste-pipes, overflows and ventilators, culminating in the inevitable cowl that tells of modern sanitation. There is, however, no reason why lead should not be restored to its ancient prestige and be used once more as a material whereon the workman can display his fancy and lavish his labour of love.

SUPPORT FOR ADJOINING BUILDINGS.

By J. F. CARR.

"THERE are some things," said Lord Chancellor Selborne in a well-known judgment, "of which all men ought to be presumed to have knowledge, and among them (I think) is the fact that according to the laws of nature a building cannot stand without vertical or (ordinarily) without lateral support." Certainly all persons engaged in any capacity in building houses must be aware of this simple truth, but perhaps all are not aware of the extent to which one man's house may claim the support of another man's land as a legal right.

It has always been a popular sentiment that a man may do what he likes with his own, but the law imposes an important qualification, namely, that in so doing you must not, except in certain cases, damage another man or his

call it "the servient tenement" as opposed to "the dominant tenement") can prevent this effect arising from the twenty-years' uninterrupted support is by obtaining an acknowledgment in writing during that period from the owner of the building that he uses such support only by permission of his neighbour and is willing on demand to remove the pressure caused by the building. If such acknowledgment cannot be obtained the only course is to remove the support before the twenty years elapse, having first carefully ascertained that the rights are as they appear to be. The removal of the support for this purpose may be an expensive and, in some cases, a practically impossible course to adopt, and this is undoubtedly the reason why this right or, in legal term, this easement is more frequently acquired by enjoyment for the prescribed period than any other.

It must be remembered, however, that the right acquired is only to support as extensive as has been enjoyed for the twenty years. The

SIDEBOARD IN DINING-ROOM, NO. 39, CHEYNE WALK, CHELSEA, LONDON.
C. R. ASHBEER, ARCHITECT.

property. I may, it is true, dig away my land right up to the boundary line to get brick-clay or quarry chalk or slate, or simply for my own amusement; but if I thereby cause my neighbour's house to sink on one side and his walls to gape, serious questions may arise between us in the settlement of which a knowledge of what the law is may prove useful.

The first proposition to be laid down is as follows:—If a man builds a house on the edge of his land he does so at his own risk, and unless he gets his neighbour, expressly or by implication, to agree not to remove the support of the adjacent land he has no remedy if his neighbour chooses to do so.

Secondly, if a building has stood for twenty years, and has stood owing to the support of the adjacent land, the owner of such adjacent land will be taken, whether he likes it or not, to have agreed to allow such support; and if he removes it and damages the house he will have to pay compensation. The most simple way in which the owner of the supporting land (or as lawyers

existence of a greenhouse, for instance for twenty years imposes on the neighbour an obligation to support a building of equal but not of greater weight. In connection with this apparently simple proposition difficult questions have arisen. A building may exercise a certain number of tons pressure for a time, and then owing to internal alterations that pressure may be multiplied by three or four. What weight then will the neighbour's land be obliged to bear?

The instance which caused this question to arise in the law courts and ultimately to require the decision of the highest tribunal of appeal—the House of Lords—was that of a private house which was converted into a coach factory: the internal walls were removed and girders inserted in such a way as to throw much more lateral pressure than before upon the adjoining plot of land. After very elaborate argument and after asking the advice of Her Majesty's judges the House of Lords decided that if the alterations were carried out without any deception or

concealment the right to the support of the increased weight would be acquired after twenty years from the date of the alteration. It is not necessary that the owner of the supporting land should have exact knowledge or, in fact, any knowledge of the increased burden on his land if it appears that the alterations were not made surreptitiously or secretly.

It may be added that, although for the purposes of illustration it has been simpler to state the law as between a building on the one hand and a plot of adjoining land on the other, the same general principles would apply to the case of one building supporting another, though not to the case of one plot of land supporting the adjoining plot of land if the latter is unencumbered by buildings.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Details of Iron Roof.

CAMBERLEY.—PUPIL writes: "The joint at E on the accompanying sketch of a roof-truss taken from my text-book (not reproduced) 'may be made by widening out the tie-rod and driving a hole to allow the king-rod to pass through and then securing it with a couple of nuts. In order to avoid interfering with the tie-rod a clip is frequently formed at the end of the queen-rod. This embraces the former instead of passing through it.' Two other cases in the same book puzzle me. 'In place of the joint at the apex of the truss shown in the figure, a cast-iron head might have been used with an arrangement for tightening up the tension rods. This is usually

DETAILS OF IRON ROOF.

done by forming rectangular slots in the head and ends of the tension rods. When the latter are in position these slots nearly coincide. A steel wedge or cotter is then driven in so as to draw the parts together, the friction being reduced by means of a gib on each side of the wedge. How could this be done? 'In some cases the tie and tension rods in an iron roof are divided in the middle, an arrangement being adopted for tightening them up either by means of cotted joints or screw shackles.' What are 'cotted' joints?"

Apparently the same rod is called both king-rod and queen-rod, but it is really neither, being only a small suspension rod. It has nothing to do but fill in the space to make a symmetrical appearance, as the tie-rod needs no support there. Fig. 1 shows a sketch of the clip joint referred to. It is not usual to put a cast-iron head to a wrought-iron roof-truss, but it might be made as Fig. 2. Gibs are not required with the cotters in a casting. The cotted joint in tie-rod, Fig. 3, requires a gib on the outside to hold the

thin cover-plates together while driving the cotter. Gibs do not reduce the friction but spread it over a larger surface, and for this reason a second gib may if desired be used with each cotter in Fig. 3. The screw shackle referred to is a coupling-box for drawing the two portions of the tie-rod together, as Fig. 4, the threads being right- and left-handed.

HENRY ADAMS.

Architects acting as Quantity Surveyors.

ENQUIRER sends us a very closely-written letter of two sheets and encloses a list of fifteen questions which he desires to be answered. Our columns are not intended to be treated as solicitors' "Requisitions and Replies," and we would again draw attention to our request that all enquiries shall be as brief as possible. These are some of the fifteen questions, as sent: "Can an architect be a surveyor (quantity or measuring)? Ought he to be so? If not, why not? If so, how so? Is he wrong when he measures and makes out a 'bill' from his own plans, &c., to issue to builder? If wrong, how and why?" &c., &c. The rest can be inferred from our reply.

There is not the slightest objection that can be sustained against an architect acting as his own quantity surveyor; in fact, he undoubtedly is the best person to take out the quantities, as he can best read his own plans and knows what he wants. Unfortunately we are compelled to admit that in the majority of cases the architect is not qualified to make out a good bill of quantities that will be a material and accurate aid to the builder in estimating; and unless the architect is fully cognizant of the general and recognized methods of giving the builder the information he requires a quantity surveyor had better be employed, though, as we have said, he can never equal an architect who is also a competent quantity surveyor. If a surveyor is employed, the architect should always have the same one, as he becomes familiar with the architect's methods and with the way in which the work is desired to be done. The architect should of course obtain the client's sanction to his preparing a bill of quantities, or engaging a surveyor to do so, but if he is asked to obtain estimates (which can only be properly done by having quantities taken out) we consider he is fully entitled to do so himself or engage a surveyor to do so, and charge for the work. The architect occupies the peculiar position of being partly the agent of the client and partly an arbitrator between the latter and the contractor, and it is as an arbitrator that he acts as quantity surveyor. If he conscientiously carries out his obligations in this respect, acting honourably to all parties, no one can reasonably object, but if any one makes objection another person should be selected agreeable to client, architect and builder. It is not right to make the builder pay for the quantity surveyor or his fees, as the latter is engaged at the request of the client and should be paid by him. The absurdity of the usual method is seen in the builder having to pay for copies of the quantities supplied to his competitors. If a surveyor is agreed to by client, architect and builder (in tendering the last shows his agreement) the arbitrator's award must be put up with. Therefore, if the surveyor is engaged direct by the client without the architect's consent, the latter cannot be held responsible for any disagreement that may arise—such as may occur should the tenders largely exceed the amount the client is prepared to spend. If, however, the client can show that the architect is in error, he will of course be held responsible. Several cases bearing upon the subject will be found on p. 302 of our issue for November 14th, 1900: see also the case reported on p. 85 of this issue.

Laying Floors in Market Room.

WELLINGTON.—C. R. D. writes asking how a pitch-pine floor should be laid down over the worn boarded floor of a large market room, giving a slight spring for dancing; and also how a deal movable floor (for market purposes) should be constructed over the pitch-pine one. We learn from the expert to whom this enquiry was sent that he has already answered an identical question from the same correspondent in another journal; and we do not therefore feel disposed to publish a second reply.

Setting-out Screw Threads.

LONDON, S.E.—H. C. H. M. writes: "Kindly show me a method for setting-out screw threads."

There are many varieties of screw threads, according to the purpose for which they are to be used; there are also various conventional methods of drawing them besides the two geometrical projections of the helical curves. You do not say which you require. The accompanying sketch, Fig. 1, shows the ordinary working drawing of a thread of a lin. bolt, the principle of the construction being indicated in the enlarged and somewhat exaggerated view, Fig. 2. It will be observed that the threads are

SETTING-OUT SCREW THREADS.

right-handed, i.e. inclined upwards to the right and requiring the nut to be screwed on clockwise. This inclination of the thread causes it to form what is called the pitch, i.e., the rise performed in one revolution. The depth of the thread is drawn equal to the pitch, though in reality it is rather less, owing to the rounding off at the top and bottom. It is called a plus thread when it stands out from the main diameter of the rod, as in good tie-rods, and is called a minus thread when it is cut in below the general diameter of the iron, as in ordinary bolts. If this information is not sufficiently complete a further query should be sent.

HENRY ADAMS.

Taking Levels.

CARLISLE.—K. L. writes: "Can the levels of a building site be taken sufficiently accurately with a balance level to make it worth an architect's while to buy one for use on small jobs and for taking preliminary levels of larger ones?"

Yes.

Carrying Roof-Trusses over Opening.

LONDON.—ENQUIRER writes: "It is proposed to add a new wing to a building, and the wall which supports the roof-truss is required to be taken out. Would the method shown on the accompanying sketch (not reproduced) be the best to adopt? No columns or girders are to be used. Kindly give dimensions for members of new truss."

The sketch submitted is so rough that there is considerable doubt as to the work required. Apparently only one roof-truss is to be carried over the opening and no other truss is shown between this and the gable wall about 18ft. distant, which is not likely to be correct. Taking the load to be carried as 5 tons at the centre of the 20ft. span, a 10 by 6 by 45lb. rolled steel joist would be the simplest support, with a 12 by 6 by 1/2 wrought-iron plate screwed up under the end of the existing truss to spread the pressure. The new trusses could then be made of ordinary scantlings. Gable boards may be tenoned and pinned into finial; mitring as shown would be of no use.

HENRY ADAMS.

Section of Compound Girder.

C. F. M. writes (but does not give name or address, which is contrary to our requirements): "I have to construct a girder of the following section II. The load is 40 tons distributed and the space 16ft. I wish to use two 12in. by 5in. girders, and find from a manufacturer's list that a 12in. by 5in. will carry 13.75 tons over 16ft. How can I determine the size and thickness of the top and bottom plates required? Also, how could I determine the sizes, &c., of the complete section?"

Designing and calculating girders cannot be explained fully in the reply to a query, as there

are so many points requiring consideration. A study should be made of such a work as "The Practical Designing of Structural Ironwork" (E. & F. N. Spon, 125, Strand, London, W.C., 8s. 6d.) and Part I. of second series of "Designing Ironwork: Steel Girders" (Spon, 1s. 6d.). With built-up or compound girders the formula $\frac{wl}{8d}$ should be used and the depth assumed, but

when the depth is less than $\frac{1}{15}$ of the span a

higher factor of safety must be used to provide against undue deflection. Two 12 by 5 by 39lb. rolled steel joists with two 12 by $\frac{1}{2}$ in. plates will carry 40 tons over 16ft. span with a factor of safety of 4 to 5 according to quality.

HENRY ADAMS.

Lighting Billiard-room.

WINDERMERE.—LIGHT writes: "I am about to build a billiard-room 23ft. long, 18ft. 6in. wide and 11ft. 6in. high (bedrooms over). The walls on three sides are to be arranged for pictures. I propose to put in two windows at each end 7ft. by 3ft., and two of the same size on the side, with the fireplace between, the windows to be 6in. below the ceiling and the sills inside to be slightly sloping. Would there be sufficient light from these six windows to show up the pictures fairly well?"

If you can possibly manage it a toplight is the best. However, if the conditions preclude this we think you have done the best in the circumstances by getting the most light from the sides. There would be plenty of light for the pictures.

Responsibility of Architects for Lifts.

J. P. J. writes: "We are the architects for extensive additions to an hotel, part of the extensions being the installation of hydraulic passenger- and dinner-lifts worked by a water tank which existed before the alterations commenced. We obtained estimates in the ordinary way without any express instructions from the directors as to speed. After the estimates were obtained and submitted to the directors the matter remained in abeyance for a time while the directors instructed an expert to advise them as to the most economical power to be used, hydraulic or electric. The expert's report, which was handed to us, stated that the existing 4in. main would be sufficient, but we made an error in reading that the 4in. main referred to was the main for driving the passenger-lift, whereas it referred to the 4in. pipe by which the water was pumped by steam-power up to the tank. Consequently, we informed the makers of the lift that 5in. mains would not be required, with the result that the lifts do not work as quickly as the directors wish, and they have obtained estimates for increasing the speed, an alteration which would cost £350, which amount they intend claiming from us. We should be glad to know your opinion on the matter. After the estimates were sent in the directors decided that the passenger-lift should go up a floor higher, thereby diminishing the speed; and they also decided that the single-service passenger-lift should be made a double-service, so that the original 2in. main had to be increased to 3in., thereby diminishing the speed of the passenger-lift. At the request of the company, their consulting architect, with ourselves, drew up a report certifying that the building was completed to his and our entire satisfaction, which report the company have accepted."

You undoubtedly made a mistake in misreading the expert's suggestion as to the size of the main required, and in my opinion you are liable for any damage which may have been caused by the error. This is largely qualified by the following considerations:—You are liable, as I have said, for the damage caused by the mistake. It is not at all clear (from the case as stated) that any damage whatsoever resulted from the alteration of the main from a 5in. main to a 4in. main. It is usual in the erection of lifts to leave a considerable margin of power, which precaution no doubt was adopted by the expert in this case, and it is very possible that were it not for the alterations in the extended height the lift had to run, and the double-service required by the directors after plans and estimates had been accepted, the existing power would have been quite sufficient

to give them the speed they required. Of this you are the best judges. If you are of the opinion that a 4in. main would give power sufficient to supply the required speed, were it not for the alterations in the plans made by the directors against your wish, then in my opinion no damages, or at most only nominal damages, could be recovered against you; if, on the other hand, the slowness of the lift is the undeniable result of your error, then the amount of the damages recoverable against you will be the amount of the injury suffered by the company; in other words, the amount the owners will have to pay to put their premises into that condition in which they would have been were it not for your mistake. There is another consideration and a very important one altogether outside the question as to whether or not any injury has occurred to the company's property by your negligence and mistake. This consideration is, have the works executed and modifications made by you (whether by error or otherwise) been adopted and ratified by the directors? If such is the case, there is no doubt you have a perfect defence to any action they may bring. I am of the opinion that the directors have ratified what you have done, and waived any claims against you in respect to the lift to any mistake you made regarding the reading of the expert's report. What makes me form a rather strong opinion on this point is that the defect in the lift (*i.e.*, the speed which was self-evident on a trial) was a patent not a latent defect; such being the case, if the chairman and directors of the company, their consulting architect, and your employers examined it, it must have been self-evident and could not have escaped their notice. You state this examination was made and the work passed. If this was so, I consider you have a complete defence against any action which may be brought against you by the owners or your employers.

W. JOHNSON-ROBERTS.

School Planning.

LONDON, N.W.—A. A. W. writes: "Where can I obtain information about the planning of a first-class boarding school for boys in a country town?"

"School Architecture," by E. M. Wheelwright, to be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C., price 21s. nett.

Temple at Eleusis.

KETTERING.—LEIGH writes: "Where can I obtain particulars of the Ionic temple at Eleusis, a plate of which is shown in Mr. Phené Spiers's book on the Orders?"

See p. 93 of our issue for September 5th, 1900.

Books on Hospitals.

LONDON, N.W.—HOSPITIUM writes: "Kindly name some books dealing with the construction of hospitals, more especially accident hospitals."

Sir Douglas Galton's "Healthy Hospitals," Sir H. C. Burdett's "Cottage Hospitals" and "Hospitals and Asylums of the World." These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

Constructing Walls.

KENT.—BORDER writes: "I am designing a country public-house, the external walls up to the first floor being 1½ bricks thick, rough-casted on the outside, the walls above this being half-timbered. Is the accompanying detail (not reproduced) suitable?"

The detail you propose is sufficient, but the proportions of the concrete are much too poor; 3 to 1 should be used, or at least 4 to 1. With 6in. of concrete there should be some cross-ties in the half-timbering.

Specific Gravity.

WALSALL.—STUDENT writes: "Where can I obtain elementary information on the subject of specific gravity? Is there any book dealing with the question?"

There are many books published dealing with the question: an elementary book giving explanations of what specific gravity is and how to ascertain it is Hugh Gordon's "Elementary Course of Practical Science, Part I." (Macmillan & Co., price 1s.).

Law Cases.

A Morecambe Architect's Claim.—The case of *Howarth v. Gardner and Another* was recently heard in the King's Bench Division of the High Court of Justice. The action was brought by Mr. Herbert Howarth, architect and surveyor, of Morecambe, against Mr. John Gardner and Mr. John Scott, proprietors of the Alhambra Palace, Morecambe, to recover £379, the balance alleged to be due for professional services in connection with the erection of the Alhambra Palace. Defendants denied that there was anything due, and counterclaimed for damages for alleged negligence. It appeared that in the summer of 1899 the defendants acquired the West End Market at Morecambe for the purpose of erecting a music-hall. In the course of the erection various alterations were made and the building, when completed, was a theatre instead of a music-hall. The total cost of the building was £25,779, including £1,579 for electric plant, £1,050 for furniture, &c., and £2,585 odd for plastic decorations.—Having carefully considered the evidence given at the trial, Mr. Justice Bucknill came to the conclusion that the plaintiff was entitled to receive from the defendants £1,312, less £1,160 which had been paid on account. He was also of opinion that the defendants had failed on their counterclaim. Therefore he gave judgment for the plaintiff on the claim for £152 and also on the counterclaim, with costs.

Bills of Quantities are not Warranties: Important

Appeal Case.—In the Court of Appeal last Wednesday judgment was given in re an arbitration between *Ford & Co. and Bemrose & Sons, Ltd.* The facts were as follows:—In 1895 the defendants, Messrs. Bemrose & Sons, Ltd., instructed Mr. Ernest R. Ridgeway, architect, to prepare plans for the erection of certain works at Derby, and to invite tenders for the work. The plaintiffs, Messrs. Ford & Co., tendered upon the architect's plans and specification, conditions of contract and bill of quantities, and with such tender furnished a schedule of prices. This schedule was for determining the amount to be paid or allowed in respect of any alterations from the original plans during the progress of the work, and the prices were referred to in the contract as the prices upon which it was based. The plaintiffs' tender having been accepted by Ridgeway on behalf of the defendants, a contract for £10,559 was entered into on May 28th, 1895. The works were completed, and on April 1st, 1897, Ridgeway gave his final certificate, showing a balance owing by the defendants of £1,530 13s. 5d. The plaintiffs were dissatisfied with the final certificate, and certain questions, disputes and differences arose between them and the defendants; and, in accordance with the contract, the matters in dispute were referred to arbitration. The arbitrator found that the quantities on which tenders were invited were substantially insufficient, and that the actual quantities of the works required exceeded those set forth in the bill of quantities. The arbitrator also found that there was a general usage in the building trade that where tenders are invited for the erection of works in accordance with plans, and a bill of quantities is furnished, a person making a tender is not expected to verify the quantities himself, but is expected and intended to assume the correctness of the quantities and to tender upon that assumption, and that if such quantities prove to be greater or less than the actual quantities the price is to be reduced or increased by an amount ascertained and determined by the scale of prices given in the tender as the scale by which payments for extras are to be determined. The arbitrator made his award in the shape of a special case. He submitted the following questions for the opinion of the Court:—(1) Whether in ascertaining the amount to be paid by the defendants to the plaintiffs regard was to be had to the aforesaid usage in the building trade. (2) Whether the plaintiffs were entitled only to be paid the sum of £10,559 mentioned in the contract, with such deductions and additions as were provided to be made in respect of alterations and deviations. (3) Whether the plaintiffs were entitled to be paid the value of all the works actually executed by them for the defendants at the prices upon which the contract was

based, whether such value should be more or less than £10,559. And he made his award in the alternative as follows: If regard was to be had to the usage in the building trade the sum of £5,090 remained payable by the defendants to the plaintiffs. If the plaintiffs were entitled only to be paid £10,559, with such deductions and additions as were by the contract provided to be made in respect of alterations or deviations from the original plans, the sum of £2,303 remained payable. If the plaintiffs were entitled to be paid the value of all the works actually executed at the prices on which the contract was based, whether such value were more or less than £10,559, the sum of £5,090 remained payable. The Divisional Court were of opinion that the plaintiffs were entitled to be paid the value of the works actually executed at the prices on which the contract was based, and they gave judgment for the plaintiffs for £5,090. The defendants appealed.—The Court allowed the appeal.—The Master of the Rolls said that the bill of quantities, though not mentioned in the contract itself, was set out on the back of the specification. It now turned out that the quantities were too small, and the question was, what was the effect of there being this mistake in the bill of quantities? The Divisional Court held that the quantities constituted a binding part of the contract, and that

of apparent hardship. But he thought the answer to that argument was that it was competent for the builder to make his own estimate, and that if he chose to rely on the architect's estimate he backed his opinion just as much as the building owner did in favour of the architect's capacity to make a correct estimate. With regard to the custom which had been found by the arbitrator, he thought it was a custom which contradicted the contract and which could not be maintained. On that point he did not differ from the Divisional Court. Dealing with the questions which had been submitted by the arbitrator, he answered the first in the negative, the second in the affirmative and the third in the negative.—The Lords Justices delivered judgment to the same effect.

House Drainage: An Appeal Case under the Public Health Act.—The case of the *Woodford Urban District Council v. Stark* was recently heard in the King's Bench Division of the High Court of Justice. The respondent notified the appellants of his intention to erect two houses in Maybank Road, Woodford, and a block plan showing a combined drain for the two houses was attached to the notice. The notice and plan were disapproved by the appellants on the report of their surveyor on the ground of unsatisfactory drainage, and they made an order under the Public Health Act, 1875, section 25, ordering

ought to decide. That question was whether a house had been built without a drain constructed in a manner approved by the local authority. They could not decline to entertain the matter because the local authority had pointed out that the drain drained two houses connected together. It was argued that although the combined construction drained two houses, yet as the two houses were one building there was no offence under the section. That was a wrong view of the legal obligation under section 25. Whatever might be the true meaning of the word "building," he thought that section 25 was a distinct enactment that a person who erected a house must provide a drain for that house. Unless that was the true view he might provide a construction which would become a sewer and impose upon the local authority the obligation of repairing it. He thought that section 25 meant that there should be a separate drain for each house, and the case must go back to the magistrates, as they were not justified in refusing to deal with it on its merits, because the complaint of the local authority was in respect of the fact that the drain was for more than one house. The other learned judges concurred, and the appeal was accordingly allowed.

Electric Light Wires in Urban Districts.—The case of *Finchley Electric Light Co., Ltd. v. The Finchley Urban District Council* was recently

the bill of quantities amounted to a warranty by the building owners that the statement of quantities therein contained was correct. In his opinion it was a well-ascertained practice that the building owner placed before the builder documents specifying the materials on which he was to make his tender. But he thought it was equally well understood that a bill of quantities, whether it formed part of the specification or was a separate document, was not intended to be a representation in the sense of being a warranty. It was an estimate which the builder might act on as an honest estimate made by a qualified person, but it was not a warranty. It could not be pushed beyond an estimate and turned into a contract. He referred to the cases of *Sharpe v. San Paulo Railway Co.* (8 Ch. App., 597), *Servener v. Pask* (L.R., 1 C.P., 715) and *Thorn v. Mayor of London* (1 App. Cas., 120) as authorities to show that a bill of quantities, though scheduled to a contract, only constituted a representation, a suggestion or an estimate, and did not amount to a warranty. The argument for the appellants really sought to substitute a contract by measurement for a contract for a lump sum. He thought it was perfectly clear that the contract with which they had to deal was a contract for a lump sum. The Divisional Court seemed to have been influenced by the argument

that a separate drain should be made for each of the houses. This section provides that it shall not be lawful in an urban district to erect a house unless a covered drain or drains be constructed of such size and materials and at such level and with such fall as on the report of the surveyor may appear to the urban authority to be necessary for the effectual drainage of such house. The surveyor on subsequent inspection found that the respondent had constructed a combined drain for the two houses as shown on the plan, and the appellants caused two informations to be laid against him—one in respect of each house—for building a house without making a covered drain or drains of such size and materials and at such a level and with such fall as appeared to the appellants necessary on the report of their surveyor. The attention of the justices was called to *Matthews v. Strachan* (1901, 2 K.B., 540). The justices were of opinion that the appellants were not entitled to take into consideration anything but size, level, materials and fall, and that they had no jurisdiction to order a separate drain for each house, and accordingly dismissed the informations. It was contended for the respondent that the two houses constituted one building.—The Lord Chief Justice, in giving judgment last week, said that it seemed to him that the magistrates had overlooked the question that they

heard in the King's Bench Division of the High Court of Justice. The company sought an injunction to restrain the council from preventing them carrying their wires over a certain road in the district. Under the Public Health Act of 1875 the road became vested in the council, who contended that they were entitled to restrain the company from carrying their wires over it. The latter, on the other hand submitted that the soil of the road was not, in fact, vested in the council. Mr. Justice Farwell said the conveyance of the land was an out-and-out conveyance, and the soil was therefore vested in the defendants. The plaintiffs, therefore, had no right to take their wires over the road, and the application for an injunction failed.

Clifford's Inn.—In the Court of Appeal last week Lord Justice Cozens-Hardy's decision was upheld that Clifford's Inn, behind St. Dunstan's Church, Fleet Street, had been dedicated to public or charitable purposes and could not therefore be disposed of by the present sixteen members of the Inn.

"Cherrycroft," Forest Row, Sussex.—The architect of these buildings is Mr. E. W. Marshall. A somewhat similar house by Mr. Marshall—"Tanglewood," Godstone—was illustrated in *THE BUILDERS' JOURNAL* for January 1st last.

ARCHITECTURAL ASSOCIATION.

THE VILLAGES OF PORT SUNLIGHT AND THORNTON HOUGH.

By W. H. LEVER.

A MEETING of the Architectural Association was held on Friday evening last at 9, Conduit Street, W., the president, Mr. W. Howard Seth-Smith, occupying the chair. After the minutes of the last meeting had been read and confirmed, Messrs. A. W. Heath (London S.E.), R. D. Wells (London, W.) and C. H. Wheeler (London, S.E.) were elected members of the Association. The president then announced the following additional donations to the New Premises Fund:—

	£	s.	d.
C. E. Bateman	-	-	5 5 0
N. F. Barwell	-	-	4 4 0
W. J. N. Millard	-	-	2 2 0
D. T. Fyfe	-	-	1 1 0

Donations previously announced 12 12 0
3,944 15 6

Total £3,957 7 6

Some donations to the library were announced and Mr. W. H. Lever then read his paper on "The Villages of Port Sunlight and Thornton Hough." He said:—

The history of Port Sunlight is soon told. Our works were started in Warrington in January, 1886, and in the autumn of 1887, the site being found to be too small for our rapidly-growing business, it was decided that the best course would be to remove entirely to some rural district where ample acreage could be secured adjacent to both rail and water transport, with reasonable facilities for obtaining the necessary supply of labour. Rightly or wrongly, the River Mersey was selected as the best for our business, the land chosen being on the Bromborough Pool, situated about five miles from the centre of Birkenhead and about seven miles across the river from Liverpool Town Hall. Our first purchases were about fifty-six acres of land, of which twenty-four were intended for the business and works and thirty-two for the village. From time to time the area was added to by purchase as opportunity offered, until to-day the area is 230 acres, of which about ninety acres are devoted to the business and 140 to the village. The ninety acres devoted to the business are of no interest to us now, and therefore we will confine our attention to the village.

The ravines or gutters, up which to a greater or less extent the tide used formerly to flow, we have filled up and levelled the land at the bottom of the ravines, but only so as to raise it above high-water mark. This leaves the ravines available for use as parks and recreation grounds, and so treated they will become the feature of the village. At the junction with Bromborough Pool a dam is in course of construction, which will cut these parks off from the incoming tides and also serve to carry a road at that point across the pool. The roads have been so planned that whilst making direct and shortest ways to important points, they shall still form wherever possible curves and sweeps following the lines of the ravines. Another object aimed at in the laying-out of the village has been that none of the houses should have their backs to the railway line, a matter which is little thought of in laying-out building land adjoining railways, though I know of no feature that ought to have more careful attention.

Roads and Bridges.

The general width of the roads has been fixed at 40ft.—say, 8yds. roadway and 8ft. each for footpaths—but our widest road is 12yds. for road and 12ft. for footpaths. I don't know whether it is a recognised rule to make the footpaths as many feet wide as the roadways are yards in width, but I have always found this to give a most excellent proportion. In order to realise the intention of leaving the ravines as parks and recreation grounds, and at the same time not diverge from the directness of the roads to adjacent local centres, the ravines had to be spanned at several points, and with two exceptions where bridges have been built, this has been done by means of banks of earth. In building these bridges the intention has

been to add distinct objects of interest to the village.

The first of the two bridges is the one near the schools, spanning the park at that point. It was designed by Messrs. Douglas & Fordham, of Chester, and forms one of the most charming features of the village. The second bridge carries Bolton Road across the ravine to its continuation to New Chester Road. This bridge was built from the designs of Messrs. William & Segar Owen, of Warrington, and it would be difficult to imagine anything more solid and strong, yet light and graceful. It is an ideal structure for the purpose for which it was designed. At the time the bridge was built we did not own and could not then readily acquire the land bounding the north-western buttresses of the bridge. The ravine, therefore, for many reasons, could not be spanned by an embankment.

The Open-Air Theatre and Swimming Bath.

The total area occupied by ravines is 121,000 sq. yds., or about 25 acres. Adjoining one of these ravines we are erecting a gymnasium, using wood as the building material. In another we are erecting an open-air theatre, which for want of a better name will be called the auditorium. The sloping banks of the ravine allow of a perfect arrangement of seats somewhat on the lines of the classic Greek theatres. Of course I know it is somewhat risky to build an open-air theatre in this uncertain climate, but the view taken is this, that we may possibly rely on four months during which we shall find this theatre extremely useful; and as the cost of such an open-air theatre is certainly not more than one quarter that of a fully-enclosed building, it appears to be a fairly economical arrangement. In addition, is it not desirable to cultivate more the capacity of our English climate for open-air summer amusement? However, in any case it will be an interesting experiment. Adjoining another of the ravines and occupying a triangular piece of ground that otherwise could not have been profitably used, an open-air swimming bath has been made. The shape of the bath is oval—length, 100ft.; breadth 75ft.; 3ft. deep at one end and 7ft. 4in. at the other; with wooden dressing-rooms placed in convenient positions.

Gladstone Hall.

What I may call the first public building to be erected at Port Sunlight was the Gladstone Hall, opened by the late Right Hon. W. E. Gladstone in November, 1891. This, in my unprofessional opinion, is the most appropriate village hall we have. It has for long been too small for the needs of the village, and therefore an additional dining-hall has been built, at present devoted entirely to the use of the women and girls of the works and village. This hall is called

Hulme Hall,

and was designed by Messrs. William & Segar Owen, of Warrington, than whom no one has been more happy in their work at Port Sunlight, to whom also we are indebted for the quiet grace and beauty of the earliest buildings in the village which have given to it its distinctive English village character. Probably the difficulties connected with the size of Hulme Hall were greater than appear at first sight, the problem being to provide dining accommodation for not fewer than 1,500 people seated at small tables—say six persons at each table. The effect produced on one's mind by Hulme Hall is not that of a village building, but rather as showing what can be done with unlimited money lavishly spent, which is perhaps the least useful lesson village architecture should teach. However, the hall answers its purpose most admirably, and should prove to be a centre of life for the village as long as the village is in existence. The cooking arrangements are most admirable and perfect.

The Village Post- and Telegraph-Office.

At about the same time that we built the Gladstone Hall we built a block of cottages, with a shop at one end of the block. This shop is now used as the village post- and telegraph-office and is well worth attention. The half-timber work in it is solid oak, employed, as nearly as the modern Building Acts will allow, in exactly the same way as it would have been employed had the shop been erected 300 years ago. The same remark applies practically to

all the half-timber buildings at Port Sunlight, although there are, I think, one or perhaps two cases where this has not been strictly adhered to. The village stores used to be at this shop, but the growth of the village soon rendered it too small, and therefore large central shops were built from the designs of Messrs. Douglas & Fordham, of Chester. These are managed by the employees themselves entirely, and whatever capital is employed is provided by themselves, and whatever profits are made are divided amongst themselves.

Over the entire area of the three shops is

The Girls' Institute.

with large central hall and side classrooms, the latter formed by movable wooden screens, so that when required they can be thrown into the central hall. This is the girls' club of the village, and one of our most useful institutions: though it does not quite correspond to the Men's Social Club, being a more educational institution than the men's club. This latter was built from the designs of Messrs. Grayson & Ould, of Liverpool, and has proved a most useful and successful building for its intended purpose. It contains the usual accommodation for billiards, games, reading, &c., inside, with a full-sized bowling green adjoining. Opposite the men's club is a range of buildings with a "past." Its present use is as an addition to the school accommodation of the village. Its original use was to provide a series of four homes for girls, but these never attracted more than a dozen girls at one time, and finally they had to be closed and adapted for other uses.

The School Buildings.

But the buildings of which we are most proud at Port Sunlight, both architecturally and otherwise, are the school buildings, built from the designs of Messrs. Douglas & Fordham. All the social work of the village centres round these buildings. Additional schools are now in process of building from the designs of Messrs. Grayson & Ould, which, when completed, will raise the school accommodation to a provision for over 1,500 scholars. A church is also being built from designs by Messrs. William & Segar Owen. In building itself the aim has been to produce an honest piece of work, worthy of the purpose for which it is intended, with every detail, both inside and outside, speaking of thoroughness and truth, and with such ornament only as would add dignity to the building and produce a feeling of reverence in those worshipping within or viewing it from without.

The Village Inn.

I must not forget to take you to our village inn—called Bridge Inn—built from the designs of Messrs. Grayson & Ould. It is unlicensed, and it is not intended to apply for a licence for the sale of intoxicants. The inn is one of our most successful and useful buildings, providing easily day accommodation for many hundreds of visitors, with a few bedrooms sufficient to meet all the demands of visitors requiring to make a longer stay in the village. Considering the difficulties to be overcome in securing all that was demanded of the architects at a cost within the means placed at their disposal, this is certainly one of the successes of the village.

And now, before leaving Port Sunlight and proceeding to the little village of Thornton Hough, let us examine the various types of cottages built at Port Sunlight. We have really two standard types only—the cottage and the parlour house—although we have about half a dozen cottages which have less accommodation than the standard type of cottage, and perhaps a dozen larger houses, occupied by our clergyman, doctor, schoolmaster, managers and heads of departments, which, however, present no special variation from the usual villa or moderate-sized family house.

Standard Type of Cottage.

We will, therefore, pass these exceptions over, and devote ourselves to the consideration of the standard type, which really is the type for 97 out of every 100 houses. In planning the standard type the idea has been, firstly, to provide a garden as foreground to the cottage and screen from the road. These front gardens are in every case kept in proper order and cared for by ourselves. We have found by experience that no other plan is successful in securing a character to the village and avoiding the

unsightliness of here and there the obtrusion of neglected plots of garden which would mar the whole effect. This care by ourselves of front gardens is effected at a cost of 3d. per garden per week. In addition to these front gardens we have also allotment gardens to almost each block of cottages. These allotments the tenants cultivate themselves as vegetable gardens, or properly fence and use for poultry, &c. These allotment gardens are placed as near as possible to each cottage and are the very safety-valve of the village.

The accommodation in the cottage type provides for three bedrooms upstairs, and living-room, kitchen, scullery, bathroom and larder on the ground-floor, with enclosed yard and usual outbuildings. Our experience leads us to believe that any variation from dimensions chosen has not been popular with the villagers. If the rooms are made larger it entails more work on the wife than she is able to devote to their care, and therefore the house soon loses its tenant. On the other hand, if the rooms are smaller they will not accommodate the necessary furniture, with a like result. In fact, a workman's cottage must fit like a glove the wants of a tenant if it is to be a successful attempt to provide for the happiness and comfort of himself, wife and family. Having settled by experience the most suitable type of cottage, it has been adhered to in all the cottages at Port Sunlight and Thornton.

The parlour cottages differ from the ordinary cottages in having an additional bedroom on the first floor and a parlour on the ground floor. In a few cases the scullery in these houses has been fitted with a kitchen grate, so that all the cooking could be done there, leaving the kitchen to be used as a dining-room. The general type adopted for the parlour houses has proved popular, and therefore has been settled upon as permanent.

The Financial Aspect

of the village at Port Sunlight is soon told. The capital it has taken to buy the 140 acres of land, build the cottages, houses, schools, shops, institutions, clubs, &c., and including making the roads, laying-out the parks, &c., has exceeded £350,000. Our standard type of cottage thirteen years ago cost us £200 each to build, and identically the same cottage in 1901 cost us £330 to build. The parlour houses cost us then about £350 each to build and now about £550 each. Upon this £350,000 Lever Brothers, Ltd., receive no interest or return whatever, the rents being fixed at such an amount as only to pay for rates, taxes, repairs and maintenance. The rents have had to be increased from 3s. per cottage per week to 5s. per cottage per week owing to increased cost of maintenance of parks and roads and of the cottages themselves. The cost of repairs has gradually grown to extravagant proportions owing to the fact that every tenant has been allowed practically any repairs he asked for. This was allowed because the tenants as a whole paid the total cost of repairs and maintenance, but this system does not bring it so clearly home to individual tenants that extravagance in requests for skilled workmen for trivial repairs is expensive. There are clear indications shown by the reduction in the number of such requests during the last six months that the last raising of the rents is having a good effect. From our experience, therefore, it appears that with the most economical expenditure on repairs and maintenance the rental of a cottage to cover rates, taxes, repairs and maintenance would be 3s. 6d. per week and of a parlour house 5s. 6d. per week, and that out of such rental nothing would be available as interest on capital outlay.

Return in Percentages.

Taking the value of the land at £240 per acre, and taking ten cottages per acre as the maximum number possible per acre, after allowing the proportion of each cottage for parks and recreation grounds, we should have a total cost for cottage and land of £354, which at 4 per cent. interest and 1 per cent. depreciation (in addition to cost of maintenance already provided for) is, say, £17 14s. per cottage per annum, or say 6s. 10d. per cottage per week. Adding this to the cost of rates, taxes, repairs and maintenance, we have a rental of 10s. 4d. per cottage per week as the letting value of the cottages of Port Sunlight on an ordinary commercial basis. Taking the rate of interest at 3 per cent. and of depreciation at $\frac{1}{2}$ per cent.,

the sum of 4s. 9d. per cottage per week would be sufficient to meet these, and consequently a gross rental of 8s. 3d. per cottage per week would be sufficient.

A Commercial Impossibility.

My object in mentioning this is to draw attention to the fact that to build a village such as Port Sunlight is not commercially possible at the present time. To ask either of the above rents would be to place the possibility of living in such a village out of the reach of ordinary village tenants. How can the difficulty be met? There are only two possible channels of reduction—cheaper land and less expensive buildings. The value of the land for cottages is fixed by the number of cottages the law allows to be built upon it. If the legal maximum were twelve cottages per acre, as it ought to be, it would be impossible for land for cottages to reach a higher value than twelve cottages would bear. The present Building Acts allow of forty-five cottages being crushed like sardines in a box on one acre of land. The effect of this absence of proper restrictions operates in all cases to the raising of the value of the land. In Liverpool this is seen by competitions amongst builders themselves, who elevate to the level of a fine art the study of how many cottages can be squeezed upon a given area. The ingenious builder who can see his way to squeeze the most houses on a given plot of land sees his way at the same time to give the highest price for the land and so to secure it. The only remedy is the restriction of the number of cottages to be built upon a given area of land—to, say, twelve cottages per acre. This will allow 400yds. of land for cottage and garden, and proportion of roads and open spaces for parks and recreation grounds. This is the maximum limit possible for maintenance of healthy life. A limit of ten cottages per acre, or 480yds. per cottage would be better.

Cost of Building.

The next consideration is the cost of building, and I venture to suggest that there is here a magnificent field awaiting the attention of our best architects. This subject should not be left to the unaided efforts of what we often thoughtlessly call the jerry-builder, a man who is in my opinion a most useful member of society—more sinned against than sinning. The so-called jerry-builder has to make the most of an almost impossible position—to satisfy the demands of the public for cheap dwellings, regardless of consequences—and I maintain that, building upon dear land, he does all that can be done with the materials at his disposal. If our best architects would only come to his assistance by studying the present-day requirements to be provided for in dwelling-houses, the cheapest and best materials for the purpose, the preparation of the same by machinery, as far as possible, rather than by hand-labour; to study the saving to be effected by the erection of dwelling-houses in large masses rather than singly, and to do so with greater effect and less monotony than by building as at present; in fact, to raise architecture in relation to the dwellings of the million on to broad comprehensive lines, so as to rest on the only true basis that architecture can ever occupy—the supplying of the requirements of the age with economy, simplicity and character. Modern domestic architecture requires to adapt itself to the requirements of the twentieth century in the same way that naval architecture has done in shipbuilding, and to accomplish as much by disregarding traditions as to building materials in supplying the demand for dwellings for the masses of the people as naval architecture has done by disregarding traditions as to shipbuilding materials in supplying our present-day demands for ships.

Cottages to Last Fifty Years.

We know that for certain buildings which must be monumental and important we are not likely to discover better building materials than stone, granite or marble. But dwellings for the masses of the people need not be monumental. If they can be inexpensively built to stand absolutely sound, weather-proof and sanitary for, say, fifty or sixty years, they will better supply the present-day requirements than if by increased cost they were built to

stand good for 300 years. The changing life of our citizens, the necessity that is laid upon them to follow their employment wherever it may lead them, and the fact that our experience teaches us that in fifty or sixty years the site of cottages may in all probability be wanted for other purposes—all point to the present-day requirements in cottages being not for cottages to stand hundreds of years, but tens. Understand I am not speaking of the building of villas or mansions, say, from £70 a year rent and upwards. I only refer to cottages and what for want of a better word I may call "parlour houses," the rentals being from a few shillings a week to say £30 or £40 a year. I know of no greater service the architects of the country could perform during the new century than the designing of such economical cottages and small houses to endure for fifty or sixty years only.

We will now pay a short visit to

The Village of Thornton Hough.

Here the problem was not how to build an entirely new village, but how to rebuild an old one. The exterior of some of the old cottages in the village were very picturesque when seen in fine weather, but unfortunately the more picturesque the exterior appearance the more dirty, dark, damp, unhealthy and at variance with all ideas of common decency was the interior. The villagers in many instances, but not every one, were attached to these old ruins, one tenant remarking: "If yer touch the roof ye'll push the walls out, and if yer touch the walls ye'll have the roof down." However, all difficulties in the end were overcome. Only the irreclaimable cottages were pulled down and new cottages built in their place. Cottages offering the slightest possibility of reformation were altered, repaired and adapted to modern requirements. The new cottages were not always built on the site of those pulled down, but as far as possible this was done so as to preserve the general outline of the village. A score or more of additional cottages have been added to the village to supply the growing need of the agricultural and farm labourers of the parish. I have confined the tenancy of the cottages to the village labourers, and in consequence have only about 1 per cent. of direct return on the investment. I have, however, the satisfaction of knowing—if that is any satisfaction—that under present building possibilities, however "jerry" and however plain and ugly I might have built, at the rentals which village labourers can afford to pay the result as an investment would have been little different. Messrs. William & Segar Owen, of Warrington; Grayson & Ould, of Liverpool; and Douglas & Fordham, of Chester, are the architects I was fortunate enough to secure to design and carry out the work. The same general plan or type of cottage has been adopted at Thornton as at Port Sunlight, and the same provision for gardens and recreation grounds has been made.

Some Early Reminiscences.

And now allow me to explain, in order that you may understand my position and work better, that I have always wished that I had been an architect. I have been building since when, at nine years of age, a lean-to rabbit hutch absorbed all my spare time for that year. The following year this rabbit-hutch appeared to be capable of extension, and it was pulled down and rebuilt on a more extensive scale, allowing a number of small boys to stand upright inside the hutch. The third year saw a further development in carrying out a startling idea, that of covering the roof with soil to the depth of about 6in. and planting oats therein with the object of raising food for the ever-increasing stock of rabbits. But, alas! "the best laid plans of mice and men gang aft agley," to say nothing of those of architects and builders; for although the corn grew luxuriantly in the early spring, it all withered away in the summer heat, and so this economy of space, which had it proved practicable might have done so much for distressed agriculture, had to be abandoned. Nothing discouraged as far as my building instincts were concerned the year following I built a pigeon-cote, and so on, each and every year finding me engaged in some building operation, right up to the present time.

Gentlemen, there is no career that opens up such immense possibilities for influencing the world in which we live as that of the architect, and yet architecture is one of the least remunerative of the professions. Why it should be so I fail to see, yet it does appear to me from my own observation that, attention once directed to money-making as an aim and object, art vanishes. No, if money-making is to be the aim and ambition of life, then architecture is not the calling to follow. But money-making is not the highest object of life, but service to our fellow-men, and in my humble opinion an architect's career is one of the most serviceable in the whole range of honourable callings.

The Discussion.

In reply to questions Mr. Lever said:—As to the birth and death rates at Port Sunlight, these are respectively 56 and 10 per thousand, the one being double and the other half that for the United Kingdom. This is in measure due to the fact that the villagers are mostly young people, but it is important to note that the infant mortality is very small—which speaks much for the healthiness of the village. I have a great objection to a long view of backs of houses and therefore the corners of the streets have been turned. This contravenes the by-laws and the plans were sent back: but I told the authorities I had decided to build according to my plans, and they could take what action they liked. As regards the effect of trades-unionism, we pay a high rate of wage and find it best to do so: for we thus obtain a better selection of men. As to railway companies acquiring land for housing purposes when laying down new lines, I am not a believer in them. The Lancashire and Yorkshire Railway Co. had works at Barry and Miles Platting: these became too small, and a farm near Manchester of 200 acres was bought by proxy at £50 an acre; but the company erected their new works in exactly the same unsatisfactory condition as the old ones; so that after work the employees even preferred to go home to the former district. At Port Sunlight the wages average from 20s. to 50s. a week. Nobody who earns less than 25s. can have a cottage costing more than about 4s. 3d. a week, while those earning higher wages can rent the "parlour houses" at about 5s. 6d. a week. When we first started the land cost £200 an acre, now it costs £500 and more. With one exception all the institutions are entirely under the control of the villagers. Thornton Hough is purely agricultural.

The president announced that a special meeting of the Association would be held on Friday, April 4th, to consider the amendment of by-laws.

Builders' Notes.

Mr. John Hodge, builder, of Clinton Road, Redruth, died recently at the age of sixty-six.

Mr. John Kay, a master-joiner and builder, of Heywood, died last week at the age of sixty-one years.

London County Council.—At last week's meeting of the Council a report was submitted by the General Purposes Committee dealing with the formation of a new Works Committee, who shall be responsible for the management of the Works Department. It was recommended that the Committee should consist of seven persons. Mr. W. Peel, M.P., said he noticed it was proposed to keep separate accounts in such a manner as to show the cost of each job. If that had been done in the past they could have told how many bricks per day had been laid. After discussion, the recommendations were adopted. The Council then proceeded to deal with an urgency report of the Committee recommending that the following form the Works Committee:—Lord Welby, Messrs. W. Bruce, E. A. Cornwall, L. Sharp, E. Smith, A. M. Torrance and D. Waterlow. This Committee was eventually agreed to.—The Council approved the estimate of £14,250 required for widening Old Street to about 60ft.—It was agreed "that, taking into consideration the long distance between Battersea and Wandsworth Bridges, it be referred to the Bridges Committee to consider and report as to the advisability of providing direct means of communication between Fulham and Battersea."

Bricks and Mortar.

APHORISM FOR THE WEEK.

*If Art be, in truth, the higher life,
You need the lower life to stand upon,
In order to reach up into that higher.*
MRS. BROWNING.

Our Plates. A DESCRIPTION of the Church of the Sacred Heart, Paris, appears on p. 82 of this issue, on which page also some particulars are given of the houses in Cheyne Walk designed by Mr. C. R. Ashbee.

Speyer Cathedral. ARRANGEMENTS are being made for carrying out the restoration of the tombs of the old German Emperors in the cathedral at Speyer, the Bavarian Parliament having granted 120,000 marks for the purpose. In the new vault below the so-called King's Choir bronze tablets will be affixed to the walls bearing the names of the persons here buried. Above the King's Choir there will be an Imperial crown of gilded copper, a cross and twelve hanging lamps. The destruction of the Imperial tombs by the French in 1689 was not so complete as is sometimes supposed. They opened and destroyed, however, four tombs. The other tombs they did not touch. It has now been found possible to separate the remains found in the destroyed tombs and amidst the *débris*. The remains of the Empresses Bertha and Gisela and of the Emperors Conrad II., Henry III. and Henry IV. are now resting in their original stone sarcophagi; while those of Henry V., Beatrice, Agnes, Philip of Suabia, Rudolph of Hapsburg, Albert of Austria and Adolph of Nassau are carefully preserved in temporary wooden coffins in the Cathedral Sacristy. The excavated space beneath the King's Choir has been covered temporarily with wooden planks. The bodies will ultimately be buried either in the original or models of the original coffins of metal, which are to be placed in stone sarcophagi and deposited in the vault beneath the King's Choir.

South Shields Municipal Buildings Competition.

THE report of the Municipal Buildings Special Committee on the further plans which have been prepared by the six architects selected to compete for the new award has been approved by the South Shields Town Council. The original designs were based upon a limited cost of £25,000, which sum was subsequently considered inadequate for a pile of buildings on such a magnificent site as Ogle Terrace. It was therefore decided to ask the six best competitors to send in new designs based upon an expenditure of £35,000. The Committee report that these designs were submitted to the adjudication of Mr. J. Belcher on the 19th of February and his report was read on March 5th. He states that the six sets of revised designs have all been carefully worked out in compliance with the conditions and fully justify the selection made for the second competition. He had no hesitation in placing first the design marked No. 2. It was an admirably-arranged plan, and the several departments were conveniently placed. The cost of this design, taken throughout at 1s. 2d. per ft., have been placed by the author at £35,000, but on the cubic capacity furnished by the borough surveyor it amounts actually to £31,875 nett, this cost being considerably less than any of the other five works, none of which could be executed for the sum stipulated. The Council has decided to adopt Mr. Belcher's selection; and on the envelope being opened the name of the author of design No. 2 was found to be Mr. Ernest E. Fetch, A.R.I.B.A., of London. Mr. Fetch won the award in the first competition.

The Discoveries at Greenwich.

RECENT searches in Greenwich Park have resulted in unearthing the floor of a Roman room, the greater portion with the tesserae intact. Mr. A. D. Webster, the superintendent of the park, considers that the remains advance a theory which he has long contended for—that the Roman road from London to Dover ran through Greenwich Park instead of Blackheath, as has been generally accepted. The evidence was now strengthened that the historic road

passed through the park and Silver Street, thence through Deptford. The floor was unearthed about 2ft. below the surface, and under careful treatment the work in cubes of red tile was exposed to view. Other finds which lend additional interest to the excavations consist of a collection of coins apparently of the periods of Hadrian and Constantine, and of pieces of figured pottery and ornamental wall-plaster. The places where the excavations have been made—which are situated on the crest of the hill to the west of the Observatory and on the Blackheath side of the Royal Park—have been fenced round.

The Turin Decorative Art Exhibition.

MR. WALTER CRANE and Mr. Edward S. Prior state that the English section of the International Decorative Art Exhibition at Turin, which opens in April next, will by invitation of the Turin Committee consist of (i.) a special exhibition of the Arts and Crafts Exhibition Society, as a society, and (ii.) a collection of the works of Walter Crane. There will be also an industrial British section and a Scottish artistic section. It was desired by the Turin authorities to have also an exhibition of the work of the students of the British schools of art, but as our Government were not able to grant any money towards the expenses this project had to be given up. The collective exhibit of the Society is the feature to which they wish to call attention, this exhibit including most of the artists, both members and non-members of the Society, who have exhibited at their London exhibitions. By the courtesy of the authorities of the Board of Education and of the Victoria and Albert Museum, and of others, they have been able to send some works of William Morris, which were specially desired by the Turin authorities, as well as the examples of living artists.

St. Peter's, Colchester.

ANOTHER step towards the restoration of St. Peter's Church, Colchester, has been effected by the renovation of the chancel, which completes another section of the general scheme sanctioned in 1894. The walls of the chancel have been raised and a Perpendicular window, glazed with cathedral tinted glass, now fills the space previously occupied by the remains of an old window and the picture formerly fixed on the gable wall. The old ceiling, too, has been replaced by an open timber roof with moulded ribs. The communion rails have been moved eastwards and clergy desks placed under the chancel arch. The floor is to be paved with red and grey Devonshire marble, with a marble step at the communion rails. The space under the window has been filled in with oak panelling, similar to that on the north and south walls of the chancel, a suitably carved panel being placed in the centre. The chancel will in future be illuminated with the electric light. The total cost of the work will be about £570.

A Ruskin Memorial.

MR. J. HOWARD WHITEHOUSE, hon. secretary to the Ruskin Memorial Committee, says that since the death of Mr. Ruskin the council of the Ruskin Society of Birmingham has had under its consideration the question of promoting a memorial to him, and has now formed a national committee for the purpose of carrying out the following scheme:—It has been decided that the memorial shall take the form of a village library, art gallery and museum. The scheme has been placed before the trustees of the Bournville Village Trust, and they have presented free of all cost an adequate site for the memorial. It is therefore proposed to erect the memorial on this site, where it would be of use to the populous districts of Selly Oak, Stirchley and other places, which are at present wholly without any such institution. The memorial committee includes the Bishop of Ripon and the Dean of Ely. It is estimated that the cost of the building and its equipment will be about £10,000, and a further sum will be required for the purpose of endowment. The memorial committee invite the co-operation of all lovers of Ruskin in order to assist them in carrying the scheme into effect, and the hon. secretary will be pleased to receive subscriptions towards the memorial.

IRRATIONAL ANCIENT LIGHTS.*

THE LAW IN FOREIGN COUNTRIES.

By WALTER C. WILLIAMS, Solicitor.

I WILL not occupy your time with any preliminary remarks, but commence at once *in medias res* and say my contention and conviction are that the state of the law in England to-day with regard to rights of light is little if any short of an iniquity.

The Prescription Act (2 & 3 Will. IV., c. 71, s. 3) enacts: "That when access and use of light to and for any dwelling-house, workshop or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding, unless it shall appear that the same was enjoyed by some consent or agreement expressly made for that purpose by deed or writing."

The result in practice is that, where two men own two contiguous plots of ground and one owner wants to build and does build at once and the other owner does not want to build, then, notwithstanding that he may have every intention of building eventually, if owner No. 2 postpones his operations for nineteen years he is unable to use his own land in accordance with his desire without being hampered by certain so-called rights his neighbour has acquired to access of light to his windows and other openings over No. 2's land. In effect, my neighbour can dictate to me at what period I am to build on my own land by building on his own.

Again, if both owners build simultaneously but A builds a higher or longer edifice, B, if he is ever to increase the size of his building, must do so within nineteen years of A's completion or be practically debarred from doing so altogether, regardless of whether B has any need or wish, or even whether he is able, to extend his premises within that time.

Now how can an owner prevent his neighbour acquiring a right of light over his land? In one way, and one way only, and that is *actual obstruction*.

He may protest in the most emphatic and solemn manner, but it avails him nothing; he may give notices, but they afford him no protection. No, wherever his neighbour has an opening in his building overlooking his land or buildings, he must erect a hoarding (should he not wish to build permanently) opposite to it. The hoarding may have to be 60ft. high and 500ft. long, may be a hideous eyesore to the surrounding property, may be a most oppressive, even ruinous, expense; but up it must go, and must be retained there for a full year, for section 4 provides that an interruption to be valid must be for one complete year. Hence, as soon as light has been enjoyed for nineteen years and one day there cannot be an interruption of one clear year before the expiration of twenty years from the time of its first enjoyment, though the owner cannot bring any action until the full twenty years have elapsed. It is obvious that in some cases this remedy may be as costly as the value of the land.

[Mr. Williams here proceeded to give a brief historical sketch of the cases constituting the law of ancient lights, and then quoted the dicta of several judges to prove that the law was in urgent need of reform.]

In conclusion I will refer to the laws of some other countries.

In Scotland our English rule has never been accepted. Erskine says in his "Principles of the Law of Scotland": "This servitude cannot be constituted by prescription alone, for though a proprietor should have built his house ever so low, or should not have built at all for forty

years together, he is presumed to have done so for his own convenience and profit, and therefore cannot be barred from afterwards building a house on his property or raising it to what height he pleases unless he be tied down by his own consent." Another writer says "The theory in Scots law is that a proprietor is only bound to provide light for his own property, and any open space he may have is not to be reckoned on by his neighbour."

In Ireland also a man had to provide his own light as well for his land. The Irish law, however, is now assimilated to our own by Lord Carew's Act in 1838.

In the U.S.A. in 1837, shortly after the Prescription Act was passed, an American judge—Judge Bronson—expresses himself thus: "There is, I think, no principle upon which the modern English doctrine on the subject of lights can be supported. It is an anomaly in the law, since the English doctrine of ancient lights has been repudiated in our courts. It cannot be applied in the growing cities and villages of this country without working most mischievous

Hence, we see another example of the isolation of our beloved country. Is there not only one remedy—legislation? I would suggest an enactment providing that no further rights of light across another's land should be acquired, and that existing rights should be extinguished (1) as to freehold, at the end of fifty years; (2) as to leasehold, at the expiration of fifty years, or the existing term, whichever period should be the shorter.

This would entail no hardship on anyone, would do an injustice to no one. The man who had built would still have all that he paid for, his land and the materials on it, and the owner of adjacent land would enjoy his own in his own way without being jeopardised by the operations of his neighbour. I can conceive some objection to this in the case of abnormally high buildings, but this might be easily provided for by giving the owner of an adjoining building over, say, 50ft. high, a right—which indeed I think he would have without special provision, under the maxim, *sic utere tuo ut alienum no laedas*—to compensation, not for obstruction to his light

per se, but for any general damage that might be actually proved in each case by appropriate evidence, as in suits to abate a nuisance.

At the foregoing meeting it was resolved to refer to the Council of the Society to take action for promoting some legislation to amend the existing law of ancient lights. Messrs. G. E. S. Streetfield (London, W.) and G. Ratcliffe (Norfolk) were elected members of the Society, and Mr. F. B. Holt (Warwick) was elected a student.

Views and Reviews.

The Use of Cement.

This is a very useful little book for cement users and buyers, containing an immense amount of information in a small compass. Some such note-book, small enough to go comfortably in the pocket, has been needed for many years. It is written in easy language, understandable by all. The book is divided into four sections. Section I. gives a short abstract of the history of cement-making and a description of the processes of manufacture, with a number of methods of testing. Section II. deals with the use of cement, what materials may or may not be employed with it, and hints as to methods of using it for different purposes, with proportions. Section III. explains how, when and where to buy cement. Section IV. gives a directory of cement-makers and a list of representative towns, and provides means for determining which firms are the most likely to be the cheapest to obtain cement from for any particular destination. As the author says: "Practically all the cement-makers in this country now make their cement on scientific lines; and it is so easy and cheap to test, or to have tested, any cement—the result of

such tests being absolutely reliable—that it is much better to buy on the test than on the brand." This gives clearly the need for knowledge of how to test and use cement, and for the general reader we cannot recommend a better book. It is admirably printed and got up, as all Messrs. E. & F. N. Spon's books are, being bound in thin leather, with gilt edges.

"Cement Users' and Buyers' Guide," by Calcare. London: E. & F. N. Spon, Ltd., 125, Strand, price 2s. 6d. nett.

Public Library at Milwaukee, Wisconsin, U.S.A.—An illustration of the reference-room in this library was published in *THE BUILDERS' JOURNAL* for September 18th, 1901. The building is referred to in the paper on the planning of American libraries read at the last meeting of the Royal Institute of British Architects and reported on p. 74 of our last issue, which paper is published in full, with plans, in the issue of the "Institute Journal" for March 22nd.

FIREPLACE IN BOARD ROOM, MILWAUKEE PUBLIC LIBRARY, U.S.A.
FERRY AND CLAS, ARCHITECTS.

consequences. It has never, I think, been deemed part of our law." And he then refers to Kent's Commentaries. "In 1893 the New York Court of Appeal held that an owner of property may place his windows overlooking his neighbour's premises, but the neighbour may build to the extremity of his land, nevertheless."

In France it is provided that a man may not have a straight view, or a window for sight, or balconies or other projections on his neighbour's estate unless there is a distance of 19 decimetres between the wall on which they are made and the said estate; nor a side or oblique view on the same estate, unless there is a distance of 6 decimetres. The Italian code is similar, but the distances are slightly less. Lower Canada maintains the French rule. In Sweden a man must not construct windows nearer than 7ft. 9in. to his neighbour's land.

So you see in none of these countries can a man rely on his neighbour for his light, but must make suitable provision for himself.

* Summary of a paper read before the Society of Architects on March 20th, 1902.

IDEAL PLUMBING.—III.

By G. A. ALLAN, Plumbing Instructor, Trades Training School.

(Continued from p. 42, No. 369.)

THE most important fitting in connection with sanitary drainage is undoubtedly the water-closet. The only patterns that should be allowed on any jobs are the wash-down (Fig. 14), the valve (Fig. 15) and the syphonic (Fig. 16); and of these only the best makes are permissible. Plug valves, plunger closets, wash-outs, long and short hoppers, and cottage pans should be classed with the much-condemned pan-closet and rigorously excluded from all sanitary work; while latrines, trough-closets and similar fixtures would never be allowed by any self-respecting architect, nor fixed by any sanitary engineer who valued his reputation. Valve and syphonic closets require a trap to be fixed under the floor. The soil-pipe can be tested for soundness before the closets are fixed by stopping the inlets to the traps; P-traps should always be used for these closets. When they are connected to the soil-pipe the branch of the latter and the trap are fixed between the floor of the closet and the ceiling of the room or passage below; therefore, the P-trap is necessary. When connected directly to the drain, the trap being underground, a P-trap should also be used, the out-go being turned towards its junction with the drain. Wash-down closets, when connected to the soil-pipe, should have P-traps, as all the joints are thus kept above the floor, where they can be seen, until the pipe passes through the wall to the open air. Wash-down closets connected directly to the drain usually have S-traps, as it is necessary to lead the out-go underground at once. Wash-down closets should be of the pedestal form, having the pan and trap made in one piece. They should be fixed before the soil-pipe is tested, so as to ensure the soundness of the connection between the trap and the soil-pipe. This joint can be seen and examined, but every joint that has drain-air inside it should be tested.

I attended a "demonstration to students" at the Parkes Museum of Hygiene one evening, and went directly afterwards to a lecture on plumbing. Curiously enough, the subject of both lectures was "Water-closets." The first demonstrated the superiority of the wash-down closet over all other types, especially over the valve closet. Its simplicity, the absence of complicated machinery and hidden parts, its cleanliness, compactness and safety were all duly dwelt upon. Special emphasis was laid on the fact that the necessary flushing cistern prevented the domestic water-supply from having any direct connection with the closet-pan. It was also pointed out that by turning back the seat the wash-down closet was equally available for use as a urinal or a slop sink, and that as it was unusual to fit up a mahogany casing round it there was not the customary harbour for dirt.

The second lecturer was equally dogmatic and equally conclusive in his demonstration of the absolute superiority of the valve closet over every other form, especially over the wash-down. The valve closet holds a body of water that prevents the pan from being fouled in the using, and which receives and at once deodorises the faeces. When the handle is lifted the sudden release of such a large body of water effectively flushes the soil-pipe and drain. The wash-down, on the other hand, is supplied with a flush that is conveyed by a 1½ in. or 1½ in. pipe, and the contents of the pan are carried away with what is a comparative dribble, quite useless as regards flushing the soil-pipe or drain. The lecturer also drew attention to the fact that the complicated machinery complained of in the valve closet is not absent from the wash-down, but has been transferred to the flushing apparatus, many of which are most intricate and require frequent and skilled attention. He therefore disputed the claim of the advocates of the wash-down that it is simple. He pointed out that in the valve closet the hidden parts beneath the valve are all reduced in size to a minimum and are all protected and thoroughly flushed. He enlarged on the silence of the valve closet in use as compared with the noise of the flushing cistern of the wash-down; and finally he pointed

out that the valve closet could be removed for repairs without danger, because when the closet apparatus was taken away there was still a sealed trap below the floor.

This is a fair summary of the respective merits and demerits of these closets. But neither lecturer mentioned that when the valve of a valve closet is out of order the pan contains no water, and so must either remain out of use or become very foul from being improperly used.

In 1888, when I first worked in the United States, syphonic closets were fixed as the best closets in all good houses and first-class hotels. Nearly five years afterwards they were brought forward in England as something new. They hold a large body of water in the pan, like the valve closet, but that is the only point in their favour over the wash-down.

Valve closets are undoubtedly the best in positions where the noise of the flushing cistern would be objectionable, and where they will be treated with great care; also where there are other closets which can be used when one gets out of order. Care should also be taken to obtain the best quality of apparatus from a trustworthy maker. The trap should be of cast-iron and glass-lined, as recommended for

or any ignorant person ever driving a nail into the floor for any reason, is liable to drive it into the upper side of the lead branch or trap. A nail driven into the underside would not be so serious, because the leakage of water would indicate that something was wrong. But a nail driven into the upper side allows a leakage of drain-air with nothing to indicate the danger until a test is made.

For general purposes a good wash-down pedestal water-closet is far ahead of any other. In country districts, where the best skilled labour is not always readily available for repairs, it is the only closet apparatus that should be fixed. The only valid objections to the wash-down closet are the noise of the flushing and the smallness of the water area in the pan. The noise is much less in some than in others, and one making the least noise can be chosen. The position of the water-closet can also be arranged so as to isolate it from the living and sleeping rooms as much as possible. If this cannot be done altogether, a valve closet must be used. The area of water-surface also varies in different makes, and one with a large water-surface should be selected. Care must be taken that the water-surface is not too large, or the con-

FIG. 14

FIG. 15

FIG. 16

the soil-pipe, and it should be provided with a flange to come flush with the floor and have bolt-holes to correspond with the holes in the closet flange. The joint between the trap and the closet apparatus should be made with red-lead putty and securely bolted. The closet-pan should be made with flushing rim and overflow arm, the overflow being trapped and connected to the valve-box. Provision should be made for recharging the overflow trap each time the closet is flushed. The overflow must be connected to the valve-box behind the closet valve when the latter is lowered, and it is thus protected against any of the contents of the pan being washed into it when the closet is discharged. The valve-box should be ventilated to the open air by two 1 in. pipes, one of which may be connected to the crown of the overflow trap, so as to act also as an anti-syphonage pipe to this trap.

Of syphonic closets there are several good makes, any of which would prove satisfactory. As a matter of fact, syphonic closets have not yet become subject to cutting prices, and therefore the temptation to scamp them has not been felt.

For the syphonic as for the valve closet the trap under the floor should be of glass-lined London County Council standard cast-iron. No lead soil-pipe should be used on good work, especially inside a building. A careless or malicious carpenter putting down floor boards,

tents of the trap may not be driven out at each flush. The seal of the trap in a pedestal closet should not be more than 1½ in. That is quite deep enough for safety, and when it is much deeper there is considerable trouble in getting all matters carried through the trap at each flush.

The closet-pan should be of white glazed stoneware, not of glazed fireclay. It is often recommended that the pedestal be quite without ornamentation, as an embossed pattern only collects the dust and coloured ornamentation hides the dirt; but in good houses, clubs, &c., they are sure to be cleaned properly, and therefore the arguments as to dirt do not so readily apply. In schools, hospitals, city offices and public institutions, however, the closet-pans should be plain. It would be well if the makers of water-closets would bear in mind the purpose for which they are used; we should then be spared some of the intricate but totally inappropriate designs now on the market.

Of flushing cisterns there seems to be an infinite variety. Only those having a syphon action, started by a pull of the chain or "pull and let-go," should be used. People do not have time in this age to hold on to a chain until the flushing tank is emptied. The waste-preventing variety is best, as any defect of the ball valve is seen by the issuing of water from the overflow pipe, instead of it trickling down the closet-pan from the flushing pipe, as in non-waste

preventors. Flushing cisterns should be made of wood and lined with tinned copper, as they are then much less likely to suffer from frost than those made of cast-iron. In all better class work in America the flushing cisterns are made of hardwood to match the closet seats.

A further advantage of a wash-down closet is that by turning back the seat it can be used as a slop sink or urinal. Urinals should never be fixed in private houses, as a wash-down closet is as effective and much less likely to become offensive. When urinals are fixed in a building, a semi-cylindrical shield of glazed earthenware should be used such as is now generally adopted in underground conveniences. Each stall should have a separate trap connected to the outgo and leading to the soil-pipe or drain. Each trap should be separately ventilated. All the ventilation-pipes can be gathered into one of sufficient size and this carried up like the soil ventilation-pipes. In a recently-published book it is recommended that urinals should discharge into surface traps in the open air. This is wrong; and in London the new drainage by-laws passed last year forbid it. Some of the most troublesome complaints I had to deal with as a sanitary inspector were caused by stale urine standing in gulleys, the foul smells from which were blown into open windows in hot weather.

In large houses, hotels, boarding schools, hospitals and institutions it is useful to have a slop sink on each floor. They are useful for emptying bedroom slops, water used for washing floors, paint-work, &c. They are best when furnished with a flushing rim and with a gun-metal hinged grating that can be laid across and on which pails, cans and pitchers can stand whilst being filled from the hot or cold water taps placed above them. A syphonic flushing cistern should be provided and the sink should be flushed each time that anything has been emptied into it; otherwise the foul liquids adhering to the inside surface of the sinks and standing in the traps are liable to cause annoyance. The waste pipes from slop sinks should be connected to the soil-pipe and be trapped and ventilated like those of water-closets.

Water-closets, slop sinks and urinals are the only fixtures that it is customary in England to connect directly to the soil-pipe or drain. The waste pipes from baths, lavatory basins and sinks (other than slop sinks) are disconnected at the foot and caused to discharge over a properly-trapped gully, or into a gully under the grating but above the water line, or over an open channel leading to a gully 18 in. distant. Rain-water pipes are treated as to disconnection in the same manner as bath wastes.

Waste pipes should be fixed as straight as possible. They should run from just over a gully at one end to above the roof for ventilation purposes at the other end. The waste pipes from fixtures should be branched in separately, i.e., the outlets from the fixtures should each be connected directly to the main waste pipe and not branched into each other. The waste pipe from each fixture should be trapped directly under the fixture, and every trap should be ventilated by an anti-syphonage pipe of the same internal diameter as the waste pipe to which the trap is connected, such anti-syphonage pipe to be carried up above the roof. It should not be connected to the waste pipe above the highest branch, and certainly should never be cut off flush with the face of the wall, as recommended in most text-books.

White glazed porcelain baths are the best. Plinished copper does not keep so clean, and enamelled iron is only clean so long as the enamelling remains unchipped; the unequal expansion and contraction of the iron and the enamel causes the latter to crack. Porcelain baths are better when provided with a flushing rim. The hot water entering through the rim warms the porcelain and so removes what is otherwise a serious objection to these baths. After use also, by turning on the water all scum left by the receding water is carried away. The waste pipe should be of 2 in. diameter, the outlet from the bath being 3½ in., protected by a grating. The old-fashioned plug and chain, against which so many objections have been raised, is still as good an arrangement as any that has been substituted for it. When an overflow pipe is necessary it should be run through the wall and cut off about 8 in. from the face of the wall and have a copper flap soldered on the end.

A shower bath, with needle spray, liver spray and douche attachments, should be fixed in the bathroom, enclosed in a marble stall and fitted with hardwood floor grating. The walls and floor of the bathroom should be tiled, the floor having a slight fall away from the door to the foot of the bath, under which should be a trapped waste pipe protected by a grating. Any water spilled on to the floor will then run off. The room also can be washed out with a mop and a hose-pipe attached to one of the taps. When the walls and floor are tiled as recommended the overflow pipe from the bath is omitted, as an overflow of water could do no harm.

Water-closet apartments and sculleries should have tiled floors and be tiled on the walls up to about 4 ft. high, the floors being drained as recommended for bathrooms. When the floors are not tiled and drained, lead safes about 3 in. deep should be fixed under baths, water-closets and lavatory basins, fitted with waste pipes cut off like overflow pipes about 8 in. from the face of the wall, and having a copper flap on the end to keep out the wind.

Of lavatory basins the tip-up variety should never be used under any circumstances, the inside of the containers and the underside of the basins being large surfaces on which the splashing of soapy water will dry and decompose. It does not yet appear to have come to the knowledge of sanitary authorities, elected and self-elected, that foul waste pipes from baths and lavatories can give off smells as offensive as were ever given off from a sewer. Whether the smells are as detrimental to health is a medical question with which medical men do not appear to have troubled themselves.

The chain and plug arrangement is not so desirable for basins as for baths. The best waste is a hollow plug standing in a recess in the basin and acting also as an overflow. By having this form of combined plug and overflow, and by keeping the trap on the waste pipe close up to the outlet of the basin, there are no parts inaccessible for cleaning. Hidden parts which are open to the atmosphere of the room, but beyond the reach of the scrubbing brush, should be rigorously excluded from all good plumbing-work. The lavatory basin, like the bath, is best when supplied by a flushing rim.

Scullery sinks should be of white glazed stoneware. Glazed fireclay is often recommended, and is used in making both sinks and pedestal closets, but it is very inferior to stoneware. When the glazing of a fireclay sink gets chipped the material of the sink absorbs water like a sponge and becomes impregnated with grease and filth. Stoneware is practically non-absorbent. A plug and overflow, as recommended for the lavatory basin, is best, on account of cleanliness.

In the butler's pantry the sink should be of tinned copper, as being less likely to cause breakages than earthenware, and as being cleaner and more durable under changes of temperature than lead. The plug and overflow should again be as for the lavatory basin.

The scullery sink waste should discharge into a deep-seal gully with large water-surface. A flushing tank with 3 in. flushing pipe should also discharge into the same, as shown (Fig. 17), to break up the grease after it has congealed and drive it down the drain.

(To be continued.)

A Statue of Queen Victoria at Portsmouth is proposed to be erected. The figure is to be in bronze, 11 ft. in height, and is to be placed on a massive pedestal of Aberdeen granite. The work has been entrusted to Mr. A. Drury, A.R.A., and the statue is to be ready for unveiling at the end of September or early in October.

A New Isolation Hospital at Rhondda has been erected. The building, which is on the most modern lines, is situated at the junction of Penrhys Road and Hospital Road, Ystrad Rhondda. The hospital is composed of seven blocks of buildings, namely, the administrative block, scarlet fever pavilions, typhoid pavilions, laundry and disinfecting block, mortuary, discharging block and stable. The whole structure is of local stone, surrounded by a wall, and within the enclosure is ample room for extension of the hospital. Accommodation is provided for thirty-two patients. The cost amounted to £13,385. The plans were prepared by Mr. W. D. Morgan, architect, Ton, who was successful amongst ten competing architects.

THE USE OF BRICK IN NEW YORK.

SPECIFICATIONS for new buildings in New York include more brick than formerly. Nearly all the new sky-scrapers have a larger proportion of brick than before, and the new apartment houses and dwellings are principally of brick. A recent trip around the city has shown that nearly all the new buildings now in process of construction are being mostly built of brick. Some are red, some are buff, some are white, but, whatever the colour, they are brick, and therefore indicate that in the near future some of the surplus, which has proved so troublesome hitherto, will be utilized. It is noticeable, too, that much pressed brick is being used for trimmings on the smaller buildings. Contractors are putting it in place instead of stone.

Builders of sky-scrapers got a lesson about a year ago, when the Home Life Building on Lower Broadway burned. Fourteen storeys high, it caught in the upper floors, and, because of the practical impossibility of forcing water to that height, it burned down slowly until the fire got sufficiently low that it could be fought successfully, when it was extinguished. The front of the building is of white marble, and every particle of it had to be taken down as low as the fire reached, which was to the seventh or eighth storey. It was cracked and warped so that the building inspectors pronounced it unsafe, ordered the erection of a protecting platform immediately, and closed that side of the street to travel until the dangerous material was removed.

The fire was not the hottest on that side. The building which burned entirely down was a low store on another side. The fire was fierce there. That side of the big office building was of brick, and it not only withstood the heat, but was found to be so good that not a brick was ordered to be removed, and the wall stands to-day just as it stood before the fire. The big steel girders on that side were bedded in the brick and did not heat enough to buckle at all. They remain to-day just as originally placed.

It does not require a very elaborate argument to show which material was the better there. And whenever the test has come brick has never failed, while stone has never stood. The truth of the matter is it cannot stand. Its very composition precludes that possibility. Hot water will cause it to explode if it is hot, and cold water will cause it to crumble like broken glass. Why, then, build of it? Why use it in buildings which may be subjected to intense heat? Simply because the merits of brick for such work are not convincingly demonstrated to builders or owners about to build.

One of the wealthiest banks in New York is about to build a bank structure for its own use. The new building is to be on Pine Street, in the very heart of the financial district, but, instead of erecting a great office building, the bank will put up a four-storey structure and occupy all the floors. And it is to be largely of brick. There may be some stone trimmings around the windows and doors, but apart from that it will be of brick throughout. The intention is to make it fireproof, and the brick construction is thought to meet the requirements more effectually than stone.

In several ways this building is a radical departure from the usual method of building in New York. In the first place it is not to be a sky-scraper. The bankers think it is better to occupy their own building alone than it is to pile up a large number of storeys above what they want for their own use, with the prospect of losing money in the end. Sky-scrapers are not always profit-bringers. Some of them are very large "white elephants," which the present owners would sell at a low figure to save themselves from feeding them any longer.

The next important difference is the open recognition of brick as a superior fireproofing material. Formerly the wealthier builders have used brick in the rear or the sides, where it comes in contact with other buildings, but it has not been put prominently in front as a means for reducing fire risk. And yet a moment's consideration should be sufficient to convince any intelligent man that brick is in every way safer than stone. The very fact that brick is fired in

a kiln where the heat is sufficient to make it white is enough to show that it would stand fire where porous stone, which had never been fired, would not.

Firemen dread a fire in a stone building. As soon as the stone gets hot and cold water is thrown upon it, as is always the case, there are dangerous fissures formed or serious explosions occur. Not in the sense that the explosions themselves cause loss of life directly, but they weaken the walls so that they will not stand. Every fireman understands perfectly the risk he runs in going on the roof of a stone building. An explosion in a wall may send the entire roof into the cellar without a moment's warning. Steel will not stand heat and water, but brick will. It cannot be melted and it cannot be buckled. If steel girders are encased in brick there is very little danger that they will be injured.

The writer has examined a great number of burned buildings within the past few years, and has come to the conclusion, after making comparisons, that stone is not much safer than wood. So far as catching from the outside is concerned, unless the fire be very strong, there is no more danger than with brick. But if it does not catch it might just as well, because, if cold water touches it when it is hot, there is trouble. When brick is hot, under the same circumstances, it will give forth a cloud of steam when wet, but there is nothing else to show that it has been touched. The walls stand intact, and generally are not dangerous to work on afterwards.

If the question of expense be worthy of consideration, brick would certainly be more attractive than stone. It requires less work to transport it, less to handle it, and less to put it in place in the building. Under modern methods of working a brick building will go up almost as rapidly as one of wood. The relative expense of building is not much more. The first cost of the material is more, but it lasts longer with less attention, which compensates for first extra cost.

Within the past four years brick has been gradually working its way into New York. There is a new apartment house near Broadway and Thirtieth Street which is built entirely of brick. It is warranted fireproof, and it comes as near to it as any structure in the city. To make doubly sure that there would be no rush of fire up the elevator shaft, the well was built outside the building, and is of brick. No fire could possibly catch from the outside, and, if it started inside, the draught would not draw the flames up through the middle of the building. It is the most modern in its appointments, and certainly the safest from fire.

Brickmakers should point to that structure as being in every way the best for the purpose in the city. They should show to intending builders that brick is, of all material, the best adapted to the purpose because it guarantees safety.—(Extracts from an article in the "Clay-worker" of Indianapolis, U.S.A.)

Surveying and Sanitary Notes.

Royal Warranty.—Messrs. Thomas Crapper & Co., of Marlborough Road, Chelsea, are again the recipients of royal favour, having been appointed sanitary engineers to His Royal Highness the Prince of Wales. They already hold a similar appointment to the King.

Proposed Widening of Leadenhall Street.—The Corporation are contemplating widening the Aldgate end of Leadenhall Street, which at present is much too narrow for the increasing traffic. The London County Council have been asked to contribute half the cost, as the Corporation contend that the improvement will be of benefit to the whole metropolis. The County Council have suggested that the Corporation should do portions of the work as opportunity offers when leases fall in or when premises are being rebuilt. The Corporation at present are not in favour of adopting that course. The improvement would cost between £600,000 and £700,000.

Engineering Notes.

The Uses of Engineering Models.—A paper on "The Uses of Engineering Models" was recently read before the Institution of Junior Engineers by Mr. Percival Marshall, A.I.M.E. After pointing out the historical value of models as a record of engineering progress, the author suggested that present-day firms would confer a valuable benefit on engineering posterity if they would make a point of presenting to the national collection at South Kensington a scale working model of all important novelties in engineering construction which they might introduce. The author dealt with the scientific and commercial uses of models, and then passed on to their important use in connection with educational work. He advocated the construction of simple well-designed model engines in technical school workshops in preference to work of a heavier character, expressing his opinion that the average student would learn more about the construction and working of an engine by making a complete model himself than by making one or two parts only of a large engine, and, moreover, would take a far greater interest in doing something which would be entirely his own work when finished.

A New Bridge over the Tyne.—The North-Eastern Railway Company have given the contract for the building of a new high-level bridge over the River Tyne at Newcastle to the Cleveland Bridge and Engineering Co., Ltd., of Darlington. The present high-level bridge, connecting Newcastle and Gateshead by road and railway, was opened in 1849, having been designed by the late Robert Stephenson. The total cost of the bridge, including land and approaches, was £491,000; and during the half century that has since elapsed the bridge has served the traffic of the railway company for a l purposes south of Newcastle. For some years past, however, considerable delays have arisen because of the restricted means of reaching the city from the south, and recently the North-Eastern Railway Company resolved in order to relieve the traffic to erect a new bridge over the river a few hundred yards west of the existing bridge. The planning of so important a work has necessarily involved a large amount of labour. In point of size and cost this will be the largest bridge contract which has been given in the United Kingdom since the completion of the Forth Bridge. The estimate of the engineer (Mr. Charles A. Harrison) of the cost was £470,000, but the contract is for rather less than that sum. The contract comprises a railway of four lines of road, beginning at a junction with the Newcastle and Carlisle Railway west of Newcastle and terminating by a junction on the main line east of the new bridge on the Gateshead side, being a length of over half a mile of viaduct. Besides, there is included a connecting loop railway of two lines of road, beginning at a junction with the railway at the south end of the bridge and joining the main line again to the west of Gateshead Station, this second railway forming a viaduct about 80 ft. in length.

The Simplon Tunnel.—The contractors for the Simplon Tunnel are at last in a position to publish returns of the progress made and to forecast the rate of advance for the future. Work has been going on steadily on the Swiss side, but on the Italian side great difficulties have had to be overcome. For some time a great rush of water impeded operations, and as soon as this difficulty was neutralised a sort of landslide composed of broken rock and earth had to be dealt with. The pressure of this landslide was so great that it repeatedly broke wooden shores 20 in. in diameter, and it became necessary to dismount three times in succession the machinery for boring. At last it was found possible to hold in the sliding mass by means of metal blocks, and before long it will be possible for the service locomotive and trucks to pass up to the boring point. The time lost in overcoming these difficulties was thought by outsiders to be disastrous to the contractors; but their calculations, based on the minimum rate of boring, allow them six months' margin, and the distance which has been lost by the delay corresponds to little more than a month of boring at the average rate. The tunnel must

be ready on the 13th of May, 1904. The programme of the contractors was to have finished the whole 19.73 kilometres at the end of 1903. The proportion which, according to this plan, ought to have been bored at the present moment is 11.6 kilometres. The distance actually bored is 11.15 kilometres. There remain about 8.6 kilometres to bore during the next two years. To do this it will be necessary to complete 11.8 metres a day, or 5.90 metres at each end of the tunnel. Since the average rate of boring has been about seven metres a day at each end, or fourteen metres a day altogether, the contractors expect, in the absence of obstacles more serious than those yet encountered, to finish their work well before the appointed time.

THE GREAT DAM AT ASSUAN.

THE correspondent of the "Times" says that, now the dam across the Nile near Assuan is approaching completion, attention naturally turns to the sluices which have rendered this great work possible—those invented by the late Mr. F. G. M. Stoney. The principle involved consists in substituting for the usual sliding action of the sluice face against its fixed frame a rolling action—that is to say, a number of rollers are placed between the fixed and moving faces, which have the effect of so greatly reducing the friction that it is possible to construct sluices of almost any size and to stand almost any head of water, and yet to be easily operated by hand-power. The half-tide sluices across the Thames at Richmond and those on the Clyde at Glasgow are perhaps the most notable examples of such sluices. In the latter case the sluices are 80 ft. wide and 12 ft. deep, and yet they can be worked by two men. When the construction of the masonry of the dam was entrusted to Messrs. John Aird & Co. a contract was also entered into by the Egyptian Government with Messrs. Ransomes & Rapier, Ltd., to supply the sluices and lock gates for the project, owing to their great experience as makers of the "Stoney" sluice.

The sluices are made at Ipswich, where they are all put together and tested before despatch to Assuan. There are in all 180 sluices, each 6 ft. 6 in. wide, giving a combined water-way of nearly 1,134 ft. One hundred and forty of the sluices are 23 ft. deep, the remainder being 11 ft. 6 in. They are built in the dam to close culverts at various levels to suit the bed of the river. Those at the lowest level (of which there are sixty-five) have to work against a 6 ft. head of water, which represents a pressure of 210 tons against a sluice. Notwithstanding this, however, it is arranged that one man can work them, so as to regulate the water passing from the reservoir. A large number of the sluices are already in position in the dam, and others are being erected as quickly as the progress of the masonry will permit Messrs. Ransomes & Rapier's resident engineer to proceed. In consequence of the rapid manner in which the two contracts have been carried out, the dam and sluices will be finished by the end of next June, and thus enable the Egyptian Government to take advantage of the end of this year's flood to fill the reservoir and have a supplementary supply ready for next summer's crops, instead of having to wait for the following year, as provided by the contract. Messrs. Ransomes & Rapier, Ltd., are also supplying and are now erecting the five lock gates. These gates are of unique design, the two upper ones being the largest single-leaf gates in the world. They will be worked by hydraulic power generated by a turbine placed in the dam, and are constructed to stand a pressure of over 1,740 tons. Each gate is suspended from a carriage which travels upon bascule girders so as to run the gate back into a recess in the side of the lock, the bascules being then raised so as to permit masts to pass them. The gates are each 32 ft. wide and are respectively 59 ft., 59 ft., 46 ft., 36 ft. and 26 ft. deep. Sir Benjamin Baker, who is acting as consulting engineer to the Egyptian Government, has just returned from a visit of inspection to Assuan and is much pleased with the progress and character of the work. It is believed that the official opening will take place early next year.

Keystones.

The Industrial Freedom League has just been formed. Its offices are at 53, Parliament Street, S.W.

Marble Busts of Ruskin and Browning have been placed in the large hall of the South London Art Gallery, Peckham Road. They were presented by Mr. Passmore Edwards.

Westminster Cathedral Bells.—The enormous tower of the Westminster Cathedral is intended for bells, but it is asserted that from the topmost storey the sound will hardly sink to human levels.

Liverpool Cathedral Controversy.—As a counter-blast to the letter referred to on p. 73 of our last issue, Mr. F. M. Radcliffe says he entertains no doubt whatever that the further money necessary to build on St. James's Mount "a cathedral not unworthy—if architectural skill be forthcoming—to rank as a representative of its age in the great series of English cathedrals" will be cheerfully and liberally contributed.

A New Technical Institute at Cleethorpes has been erected at the top of Isaac's Hill. On the ground floor are a classroom, wood-carving room, clay-modelling room and a chemical laboratory. On the first floor are an art-room, another chemical laboratory and a lecture theatre. The building, which has cost about £2,100, was designed by Mr. F. W. Croft, architect, the builder being Mr. W. Ion; both of Grimsby.

In the Roman Catholic Cathedral in Portsmouth on the left side of the high altar there is now approaching completion a beautiful chapel to the memory of the late Bishop Virtue, who died in May, 1900, and was the first Roman Catholic Bishop of Portsmouth. Above an altar of onyx and marble is a stained window containing the portrait of the late Bishop, and the walls are decorated with paintings of the English saints, executed by Mr. Westlake, of London, who is still at work upon them. The roof is richly decorated, and the entire chapel is a very rich piece of work.

The Birkenhead Institute has been extended by additions which complete the façade to Whetstone Lane, comprising an entrance-hall with cloak-room accommodation, &c., and classroom on the ground floor. The first floor is an extension of the science department, in the shape of a physical laboratory, with small workshop and dark-room attached. The façade to Whetstone Lane is of white Storeton stone, "scutch faced," with dressed quoins and moulded window jambs, &c. The architects are Messrs. T. Mellard Reade & Son, of Liverpool. The contractor for the present additions is Mr. Charles Burt, of Liverpool.

A Smethwick Competition.—The Smethwick Town Council last week considered the report of the Watch Committee on the competitive designs for the proposed new police buildings to be erected in Halford Street. Four sets of plans were received, and the Committee recommended that those of Mr. J. P. Osborne (to cost £12,656) be accepted. An amendment to accept the plans of Messrs. Wood & Kendrick (£9,000 or £10,000) was defeated, but a motion to refer the plans back to the Committee was carried by the casting vote of the Mayor, and three members of the Committee said they would resign.

Glasgow Technical College Architectural Craftsmen's Society.—On Friday last Mr. James McLeod read a paper on "Prevention of Damp in Walls," Mr. Alexander Davie, I.M., occupying the chair.—A visit took place on Saturday afternoon following to the "Stevenson Memorial Church," of which Mr. J. J. Stevenson, F.R.I.B.A., London, is the architect, and which was recently opened. This church is a handsome Gothic edifice in a Scottish treatment, situated at Belmont Bridge, overlooking the River Kelvin. The interior shows an effective use of white pine finishing. The party was courteously conducted over the building by Mr. George Calvert, clerk of works.—A sketching party of the Society intend visiting Birmingham, Worcester and Lichfield at Easter, under the guidance of Mr. James McKissack, architect.

The Statue of the Queen at Calcutta by Mr. George Frampton, A.R.A., was unveiled last Wednesday. It is hoped that it will presently adorn the Memorial Hall.

Mr. Cadwallader Bates, of Langley Castle, Northumberland, a well-known antiquary, who wrote a history of the county and a history of the Mediæval Border Towers, died recently.

The Affairs of H. W. Roberts, architect, of Newmarket, were considered at a public examination held at the Cambridge Bankruptcy Court last week. The examination was closed.

In the David Lewis Northern Hospital, Liverpool, which was recently opened by H.R.H. Princess Louise, the locks, fanlight gearings and fittings throughout were supplied by Messrs. Colledge & Bridgen, of Wolverhampton.

Institute W. Schimmelpfeng.—The annual report of this Institute contains various items of interest to those who appreciate the importance of organised mercantile reporting, especially in view of the critical state of trade abroad during the past year. A branch office is to be opened in Manchester for the reporting service on traders in that city and its suburbs. The London office is at 137, Cheapside, E.C.

The Surrey Archaeological Society held its annual meeting at Guildford recently. The report alluded to the satisfactory results which had attended the excavations at Waverley Abbey, Farnham. During the year the foundations of the pulpitum, or portions belonging to the monks' stalls, were discovered, as well as the foundations of the lay brothers' infirmary hall, measuring roughly 94ft. by 41ft., with the bases of the pillars of the north and south arcades *in situ* and for the most part in excellent condition.

Mr. F. M. Gardner, formerly in partnership with the late Mr. E. W. Fry, surveyor and architect, of Dover, has recently been appointed assistant municipal building surveyor by the Town Council of Johannesburg, he having previously held an appointment on the civil staff of the Royal Engineers at Cape Town. During the time of his partnership with Mr. Fry in Dover, the main thoroughfare was rebuilt, and Mr. Gardner had a principal hand in preparing the plans and designs for the new frontages which are the leading features of modern Dover.

Back Numbers of "Specification" Wanted.—A number of subscribers to "Specification No. 5" have expressed a wish to purchase the previous four numbers. Numbers 1, 2 and 4 have, however, been out of print for some time. We are now willing to exchange a copy of No. 5 for the two numbers 1 and 2, and similarly a copy of No. 5 in exchange for No. 4. If any readers who desire this exchange will send their copies, carriage paid, addressed to the Publisher of "Specification," Effingham House, Arundel Street, Strand, London, a current number will be forwarded by return.

The Manchester Society of Architects held its last meeting of the winter session on March 13th. The president, Mr. Alfred Darbyshire, presented the prizes to the successful students, after which Mr. Isaac Taylor gave a criticism on the work submitted. The drawings sent in for the various competitions were over fifty in number and were hung round the room. The winners for the design for a gatehouse—the February subject in the class of design—were: Senior class, Mr. J. T. W. Brooke; junior class, Mr. G. F. Ely. The winner of Mr. Holden's prize for an art gallery was Mr. P. A. Horrocks. Special second prizes for the gatehouse were also awarded to Mr. C. Peterson and Mr. Harold Hill.

Baldersby Hall, a fine mansion near Ripon, the late seat of Viscount Downe, has been partially destroyed by fire. The mansion has only recently passed into the possession of Mr. J. Brennan, of Manchester, being in the hands of workmen fitting electric light and heating apparatus. Notwithstanding that the north-west wing, the servants' department and the stables were saved, the damage amounted to several thousand pounds. The whole of the large south-west wing, including the entrance hall, dining-room and other apartments, was gutted, and it was only with the greatest difficulty that the north-west wing was saved. Most of the valuable furniture, which was in the hall, was hastily removed into the park.

The Cretan Explorations.—Mr. Arthur Evans reports in regard to his further excavation of the palace at Knossos:—Progress has been slow but satisfactory. South of the hall of the double-axes important rooms are opening out. One of these, apparently containing another "bath" and parapet, shows a high dado of fine gypsum slabs with a fresco frieze—spiral pattern—still partly in position above it. In the adjoining room also a good deal of fresco has been found, quite an aquarium of fish, and the upper part of a good female figure. A very interesting magazine has come to light—closed since the earliest palace period—containing vases of the Kamares class, some with beautiful lily designs in white; and another very remarkable find is a kind of domestic shrine at the end of a room with a small painted female image in position.

New Patents.

These patents are open to opposition until April 26th.

1901.—Travelling Cranes for Machine Shops, Factories, &c.—4,865. A. J. BOULT, 111, Hatton Garden, London, W.C. (communicated by The Chisholm & Moore Manufacturing Co., Cleveland, Ohio, U.S.A.). The driving motor and hoisting drums on the crane, which travels on the usual guideways at each side of the building, are operated by compressed air, the feed pipes being connected with a central sets of taps in the shop so that the different movements can be easily controlled.

Pipe Joints.—5,617. P. O. FELL, 43, Earham Road, Norwich. The socket end of the pipe tapers inwards and the spigot end has an inclined projecting lug, the space between the two being filled with the cementing material. By these means the two ends are prevented from being drawn apart, and there is no risk of the cement exuding into the pipe.

Lavatory Basins.—7,594. W. OATES, Horley Green Works, Halifax. In order to provide a fresh supply of water for each person using the basin, the tap has a rose end so placed that the water is sprayed over the whole of the basin. A non-closable waste pipe is provided. The fitting is specially intended for public schools and similar institutions.

Rotary Kilns for Cement, &c.—9,369. H. H. LAKE, 45, Southampton Buildings, London, W.C. (communicated by Fellner & Ziegler, Kreuznacherstrasse, Bockenheim, Frankfurt-on-the-Main). A nozzle is provided for mixing coal-dust with air and the flat flame so produced is directed upwards on to the lowest portion of the kiln. It is claimed that better results are thus obtained than by using a flame directed somewhat downwards.

The following specifications were published on Thursday last, and are open to opposition until May 5th. A summary of the more important of them will be given next week. The name in italic is that of the communicator of the invention.

1901.—4,625, WILSON, constructing piers, walls, &c., and sinking shafts. 5,269, WRIGHT, chimney cowl. 5,311, MINDELSON, guard for circular saws. 6,065, BÜTTENBENDER, wallpaper trimming-machine. 6,115, BRODIE, constructing buildings for the poor. 6,183, LEWIS, pipe joints. 6,199, CLARE, metal and concrete walls, floors, &c. 6,570, TWYFORD, water-supply fittings for baths, lavatories, &c., in asylums. 6,888, PULLAN & MANN, brick-pressing machines. 17,041, HEENAN, furnaces for burning refuse. 7,340, RACKHAM, hydraulic rams. 7,835, PETERSON & JOHANSSON, elevators for letters. 8,138, HARRISON, HARRISON & HARRISON, draw-back locks and night latches. 8,364, HUMPHREY, pipe-joints. 13,273, ELLIOTT, raising and lowering windows. 16,105, WILKINSON, stocks and dies. 16,198, JORGENSEN, hot-water heating apparatus. 22,832, BORDEN, machines for cutting screw-threads. 23,231, LAKE (Curtis), taps. 24,818, FITLER, machine for cutting and shaping wood. 25,785, RICHARDS, DOUGHERTY, WILLIAMS & WILLIAMS, squib, for blasting purposes. 25,935, ELLIOTT, stencil-cutting machines. 26,606, ZIMMER, conveyors.

New Companies.

Coronation Pottery Co., Ltd.

Registered to carry on at Stoke-on-Trent the business of manufacturers of and dealers in earthenware, china, glass, potters' materials. Capital £1,000 in £1 shares. The directors are H. Peaks, L. Forester and W. P. Moreton.

European Electric Railways and Public Works Construction Co., Ltd.

Registered to carry on business as contractors for public or private works, as mechanical and civil engineers; to construct and maintain rail and tram roads, gas and electric works. Capital £21,000 in £1 shares.

House of Issue, Ltd.

Registered to buy, take on lease, or otherwise acquire timber estates and agricultural lands, rights to cut timber; as timber and lumber merchants, sawmill proprietors, &c. Capital £10,000 in £1 shares. Registered office: 39, New Broad Street, E.C.

Crossley & Sons, Ltd.

Registered to acquire the business of wholesale builders' factor and dealer in building materials, now and hitherto carried on at Boundary Road and Station Road, Middlesbrough, at Coatham, Redcar, and at Stockton-on-Tees, Durham. Capital £3,500 in £1 shares. The directors are J. Crossley, Alfred Crossley, Arthur Crossley, and C. E. Crossley.

Guaranty Incandescent Mantle Co., Ltd.

Registered to acquire the goodwill of the business of manufacturers, importers, and dealers in gas mantles, as carried on by J. Stein and E. Schultz, as the Guaranty Incandescent Mantle Company. Capital £5,000 in £1 shares (1,500 deferred). The directors are J. Keith, J. Stein, and E. Schultz. Registered office: 20, Eastcheap, E.C.

Plaissetty Mantle Syndicate, Ltd.

Registered to acquire from A. M. Plaissetty and E. Sepulchre improvements in the manufacture of incandescent filaments and mantles for the United Kingdom and colonies of Great Britain (excepting Canada); and to deal in and with mantles, filaments, threads, silk burners used in connection with incandescent lighting. Capital £10,000 in £1.

Bullgill Coal Co., Ltd.

Registered to acquire the business of the Bullgill Coal Company as carried on by J. McKelvie; and, generally, to carry on the business of colliery owners, ironmasters, lead smelters, lime, brick and coke manufacturers, &c. Capital £10,000 in £1 shares. The directors are J. McKelvie, J. S. Smith and W. Collie. Registered office: Bullgill, Maryport, Cumberland.

Armitage Barnard & Co., Ltd.

Registered to carry on the businesses of oil boilers, oil refiners, paint, colour and varnish manufacturers, importers and manufacturers of chemical, industrial, and other preparations, articles and compounds, anti-friction greases, anti-fouling compositions. Capital £5,000 in £1 shares. The directors are G. Chadwick, W. S. Mellon, and G. L. Tucker. Registered office: 183, Great Portland Street, W.

Cape Glass Co., Ltd.

Registered to carry on in all or any of their respective branches the businesses of glass manufacturers, and as dealers in all substances used in the manufacture thereof; makers of jars, tubes, tableware, and electrical goods, rolled, sheet, and plate glass, glass benders, bevellers and drillers, staining, colouring, and tinting glass and other materials for all purposes; workers in lead for the purposes of leadlights; manufacturers of and dealers in pottery of all kinds, bricks, &c.; dealers in stone, minerals, slate, cement, &c. Capital £100,000 in £1 shares. The directors are A. J. Elwes, J. H. Brodie, J. W. Brodie and J. Forster. Registered office: 110, Cannon Street, E.C.

John Whittle & Son, Ltd.

Registered to carry on business as builders' furnishes and general ironmongers contractors and outfitters, hardware dealers, joiners, cabinet makers, upholsterers, drapers, dealers in china and glass, paper-hangers, oil and colour merchants, metal, stone and woodworkers, &c. Capital £22,500 in £1 shares. Managing director, W. Whittle.

Exeter Building Estates, Ltd.

Registered to acquire in the city of Exeter any land, buildings, estates, real or personal property, in particular the Mount Radford House Estate and the Grove in St. Leonard's Road in Exeter, and to develop and turn to account the same in such manner as the company shall see fit; as dealers in all kinds of building materials, house agents, &c. Capital £4,000 in £1 shares.

Oldham Property and Investment Co., Ltd.

Registered to acquire any lands, estates and other property, whether freehold, leasehold or copyhold; to lay out land for building purposes; as builders and contractors, dealers in stone, bricks, tiles, cements, sand, lime, &c. Capital £20,000 in £10 shares. The directors are S. Thomson and R. Redfern. Registered office: 28, Retiro Street, Oldham, Lancashire.

J. Parkinson & Sons (Blackpool), Ltd.

Registered to acquire the business of Jacob Parkinson, of Blackpool, and to carry on business as builders, decorators, joiners, contractors, stonemasons, brickmakers, merchants, dealers in stone, sand and other building requisites, sawmill proprietors, &c. Capital £12,000 in £5 shares. The first directors are J. T. Parkinson, A. L. Parkinson and W. Parkinson. Registered office: Kent Road, Blackpool.

Warwick Sawmills Co., Ltd.

Registered to acquire the business of a timber merchant and sawyer as now and hitherto carried on by J. M. Wilson at 96 to 100, Henry Street, and Canal Bridge, Ancoats, Manchester, as the Warwick Sawmills Co., and to carry on the general business of timber merchants and sawyers; also as metal workers and engineers, &c. Capital £3,000 in £1 shares (600 preference). The directors are J. M. Wilson and Elizabeth Wilson. Registered office: 96, Henry Street, Ancoats, Manchester.

Comyn Ching & Co., Ltd.

Registered to acquire the business hitherto carried on by Comyn Ching & Co. at Castle Street and elsewhere in London, and, generally, to carry on business as ironmongers, smiths, brassfounders, metal workers, electro gilders, wire workers, gas and electric engineers, tinmen, copper-smiths, plumbers, &c. Capital £30,000 in £1 shares (15,000 preference). The directors are S. Chitty, B. G. Williams, H. Ward and J. G. Smith. Registered office: 54, 56 and 58, Castle Street, W.C.

Bundock's Wharf and Cartage Co., Ltd.

Registered to acquire the business of a cartage contractor as carried on by W. H. SMALL-POX

is still prevalent in London, despite all the efforts which have been made to stamp it out. Every reader in the Metropolis should

INSURE AGAINST IT

by adopting our Insurance Policy No. 3.

These are the three Schemes:—

- (1) *A Free Accident Insurance of £500 to every regular reader of our paper.*
- (2) *An Accident Insurance of £500, and also £250 for Permanent Total Disablement. £2 10s. per week for Temporary Total Disablement.*

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

- (3) *An Accident Insurance of £1,000, with the following special additional advantages: £500 for Permanent Total Disablement. £6 per week for Temporary Total Disablement. £1 10s. per week for Temporary Partial Disablement. £30 Annuity. £3 per week during confinement from such illnesses as Small-Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c.*
- Ordinary Risks, Premium, £3/-
Hazardous Risks, Premium, £3/10/-

Write for Proposal Form.

These Insurances are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

SPECIAL NOTICE.

- (1) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.
- (2) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.
- (3) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.
- (4) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.
- (5) In applying it is only necessary to write a postcard, giving the full name and address of the newsagent from whom the copy is obtained.

A Pamphlet, giving full details of the THREE SCHEMES will be sent on application to

THE MANAGER, BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

W. R. E. Halse, Horse	3,475	A. A. Gale & Son	2,900
F. Kemp	3,439	G. Allard	2,700

Accepted. [Rest of Woking.]

The Norwich and District Master-Builders' Association held its annual dinner last week, the president of the Association, Mr. James S. Smith, occupying the chair.

Newport Power Station.—The tender of Messrs. A. S. Morgan & Co., of Godfrey Road, Newport, Mon., has been accepted for the power station buildings, chimney shaft and car and repair sheds for the Newport Corporation at the sum of £23,549 14s. 9d., subject to sundry modifications to reduce the cost somewhat. The firm has just completed the foundations contract at £8,547 7s. 3d. The whole of the buildings are to be faced with red pressed bricks with dressings of Bath stone, the latter being in lieu of terra-cotta originally specified. It is expected that the whole of the works will be completed by January next. The engineer for the work is Mr. H. F. Parshall, of London; and Mr. Harry B. Measures, of London, has undertaken the architectural portion.

A New Board School at Willesden was opened in Salisbury Road last Thursday by Dr. H. G. Bonavia Hunt, chairman of the Willesden School Board. It is built of red bricks, with terra-cotta dressings, tiled roofs, and a large flèche of copper. There are on the ground floor seven infant classrooms, with large hall, cloak-rooms and teachers' rooms. On the first and second floors there are fourteen classrooms with a large hall with balcony on one side for entrance to classrooms on second floor; there are also cloak-rooms, master's room and teachers' rooms. The cookery and laundry centre for girls and manual instruction centre for boys are in separate buildings at the ends of the main building. The school is heated by hot-water from one large boiler. The architect is Mr. Laurence A.R.I.B.A. The whole of the work has been carried out by Mr. Drake, of Messrs. Cowley & Drake of Willesden Green. The same firm is now engaged on a similar school for the same Board. Mr. Knight was the clerk of works.

Masters and Men.

Bradford Builders and Overtime Pay.—At the annual meeting of the Bradford Master-Builders' Association, Alderman W. Holdsworth was re-elected president. It was reported that a dispute had arisen in connection with payment for overtime on the new Bradford electricity works, which are being erected by day and night shifts, and a Conciliation Board was appointed to meet representatives of the men in accordance with the terms of the settlement of the recent masons' dispute.

The Peterborough Brick Trade.—There are indications of a general strike in the brick trade around Peterborough, and already the men at one yard to the number of fifty have struck. The workmen generally are greatly dissatisfied with the present rate of wages, and on the other hand the masters are not in a position to offer more favourable terms, as in order to compete with other makers in the London market bricks have to be sold at practically cost price. The men are aware of the fact that just now stocks are small and orders are large.

The Plymouth Masons are somewhat disturbed to find that the cut-stone for a new Board school is being brought all the way from Torquay. The apparent reason is that the contractor can procure the stone cheaper from Torquay, plus carriage, than it can be had from the quarries a few hundred yards away. A large employer of labour states that he has skilled masons working for him as labourers at 5d. an hour, because if they work as masons at all they are bound to be paid 8d. an hour, and that on most jobs now is a prohibitive price. Whenever possible, too, brick is being substituted for cut-stone. The allegation which is made against the mason's society there is that they are driving the stone-cutting work out of Plymouth.

Labour in February.—The Board of Trade reports that the general state of employment improved slightly during February. Compared with a year ago there is some improvement in the coal, iron and steel industries, but a decline in engineering, shipbuilding, building and certain other groups of trades. The general percentage of unemployed returned by trade unions at the

end of February, though higher than a year ago, is lower than the mean percentage for February during the past ten years. Employment in the building trades has fallen off to some extent. The percentage of unemployed union members among carpenters and plumbers at the end of February was 5.9, compared with 5.0 per cent. in January and 5.2 per cent. in February of last year. Eighteen fresh disputes began in February, involving 6,950 workpeople, of whom 6,400 were directly and 550 indirectly affected. The corresponding number of disputes in January was thirty three, affecting 23,558 workpeople, and in February 1901, twenty-five, affecting 6,945 workpeople. The changes in wages reported during February affected 111,751 workpeople, and the net effect of all the changes was a decrease averaging 3d. weekly per head. Of the total number, 1,211 received advances and 110,540 sustained decreases.

COMING EVENTS.

Wednesday, March 26.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Inspection and Demonstration at the East London Water Works, Lea Bridge Road, Clapton, at 3 p.m., conducted by Mr. W. B. Bryan, M.I.C.E.

An Architectural Causerie.

The Great
Scheme for
Washington.

WHILST we have been busy
with a national scheme to com-
memorate Queen Victoria the
Americans have been formu-

lating a much greater scheme for the develop-
ment of Washington, a scheme which, so far as
landscape architecture is concerned, is more
magnificent than any carried out in recent times.
Washington has very deservedly been called the
City of Magnificent Distances. Its plan is un-
doubtedly the finest which the United States
possesses, thanks to the genius of that young
French officer, L'Enfant, who was so admirably
suited for collaboration in the great projects of
Washington and Jefferson. Some time ago a
committee composed of the two foremost of
American architects, a noted landscape architect
and an eminent sculptor was selected to evolve
a scheme for the development of Washing-
ton on a scale compatible with the glory of the
nation; and after most thoroughly investing
the matter and spending a summer tour in
Rome, Venice, Vienna, Buda-Pesth, Frankfurt,
Berlin, Paris and London—thus embracing the
whole of European effort—they have produced
a remarkably fine plan, both as regards
practical workability and artistic merit; and
though it is impossible to describe in words
the effect of their scheme, some particu-
lars may be given from which at least
some idea of its grandeur can be gained.
It is proposed, then, to make the Mall of a
uniform width of 1,600ft. throughout its entire
length, and the axis of the Capitol and the
Washington Monument is to be defined by an
avenue a mile and a half long and 300ft. wide,
with elms planted on either side, four abreast.
The cross axis of the Mall, forming a thorough-
fare between the body of the city and river-
front, will be laid out as a garden, and areas
adjacent to the Mall and averaging more than
400ft. in width from the Capitol to the Washing-
ton Monument are set aside as sites for the
museums and buildings devoted to scientific
purposes; while the unsightly railway terminus,
which is now in the Mall, will be removed to
another portion of the city. Not only will the

Monument thus be brought into the Capitol
vista, but the Mall will be restored to its original
use as a grand setting for the two great buildings
of the nation, the Capitol and White House. To
the distance of a mile and a half from the
Capitol to the Monument the reclamation of the
Potomac flats adds another mile, giving oppor-
tunity for an extension of the treatment accorded
the Mall and also of a new and great memorial
to Abraham Lincoln, to stand on the axis of the
Capitol and Monument, near the bank of the
Potomac; the proposed memorial consisting of
a portico of Doric columns 250ft. long by 220ft.
in width. In addition, a broad paved quay or
landing space will skirt the Potomac, and thence
a memorial bridge is proposed to be erected at a
cost of £3,000,000. Connecting the Washington
Monument and the Lincoln Memorial will be a

in Washington one of the most beautiful and
complete of the cities of the world.

Ceilings.

WE have very much to be
thankful for as regards our
ceilings; in fact these are the most uniformly
pleasing feature in the generality of modern
houses. The reason is that they have been kept
entirely plain and white. One may go into a
house of wretched design, and the walls may be
covered with the most atrocious wallpaper, yet
the ceiling is the one redeeming feature. Its
even undecorated surface is a relief from the
fussy ornamentation that may be present in
every other part of the house. Latterly, how-
ever, there has been a decided tendency to
encroach, and though a decorated ceiling is not
an evil *per se*, yet the tendency is one that needs

WESTMINSTER COLLEGE, CAMBRIDGE: THE LIBRARY (see page 107).

HENRY T. HARE, F.R.I.B.A., ARCHITECT.

canal 200ft. wide and 2,300ft. long, similar to
those at Versailles and Fontainebleau. West of
the Monument it is planned to place a garden,
which will create an axial relation with the
White House, this being accomplished by a
sunken garden framed in by tree-bearing
terraces in the shape of a Greek cross; the
centre being marked by a great pool, with rec-
tangular basins and a flight of steps 300ft. wide
leading from the garden to the base of the
Monument; and the whole scheme embodying a
wonderful array of fountains. It is evident from
these particulars how splendid the conception
is. The cost will be enormous, but this will
be no stumbling-block to our wealthy cousins:
and as there seems every probability of the
scheme passing Congress we may hope to have

to be watched very closely in view of the prob-
ability that the "decoration" will spoil and not
enhance the ceiling. A tinted plaster cornice,
with perhaps a coloured frieze below, can be of
most excellent effect, and it would be well if the
decorator stopped at this; but he rather inclines
to either paper the ceiling with a great pattern
or to cover it with heavy modelled work: both
of which methods defeat their object. As to
painted ceilings, in nine cases out of ten these
are an abomination: they require that the
painter shall almost lie on his back to execute
them and they strain the neck and eyes of those
whose misfortune it is to view them. No ceiling
decoration should be intricate: if there is any at
all it should be sufficiently uninvolved that the
eye embraces it at once and without effort.

TEMPLE OF CONCORD, GIRGENTI. DRAWN BY F. HAMILTON JACKSON, R.B.A.

SICILY AND ITS ARCHITECTURAL MONUMENTS.—V.

By F. HAMILTON JACKSON, R.B.A.

(Continued from p. 36, No. 369.)

ONE may go from Syracuse to Girgenti by two routes; either southwards to Noto, Modica, Ragusa and Licata, whereby many ancient sites are passed, such as Camarina, Gela (now Terranuova), Phintias (now Licata) and the others named, all of which are ancient—but this route has the inconvenience, to those who are at all pressed for time, of there being no through trains; so that the traveller is obliged to stay for the night at one of two or three places none of which possesses a tolerable hotel, for the Sicilian hotels are for the most part much behind those of the rest of Italy. The other way is to return to Biccoca, a short way from Catania, and take the Palermo express, which has a carriage or two attached to it for Girgenti. The line runs up the valley of the Dittaino, which is scarcely as interesting in the way of scenery as some of the other valleys or the coast lines, and after passing Catena Nuova, where great heaps and blocks of sulphur lie about the station, and from which Centuripe is seen picturesquely perched on its hill with Etna behind, it ascends rapidly. After passing Leonforte the valley of the Dittaino is left, the ascent being extremely steep towards Castrogiovanni (the ancient Enna) and Calascibetta, which frown across the valley at each other, seated on their lofty hill sides. The mountain scenery at this part of the route is superb and the line shows great engineering skill. Beyond S. Caterina Xirbi, where the Palermo train drops the carriages for Girgenti, is Serradifalco, the place from which the great Sicilian archaeologist

took his ducal title. The line descends after passing Canicatti, and at Aragona Caldare joins that from Palermo to Girgenti, which lies seven miles to the south. Along this line the headquarters of the trade in sulphur may be said to be established, one-sixth of that mineral being shipped at Porto Empedocle, and at Comitini Zolfare, three stations from Girgenti; the whole air smells sulphureous.

Girgenti is the Akragas of the Greeks and the Agrigentum of the Romans. In the Middle Ages it was the seat of the most richly endowed bishopric in Sicily, which was considered the first in importance, a position which it retained for a long time. The modern city occupies a part of the ancient acropolis only, but sufficient traces of the ancient walls remain to enable one to realize how large a place it was in its prime. The great temples are the principal attraction at Girgenti, but the situation of the town is superb, and the view from the promenade below the "Rupe Atenea" stretches far and wide over hill and plain, over cape and sea, and is splendid whether seen when the mists of early morning half hide the opalescent distance, at midday when the blue African sea enforces the brilliancy of the sunlight upon the yellow rocks and earth, or by evening light when all the colours are mellowed and blended against the lovely sunset sky.

The temples stand on the edge of a precipice which gradually declines to the Porta Aurea, in the following order. At the easternmost point, overlooking the watercourse now called Fiume S. Biagio; but anciently Akragas, stands the temple of Juno Lacinia, next that of Concord, followed by that of Hercules, between which and that of Jupiter the road to the Porta Aurea passes. Beyond are those of Castor and Pollux and of Vulcan, which look down on the ravine of the Drago, anciently the Hypsas. Besides

this magnificent range there are the remains of a temple in the city, believed to be those of the temple of Jupiter Polieus, and beyond the "Rupe Atenea" the Norman church of San Biagio is built upon part of that of Ceres and Proserpine. Cavallari, however, thinks this was a temple to Akragas, and connects it with a statue of a beardless youth found in the valley below, and now in the Communal Museum under the name of Apollo. Nearly all these names are conjectural.

The temple of Juno is a peripteros hexastylus with thirty-four fine Doric columns, which have twenty flutings. Their height is five times their diameter, and twenty-five of them are standing; the remaining nine, which have been re-erected, have only half their height. At the eastern end is a little terrace reaching to the wall of the town, upon which statues probably stood, or votive tripods, or perhaps an altar for use on great festivals when the concourse was greater than the temple would hold. The temple of Concord is very well preserved, perhaps because it was converted into a Christian church in the middle ages, at which time the arched openings in the walls of the *cella* were made. It is of the same kind as the last named but much more complete, retaining its pediments at both ends. In the rocks below, outside, are Christian tombs, and an early catacomb is passed on the way to the temple of Hercules. The remains of this are slight, though it is interesting as being thought to be the oldest of these temples. It had thirty-eight columns, and both in the remains of decoration on the plaster coating discovered by excavation, of fragments thrown down by the Carthaginians, and in certain peculiarities of plan it resembles the most ancient of the temples at Selinunt. From this shrine Verres tried to steal the statue of Hercules by night, but his slaves were repulsed by the

citizens who rose in defence of their property. Here too, it is said, was kept the painting of Alcmena by Zeuxis, and from this spot the statue of Esculapius, now in the museum at Palermo, was taken. The Porta Aurea, marked by the modern road which still follows the ancient direction, is the gate by which the Romans entered in 210 B.C. At the other side are the custodian's house and the temples of Jupiter and Castor and Pollux. The former was never completed. Erected in the fifth century B.C., its special peculiarities were the colossal telamones, 25ft. in height, one of which has been reconstructed on the ground, and the huge engaged columns, each 20ft. in circumference, with flutings broad enough to allow a man to stand in each, as they say, but which only measure 18in. across. Down to 1401 a considerable part of the temple was in existence, but it has since been used as a quarry, the modern mole at Porto Empedocle having been the last use to which the stones have been put. A little further on is the temple called that of Castor and Pollux, consisting of four Doric columns with a portion of entablature, re-erected by M. Cavallari from the remains of two different buildings. Here and on others of the temples are distinct traces of stucco and colour, the stone used for building them being a porous, yellow, fossil limestone which bears the ravages of scirocco badly. The remains of the temple of Vulcan situated in a garden a little farther on are insignificant. Outside the walls are the remains of two or three other antique buildings—the so-called tomb of Theron; a later building of Roman date, the mixture of Ionic and Doric details showing a period of decadence; the temple of Esculapius; small remains built into the wall of a house supposed to date from 420 B.C. from the fact of the columns being engaged like those of the temple of Jupiter; and portions of a Greek house which have been uncovered, with several mosaic floors.

An interesting building is passed on the way to the town from the temples, the church of S. Nicola, built in Norman times, partly with ancient material and on part of an ancient site. Behind the high altar is a little courtyard with a heavy cornice and rude painting on the frieze below, similar to the cornice on the façade, which appears to be ancient material; the side walls have an arcade of a flat curve supported by piers with curious projecting mouldings half-way up, recalling a Roman podium. The roof is a barrel vault of pointed section with chamfered ribs above each pier. The wall against which the high altar is set has above it a row of round-headed niches, separated by small corbelled-out columns and occupied by frescoes which are dated 1574, but look at least a century earlier. The great doorway has an archivolt with fine bold mouldings and the door is panelled in an unusual and effective manner. The back of the church is in the Panittieri garden, which also contains some interesting architectural remains in a picturesque setting. These consist of a beautiful Corinthian cornice, built in at the top of a bastion-like tower which is part of a reservoir and relieves finely against the stone pines and other trees near, and the so-called Oratorio di Falaride, the *cella* of a Roman temple, which is perfect up to the triglyphs of the frieze, converted into an oratory in Norman times, the interior having been vaulted and a two-light window inserted (now built up), while a pointed doorway has been cut in the façade below the original architrave, which still remains. Cavallari excavated to the east of this building and found foundations and columns of a portico, which showed that the temple was tetrastyle and prostyle; but these remains have disappeared.

In the town there are three highly interesting things to see—the cathedral, the ruined church of S. George and the church of S. Maria dei Greci, which is believed to be built upon the ancient temple of Athene. The two temples of Jupiter Polieus and of Jupiter Atabyrius are thought by Schubring to be one and the same and to have occupied the summit of the acropolis, where the cathedral now stands. This still has the original campanile of the fourteenth century, battered and weatherworn, but picturesque and individual. The persistence of Norman decorative details till this late date is curious. The interior has been modernized with abundant stuccoed details. It contains in the Sala Capitolare a very beautiful marble sarcophagus carved with subjects from

the story of Hippolytus and Phædra, and some well-heads which were in the cathedral, beneath which there was once a large cistern. Many documents of the Norman period are preserved in the archives, and according to an Italian account there is a letter from the devil (!) preserved in some part of the cathedral, but the sacristan did not offer to show it to me. For the temple which stood on this site Phalaris collected building material and persuaded the Agrigentines that in order to keep it safe it was well to have a wall built round the place and guards set—by which stratagem he provided himself with a citadel and with soldiers by means of which to fix his yoke upon their necks. The doorway of the church of S. George is pointed and has Norman decorative details, the principal ornament being the well-known zigzag in several ranks, but with the addition of the dog-tooth and of more foliated carving than is found in England at that period. S. Maria dei Greci has thirteenth-century features about it—the west door, for instance—but the interior has been made up with plaster into late Renaissance forms. Some of the Greek columns are visible

in the side walls, but to see the steps of the base upon which they stand, and the lower part of six which are disengaged on the left, one enters a vaulted passage part of which is beneath the street. The "Rupe Atenea," called also "Colle Minervale," is thought by some to have been the site of the temples of Minerva and that of Jupiter Atabyrius, but Cavallari says that he has examined it carefully several times and cannot find any trace of the preparation of the rock for the foundations of a temple. The depression between the two elevations is said to have been cut by Empedocles to dispel malaria by making a passage for the north wind.

Girgenti, according to the Greek accounts, was founded by colonists from Gela in 582 B.C., but it appears pretty certain that this is the site of the Sicilian town of Camicea, though some place this town elsewhere, and Diodorus gives a tradition that when Sicily was invaded by Minos in pursuit of Daedalus he was received by the king of Akragas. Minos was contemporary with the earliest Greek civilization. Polybius says that the Rolioti coming to Akragas built there a temple to Jupiter Atabyrius, which some very

LOWER PART OF CAMPANILE, CATHEDRAL, GIRGENTI.

CHURCH OF S. NICOLA, GIRGENTI.

ancient coins seem to support, proving an immigration of the Lindii, bringing with them the worship of the Moloch of Mount Tabor. The brazen bull of Phalaris probably had some connection with this cult. This tyrant apparently resembled some of the Italian princes of the Renaissance in his cruelty, unscrupulousness, love of art and of learned men, and has had the most varied characters given to him; most of the older writers painting him as a cruel and licentious tyrant, while Lucian and others held a much better opinion of him. The period of the greatest prosperity of Akragas was perhaps that while Empedocles lived there, who persuaded the citizens to have a popular government, beat down the dangerous oligarchy of the rich, and reformed the laws, though the great extension and beautifying of the city was the work of Theron, after the battle of Himera in 480 B.C., when the Carthaginians were defeated and great booty gained by the allied Greek cities and thousands of prisoners taken as slaves. Splendid aqueducts were then made, some of which are in use at the present day.

The accounts of the splendour and riches of the citizens are fabulous. Empedocles said of them that they built as if they were to live for ever, but feasted as if they were to die on the morrow. It is recorded that on the occasion of a certain marriage 800 carriages and innumerable riders brought the bride home at night while the whole city was illuminated. A certain Exainetos won the 200 yds. race at Olympia and when he came home 300 chariots went out to welcome him, each drawn by a pair of milk-white horses. During the Carthaginian war a decree was issued forbidding a soldier on the march to be provided with more than *two mattresses, two pillows* and a blanket. In the gymnasium the utensils were made of gold. At the door of Gellias, a rich man of the city, stood slaves all day long to invite every passing stranger to rest and refresh himself; and once, in

winter, when 500 riders came from Gela, he took them all in, and in addition presented each man with new garments. In his cellars, instead of casks and hogsheds, he had 300 reservoirs for wine hewn in the solid rock, each of which held 100 amphoræ, which is nearly equal to 900 gals. When the city was taken by the Carthaginians this Gellias collected such of his treasures as he could gather together quickly, and with his family retired into the temple of Minerva and set fire to the place, saying that he thus avoided three evils: "The impiety of the enemy towards the gods, the rapine of the sacred riches, and the murder which they would have committed on himself and his family." This was in 406 B.C., when the Carthaginians were led by Himilco. In two or three centuries they reduced its magnificence into a field strewn with ruin; and though it appeared to recover somewhat in the time of Timoleon and took some part in the first and second Punic wars, suffering sieges from both sides, it disappears from history after 207 B.C., when it became finally Roman. In 828 the Saracens took it, the city and surrounding district becoming the headquarters of the Berbers, a race the peculiarities of which may still be recognized in a type of face frequently met with in Girgenti. Rebelling in 937 against their power, after three years it again had to submit, and a severe famine was the result of the struggle. In 1089 it was taken by Roger and his Normans, and four years later S. Geffando was appointed to the bishopric.

The whole of the rock under the modern city is pierced by galleries and chambers into which one may descend at several points. The principal entrance is by the side of the church in the Piazza del Purgatorio. It is disputed whether these were quarries from which the stone of which the city was built was extracted, or places of refuge, or caves in which the earliest inhabitants of Sicily dwelt before they began to build on the surface of the earth. It appears most likely that they were connected with the defensive works of the

city when it was confined to this upper part, and are therefore Sicanian. The Greek city stretched over vineyards and oliveyards, covering a district still known by the name of "Civita," while the famous fishponds are thought to have been in the hollow between the temples of Vulcan and Castor and Pollux. Akragas was called by Findar "the most beautiful city of mortals," and he who studies its remains and tries to reconstruct its magnificence, set in the beautiful landscape which still surrounds it, may well believe the expression justified.

(To be continued.)

SCAFFOLD ACCIDENTS.

A SHORT time ago the Home Office issued the following reprint (with some additions and modifications) of a report which appeared in the annual report of the Chief Inspector of Factories for 1900. The modifications introduced have been made upon the suggestions of leading experts who have been consulted. A special abstract summarizing the provisions of the Factory and Workshop Act, 1901, so far as they apply to buildings in course of construction, will be supplied on application to the Home Office (Factory Department), Whitehall, S.W.:-

The dangerous conditions in building operations may be divided into two classes—(a) those arising from imperfect scaffolding, and (b) those arising from the lifting and carrying of material.

Scaffolding.

The two principal methods are known respectively as the north- and south-country systems. The northern, as the name indicates, is principally used in Scotland and the North of England, although of late years it has also found favour in the South; the other method (see Fig. 1) is essentially the south-country system.

The first method is invariably used in conjunction with power, generally a steam crane. When one crane only is necessary it is fixed upon a triangular platform built upon three legs, one at each angle, and is raised to such a height as to be well over the building to be erected. The crane stands over the principal or king leg. Owing to the guys it cannot make a complete revolution. If power is required that can be utilised on all parts of the building, the erection has a square platform with a leg at each angle, and two cranes are then fixed, being placed diametrically opposite to each other. The three or four legs, as the case may be, are of framed timber, bolted, and are weighted to the ground by masses of brickwork. The whole is so well built that accidents occurring through faults of construction are extremely rare. The greatest dangers arise when the crane is imperfectly fixed, and when the weight of the crane engine and load is too much for the king leg on which it rests, and when the legs are not sufficiently far from the king leg.

With regard to the first point, the guys of the crane should always be carried to the centre of the secondary legs and chained down to the masses of brickwork which weight these legs at their feet. This chain requires frequent examination, especially when a heavy load is being raised, as owing to the vibration of the scaffold it becomes loose, and if not tightened the crane would lose its rigidity and accidents would be likely to occur. In the second case, where the weight is great, the king leg should have an additional central upright running from top to bottom (see Fig. 2, which is a plan of a king leg).

The second form of scaffolding presents many points of interest. In order to render this report more intelligible, notes are given on Fig. 1 which explain the technical terms used. There are two varieties also of this form of scaffold and their use depends upon the material of which the building is being constructed—brick or stone. Where bricks are in use, one row of standards and ledgers only is necessary; the putlogs resting outwardly on the ledgers and inwardly on the wall (where header bricks have been left out for their reception). On stone buildings, and more especially when ashlar fronted and where an opening in the wall would leave a permanent disfigurement a double set of

standards, &c., is necessary to carry the putlogs (see Fig. 3, which is a section of what is known as a mason's scaffold).

The different marryings, tyings, &c., should be carefully watched, as scaffolds have been known to come down owing to the cords slipping. This happens more especially when cords have been used damp, the influence of a hot sun causing them to relax considerably. Wedge-driving between cords and posts is the usual method of tightening. The boards on which the men work should be carefully kept in position. Fig. 4 shows the usual position of the boards. Carelessness may and does result in these losing their place, and if by so doing they take the position shown on Fig. 5, what is known as a trap is formed. Fig. 6 illustrates the working of a trap. It will be noticed that when on the boards it is not easy to tell where the putlogs are. This to a great extent creates the danger. A certain preventive would be for the putlogs to be used in pairs; the boards then, instead of overlapping, could be placed end to end (see Fig. 7); in overlapping, boards get out of place and a second man of two may catch his toe against the end raised.

Two of the commonest forms of accidents occur on these scaffolds—the falling of the workmen, and the dropping of the material from the upper floors of the erection. On the outside of the scaffold, also at the ends, a guard-rail should be lashed to the standards about 3ft. 6in. above the scaffold boards. This would obviate the first danger. With regard to the second, the danger from falling material is much to be deplored, as though it can occur in many ways it is as a rule the result of great carelessness. A board on edge running along the outside of the scaffold, but within the uprights and nailed to them and again at the ends, would to a great extent prevent this class of accidents. Unfortunately, this board cannot be fixed on the inward side of the scaffold, as it would interfere with the free use of the workmen's tools. Figs. 1 and 3 show the guard-rail and board on edge.

A mason's scaffold should be supported in such a manner that no opportunity could occur for it to fall away from the building. Fig. 3 shows the shoring which is the usual method of preventing this where room permits—but this cannot be applied in a street, and in that case the scaffold should be tied to the inside of the buildings by poles through the openings.

There are other conditions of risk involved in insufficient width of runs, and in the use of centering improperly supported. A run is commonly seen only one board wide (9in.). It is needless to say that this width is dangerous: 18in. is the least that should be allowed. A run for continued use would be better made of two 3in. by 11in. planks, if two planks are used. A slip of wood can be nailed across the undersides to keep them together. Fig. 8 is a plan of a working platform surrounding a courtyard or well, and gives three examples of runs which are commonly used, but which are not satisfactory. Improperly supported centering is seen only in cheap work. Figs. 9 and 10 illustrate what is meant. It will be noticed that the supports to the centering of Fig. 9 are kept in their position entirely by the lateral pressure exerted by the stay A. It follows that if this pressure is eased sufficiently, say by shrinkage, it is more than probable that the centering and a large portion of the unfinished arch would fall. Fig. 10 shows the centering properly supported. All supports to centering should rise from a solid foundation. Painters' boats occasionally fall owing to the use of defective cordage and supports. Care is the only remedy that can be suggested. Ganties (especially those erected over the public way) having to carry great weights should be effectively strutted and braced, and timber of sufficient strength used.

Lifting and Carrying Material.

Very little danger arises during the lifting and carrying of material so far as the power in use is concerned. The accidents generally occur owing to the defective manner by which the material is secured to the crane, pulley wheels, or whatever the arrangement for lifting may be.

Ironwork.—Ironwork is principally used in the form of girders or columns. These are sometimes slung by a chain round the middle and as evenly balanced as may be. There is considerable danger of this chain slipping, how-

ever well balanced (more especially if the load when swinging is tilted, say, by receiving a jar through touching some part of the erection), and thus allowing the material to fall. To prevent this a second chain may be run from each end of the column or girder to a point some distance up the supporting chain, but the best remedy is a "softener," i.e., an old bag or sack put round the ironwork first, and the chain turned twice round it over the "softener" and knocked as close as possible; then no slipping will take place. The same applies to timber.

the ends to take an inward slope. If the crate is tightly packed this pull creates a pressure on the material and tends to keep it in position, but if loosely packed the absence of sides would be a source of danger, as the material could easily fall out. If a similar crate were used to carry a roll of lead, it would be necessary to place a stay (B, Fig. 12) across the top to counteract and relieve the strain at the bottom. When baskets are used, the danger lies in the handles. If they are hooked to chains, which is the usual method (Fig. 13), the weight may, and

Timber.—Timber in lengths can be carried in the same manner as the iron girders, but owing to the greater friction set up between wood and iron it is not so likely to slip as the former. The same precautions, however, are necessary.

Bricks, Slates, &c.—Bricks, slates, &c., in large quantities are slung in crates, in smaller quantities in baskets, and in small work are carried in hods by labourers. The crates (Fig. 11) will carry as many as 350 bricks. It will be noticed that they are not fitted with sides. This is to facilitate loading. The chief danger arises from their use when they are improperly packed. When suspended the pull on the handles causes

does, cause them to give way. One remedy is for the chain or rope to be carried round the basket, as shown in Fig. 14. The pieces of wood marked "R," if fixed as shown, would give the basket a level bottom and would also tend to prevent the rope slipping. A better course would be so to construct the basket that the material of which the handles are made should be carried down the sides and along the bottom of the baskets and well secured there. In any case care should be taken to see that the baskets are strong enough in the first instance, are kept in proper repair, and not overloaded, and that spring hooks are used on the slings.

Stone.—There are several methods of lifting stone. It can be lifted in the same manner as ironwork, or may be suspended by means of a "lewis," or again by means of nippers. The first method is perhaps the safest, but is generally used for undressed work only, as the chain is apt to break up any finished edges, &c. As regards the second method a hole is cut into the stone wider at the bottom than at the top, three pieces of iron (as shown on Fig. 15) are fitted into it, the outside or splayed pieces first, and the rectangular centre piece last. A bolt running through the top of each fixes its position, and at the same time secures a ring into which the hook, by which it is to be lifted, is placed. This arrangement will lift a very great weight. They are made in all sizes to suit; the softer the stone the deeper they ought to be in proportion to the weight. The risk of its giving way if the stone is not free from vents, or when the lewis does not fit the hole, or again if the weight is not evenly distributed, is considerable. Its use with perfect safety can only be left to the judgment of the mason. The nippers clutch the stone on the outside. Danger may arise if the small holes picked out to receive the nippers are so near the top edges of the stone that the points drag out; or again, the centre of gravity may be above the points, causing the stone to turn over and fall. It is, of course, assumed that the plant in use has been both in point of quantity and quality (and the first is of equal importance with the second) fully sufficient. It is regrettable that often in actual practice this has been found not to be so. Inferior tackle has been and is responsible for many accidents. Many lives could have been saved if a little forethought had been used, and compliance made with those unwritten rules by which workmen should be guided. Fig. 16 will give a clear illustration of what is meant. A labourer, in building a scaffold, required a ledger at point A. He fetched it from point B. He carried it upon his right shoulder, and in turning the corner in the direction of the arrow the end of the pole struck against standard C. The recoil immediately knocked him off the scaffold. If the pole had been upon his left shoulder, the blow would have fallen harmlessly and his life would not have been lost.

Some Suggestions.

The following suggestions, if carried out, would tend materially to reduce the number of accidents occurring on buildings in course of construction or repair:—

(1) All working platforms above the height of 10ft. taken from the adjacent ground-level should, before employment takes place on them, be provided throughout their entire length on the outside and at the ends (a) with a guard-rail fixed at a height of 3ft. 6in. above the scaffold boards (openings may be left for workmen to land from the ladders, and for the landing of material); or (b) with boards fixed so that their bottom edges are resting on or abutting to the scaffold boards. The boards so fixed should rise above the working platform not less than 7in. Openings may be left for the landing of the workmen from the ladders.

(2) All "runs" or similar means of communication between different portions of a scaffold or building should be not less than 18in. wide. If composed of two or more boards they should be fastened together in such a manner as to prevent unequal sagging.

(3) Scaffold boards forming part of a working platform should be supported at each end by a putlog, and should not project more than 6in. beyond it unless lapped by another board, which should rest partly on or over the same putlog and partly upon putlogs other than those upon which the supported board rests. In such cases where the scaffold boards rest upon brackets the foregoing suggestion should read as if the word "bracket" replaced the word "putlog." (Experiments have shown that a board with not more than a 6in. projection over a putlog can be considered safe from trapping or tilting.)

(4) All supports to centering should be carried from a solid foundation.

(5) In places where the scaffolding has been sublet to a contractor the employer should satisfy himself, before allowing work to proceed on it, that the foregoing suggestions have been complied with, and that the material used in the construction of the scaffold is sound.

Engineering Notes.

The New Police Station at Prestatyn has been fitted by Messrs. John King, Ltd., of Liverpool, with their "small tube" hot-water apparatus.

The Westbrook Temporary Hospital, Herne Bay, is being warmed and ventilated by Shorland's patent Manchester stoves and special inlet tubes, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The Whitechapel and Bow Railway, which has been under construction for the past three years, will be opened to the public on May 1st. The line connects the District Railway at Whitechapel with the Tilbury line at Bow, and will allow either steam or electricity to be used as the motive power.

The Harbour Works at Colombo.—An extensive series of important works is being carried out at the present time in the harbour of Colombo. These consist of two breakwaters, a graving dock, a slipway and a coaling depot. The sheltered area enclosed within the harbour will be about 660 acres, which will give to Colombo one of the largest artificial harbours in the world. The north-east breakwater, which is practically complete, is built of rubble *pierre perdue*, thrown into the sea with a base from 200ft. to 300ft. wide, with a width of 70ft. at the top and a height of 7ft. above sea-level. The north-west breakwater is constructed of concrete blocks about 30 tons in weight. The graving dock will be 600ft. in length on the floor, 121ft. in width at the copings and 85ft. at the entrance, with a depth of 30ft. over the sill at low water. The slipway will have a gradient of 1 in 20, and at the outer end will be covered by 25ft. of water. At that end, resting on a rubble bed, the sections of the platform have a framework of jarrah wood encased in concrete, but higher up, where the weight of the vessel will bear more fully as it is drawn out of the water, concrete work, based upon piles driven down to a solid stratum, is employed.

Correspondence.

The New Cowl Tests.

To the Editor of THE BUILDERS' JOURNAL.
CAPE TOWN.

SIR,—I am flooded with numerous pamphlets relating to the new Cowl Committee tests, presumably because my name has been mentioned in the report published by the Sanitary Institute. I wish to state that I do not agree with all the abuse that has been heaped upon the late Mr. Rogers Field; at the same time, Mr. Rogers Field and myself were not in accord as to how the experiments should be conducted or tabulated—hence my early departure as an assistant from his active efforts to unravel the mysteries of ventilation. I must explain that it was purely an accident that I became connected with these experiments, and that both before and after I left Mr. Field others were hard at work on the numerous problems, and did their duty conscientiously under orders received. Although the methods of testing were undoubtedly defective, I am sure that at some future date some one with ample time and funds will thank the Sanitary Institute and Mr. Rogers Field for so large a number of recorded experiments. The subject is a most difficult one, at the same time a very important one, and should not be howled down by interested manufacturers of cowls. Did you ever know a man who invented a pump for water or for air without declaring it the most efficient and economical in the market? After wading through more than 2,000 experiments conducted by Mr. Rogers Field I soon saw that the subject had a wider range, *i.e.*, the flow of air across such tubes and finials must follow some laws at present difficult to grasp but once mastered would also apply to river and harbour mouths, &c. I quite agree with some critics that the tests were made on too small a scale and, I may add, without proper precautions from a scientific standpoint: but to class them as totally valueless is at once rash and ungrateful. No man could have been more serious in his work than Mr. Rogers Field, and I am surprised no one has so far spoken a good word for him.—Yours truly, A. W. ACKERMANN.

New Patents.

These patents are open to opposition until May 5th.

1901.—Sinking Shafts for Foundations.—4,625. J. WILSON, Craighenall, Falkirk. The shafts are sunk by a hollow column formed with an armoured cutting edge at the bottom. This column is provided with a number of pipes down which fluid or gas is forced when the soil resists the downward pressure, being thus loosened so as to allow the column to sink. The loosened matter is sucked up by a central pipe.

Wallpaper Trimming Machines.—6,065. C. BÜTENBENDER, 15, York Place, Baker Street, London, W. The machine consists of two pairs of scissor-like shears which trim the paper at each side, the paper being automatically advanced after each cut. It is claimed that the device is simple and inexpensive.

Cheap Houses.—6,115. J. A. BRODIE, City Engineer, Liverpool. According to this invention houses for the poor are constructed almost entirely of concrete. The walls, floors and roofs are formed of separate concrete slabs completed at the works, and the edges have interlocking joints which are fixed with cement. The roof is flat, with the necessary slope to take off water, and the inside stairs are of concrete. The advantages claimed are cheapness, sanitary condition and rapid construction.

Bath Fittings for Asylums.—6,570. T. W. TWYFORD, Cliffe Vale Works, Hanley. The hot and cold water supply valves are of the ordinary screw-down type, but are so arranged that hot water cannot be let into the bath until the cold-water tap has been opened, and also the latter cannot be closed until the hot-water tap has been shut down, thus obviating any risk of scalding.

Hydraulic Rams.—7,340. R. RACKHAM, of Robert Warner & Co, Walton-on-the-Naze. This invention relates to rams of the suction-pipe type or those in which the waste water is conducted below the standing level of the tail water. The discharge valve has a horizontal hollow stem containing a spring, with holes for admitting air either to the suction chamber or to the body of the ram. The end of the horizontal stem works in a water tank having a screw plug for regulating the height of the water.

The following specifications were published on Thursday last, and are open to opposition until May 12th. A summary of the more important of them will be given next week. The names in italics are those of the communicators of the inventions.

1901.—4,345, SHARPLES, stop taps. 4,437, WILSON, blocks for arches. 4,457, WARD & WARD, water-supply cisterns. 4,500, WATKINSON, shower apparatus for baths. 4,702, HECHT & POULENC, manufacture of lacquers and varnishes. 4,466, HEAWOOD & HULME, metal rings for jointing pipes. 5,509, AXER, drying kilns. 5,895, WEBBER, windows. 5,970, TIMOKHOWITCH, ventilation of rooms and buildings. 6,350, STANLEY, manufacture of tiles. 6,481, BUTLER & HUNT, combined intercepting trap and flood valve. 6,837, SUTCLIFFE, hydraulic presses for slabs, blocks, &c. 6,868, PEGG & PEGG, gravel washing machines. 7,087, KAYE, locks or latches for sliding doors. 7,126, TEMPERLEY, TEMPERLEY & TEMPERLEY, wood or other block pavement and flooring. 7,768, BARTY, placing rope grips on aerial ropeways. 7,784, LE MAITRE, window sashes, casements, &c. 9,293, SCHMIDT, road-cleaning machines. 10,455, LAKE (*Confalonieri & Confalonieri*), floors. 12,272, LAKE (*Fried. Krupp Grusonwerk*), artificial stone blocks, &c. 18,163, SCHWARZ, machine for preparing materials for artificial stone. 21,972, WEBB, door checks. 25,213, FERGUSON, instrument for measuring and recording distances travelled and for surveying purposes. 26,074, BATES, taps. 26,434, GILBERT, mitre-planing machine.

1902.—505, MONNOYER, sinking and construction of wells. 1,293, HOSSFELD, means for preventing draughts. 1,324, COULSON, conveyor or transporter belt. 1,681, MITCHELL, pipe cutters. 1,842, SOMERS, fireplaces.

Views & Reviews.

Chronicles of the Tower.

The second volume of this work continues the chronicle of social and historical events in the Tower from the time of the Stuarts to the present day. It cannot be said that the volume possesses any essential architectural importance, though the study of the building as a palace, a prison, a law court and a barrack makes interesting reading. The conspicuous part in the national history which London's fortress has filled in the past is sufficiently and ably set forth; and the author's acknowledged skill in anecdotalism makes the assimilation of the facts both easy and pleasant. Of antiquarian value are the many views of the Tower reproduced from old pictures and prints, which relate, pictorially, its transition from a Norman fortress to a barrack almost as clearly as does the text in words. Executions have always exercised a morbid curiosity in human minds, and in the present volume this is evidenced by numerous reproductions from contemporary prints showing the infliction of the death penalty on the rebel Lords, 1746-7. Judging by the numerous well-filled stands, these dread events constituted important social functions. The need of the supervising hand of the County Council is shown in the illustration (facing page 130) of a stand collapsing at the execution of Lord Lovat, whereby—as we are told underneath—"above fifty persons lost their lives and were disabled."

In Appendix IV, under the title of "Recent Discoveries at the Tower" Lord Ronald Gower gives some valuable particulars of Roman work disclosed by the demolition of a range of buildings on the east side of the White Tower, believed to have been originally built in the fourteenth or fifteenth century, but which had been so patched and altered as to have lost all antiquarian interest. The building was entirely removed with the exception of those portions of the south walls and the ruins of the Wardrobe Tower which form the north wall of the Tower Armoury erected in 1826. It was during this work of demolition that Roman tiles and mortar were found worked up into the material of which these walls were built. "At the south-east corner, and adjoining the remains of the Wardrobe Tower, a portion of Roman wall was disclosed, having three courses of bonded tiles, showing above the surface of the debris. This piece of wall is in a direct westerly line with the old city wall, shown in a plan of the Tower, made in 1597." The author's inference from this discovery is that either the wall is part of the original Roman city wall, or it forms part of the remains of a Roman building, in which latter case it proves the existence of a previous Roman fortress on the site of the White Tower, always a contested point. Stowe's evidence that the Conqueror caused the present White Tower to be erected at the south-east angle of the city wall, which would be the actual spot where the fragment was found, points to the former hypothesis as the most probable. The Cradle Tower (the third tower on the southern side of the Ballium walls) has now proved to be the entrance to the Queens' apartments from the river, they having extended from the Lanthorn Tower to the south-east angle of the White Tower, and the space recently cleared formed the queen's private garden.

The author protests strongly against the hideous new guard-house which has been built close to the White Tower, and unfortunately announces further acts of vandalism proposed by the War Office. "It has been determined to build stores on the Queen's gardens, and consequently the loopholes in the old Ballium wall will be blocked up. The site will thus be lost for further investigation, and as the Office of Works has no power to prevent these works being carried out, all that has been exposed of one of the most interesting portions of the older part of the Tower will be lost." It is high time that the military should be bundled out of the Tower neck and crop. As an historical relic the Tower is of the highest importance; as a barrack and a fortress it is neither suitable nor necessary. Each year sees the policy of exclusion more rigorously carried out: not a quarter of the buildings open to the public twenty years ago can now be seen by visitors, who will soon be

restricted to the cloak- and refreshment-rooms—mediaeval relics it is true, but not quite so interesting as the buildings beyond. If Lord Ronald Gower's book can draw the attention of Parliament to the further vandalistic changes proposed it will have an additional merit to that of being an eminently readable history of the Tower.

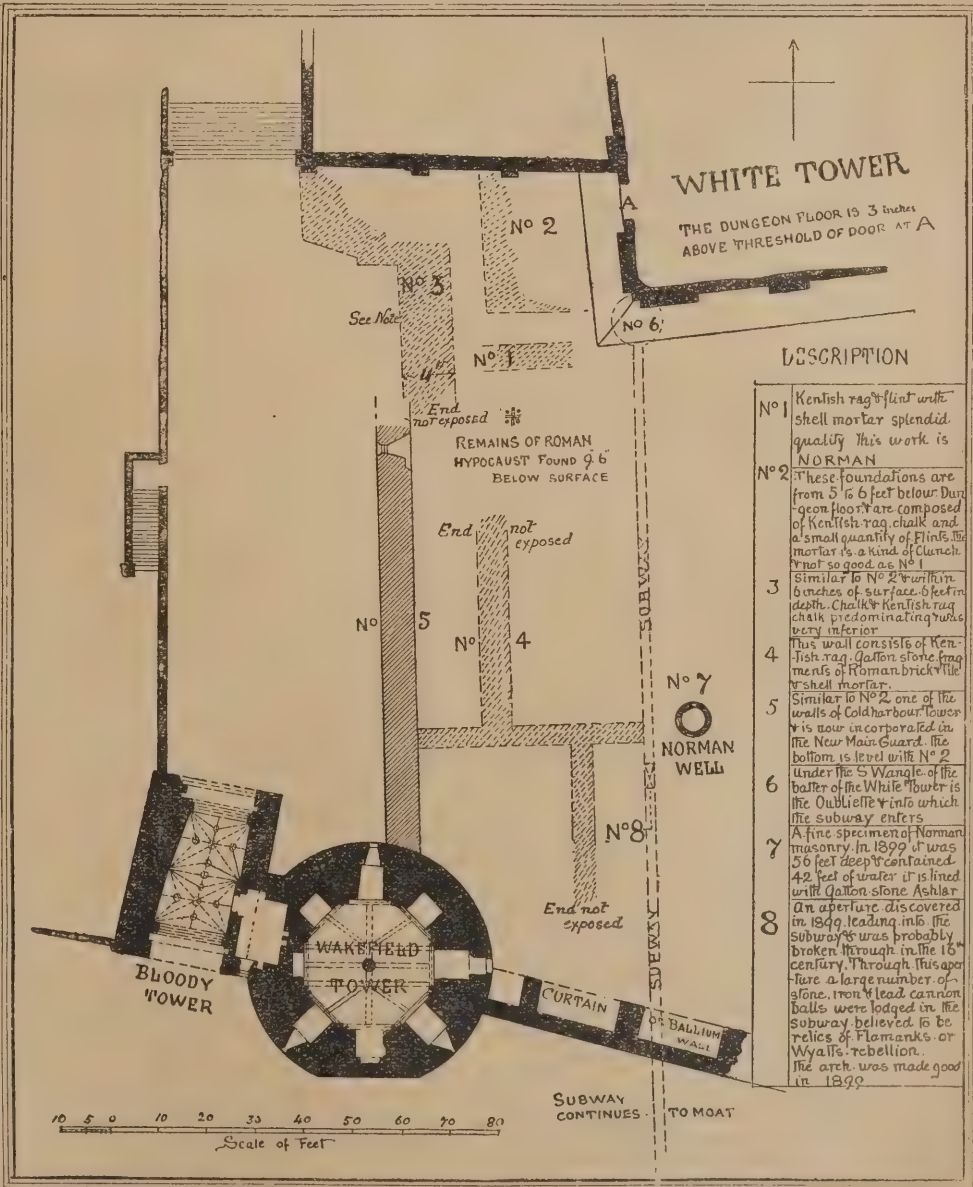

"The Tower of London—Vol. 2." By Lord Ronald Sutherland Gower, F.S.A. London: George Bell & Sons, York Street, Covent Garden. Price 21s. nett.

Masters and Men.

Birmingham Building Trade Dispute.—A committee appointed by a general meeting of the Birmingham Master-Builders' Association last week met the several branches of the operatives in consultation. Mr. Albert Smith (president of the Birmingham Master Builders' Association) acted as chairman, and representatives of the bricklayers, carpenters, masons, labourers, plasterers and plumbers were in turn interviewed. The masters proposed to reduce the masons' and plasterers' wages 1d. per hour, and reduce all other branches of the trade to 9d. per hour. In addition they asked for a uniform hour for beginning and ending work. A prolonged discussion took place upon the proposed alterations in the working rules, with the result that, with the exception of one or two points, the settlement of the matters in dispute was agreed to. As it is not proposed to reduce the existing rate of wages, it is confidently anticipated that no difficulties will be raised by the operatives to prevent a friendly settlement.

CORONATION DECORATIONS.

ON the suggestion of Sir L. Alma Tadema, R.A., who was called in consultation by the Westminster Council Committee, Mr. Frederick Vigers has been appointed to carry out the scheme of decorations for that city. It will depend upon the response which the appeal now being made for funds meets with whether Mr. Vigers's scheme can be carried out in its entirety, but in a rich city such as Westminster, and for such a purpose, it is scarcely conceivable that ample means will not be forthcoming. For the bulk of the route Mr. Vigers suggests an avenue of Venetian masts to be joined together by wreaths of red roses, with leaves and red celluloid balls, and bound together with yellow ribbons. The immediate neighbourhood of the Abbey will be fronted by columns painted white, each furnished with a trophy of his Majesty's arms surrounded by the Ribbon of the Order of the Garter, and ensigned with the Imperial crown. The columns will be connected by wreaths bound with white ribbon, and at the top of each, on a mound of blue glass, to contain electric lights, will be a golden winged figure playing a musical instrument. A notable part of the plan is the erection of triumphal arches representing Great Britain and Ireland, India, Canada, Australasia and Africa at various points on the route. The first will represent the Royal Family of England, by means of his Majesty's Coat of Arms set in a trophy of the banners of the Princes of the Blood; and Great Britain and Ireland by shields emblazoned in their heraldic colours. Figures of the patron saints will surmount the whole, which is to be draped with a golden cloth *sémé* of his Majesty's cypher in red.

PLAN OF CRYPT.

PLAN OF CHURCH PROPER.

CHURCH OF THE SACRED HEART, MONTMARTRE, PARIS.

THE CHURCH OF THE SACRED HEART, PARIS.

ADDITIONAL NOTE.

[As stated on p. 82 of our last issue, at the moment of going to press we received from M. Henri Rauline some additional particulars and illustrations of the Church of the Sacred Heart, Paris. These are now given.—ED. B. J.]

THE decision to erect at Montmartre the Church of the Sacred Heart was made on July 23rd, 1873, soon after which a competition among French and foreign architects was held, and the design of the late Paul Abadie was accepted from among those of seventy-eight competitors. The official ceremony of laying the foundation-stone took place on June 16th, 1875, and the work was begun in earnest a few weeks later. The nature of the ground, which consists of superimposed layers of clay, chalk and sand, made it very difficult to secure good foundations for the building, and in order to avoid any subsidences, which would have been fatal, eighty-five shafts were sunk to a depth of 34 metres below the level of the lower church, resting on a very thick layer of gypsum. These shafts, which were from 3 to 5 metres in diameter, were built up in rough masonry, with hydraulic lime, the total contents being 40,000

cubic metres. At the top the shafts were connected by large arches, on which the church rests; in addition to which the central shafts receiving the weight of the great dome were further strengthened by a bed of concrete 1 metre 20c. thick.

The church consists of two parts, the basilica proper and the crypt, the latter extending entirely under the former, so that its plan is practically the same. The crypt, which is 9m. 60c. high to the top of the vaulting, is largely lighted by windows overlooking a cutting which has been made all round. The basilica is 100 metres long and 50 metres wide, with a cupola in the centre 16 metres in diameter, at the rear of which the choir extends in a semi-circle: both having side aisles on which the chapels open. Between the chapels three large galleries are arranged on the principal axes of the building. The belfry is situated at the end of the church, above the Chapel of the Virgin, and is entered from the principal axis.

The dome, which is the only part of the building really complete, is circular and rests on four piers 14 metres 50c. high, spaced at 16 metres and tied at the upper portions by great arches of 8 metres radius, the whole forming a regular square. Above the four pendentives is the drum of the dome, or tholobate, consisting of two parts or stages. The triforium is 5 metres 40c. high and is

formed of twenty bays opening on to the interior by wide arcades. This is surmounted by a second gallery 7 metres 30c. high, lighted by twenty spacious windows pierced through the exterior wall. Lastly, comes the conical vault (or ovoid rather), the crown being 54 metres above the floor of the church. Outside, at the springing, there is a colonnade 3 metres 50c. high, while above is a lantern 17 metres high, the top of which is 83 metres from the ground, or 124 metres from the bottom of the foundations. The construction of the dome offered a problem rarely set for solution. The majority of cupolas are constructed with light materials bound by strong iron bands so as to neutralise the oblique thrust. At Montmartre, on the contrary, every part is constructed of stones carefully dressed and fitted together. This method is much more scientific than the other, though it has the disadvantage of not resisting the oblique thrust, which has to be neutralised by a careful distribution of the weights and thrusts. Besides, as the tholobate consists of twenty bays supported by relatively slender columns, it has been necessary to determine exactly the direction of the line of pressure in order to assure the stability of the building, the architect having calculated the weight of all the stones in the dome, their form often being dictated by the precise requirements. As a matter of fact, the four piers of the dome support a weight of

36 kilogrammes 210h. per square centimetre at the floor-level of the church proper. At first sight this may seem enormous, but when it is considered that the stone in the piers would only crush at a pressure of 850 to 1,300 kilogrammes, there is no fear when the pressure does not amount to more than 83 kilogrammes. The stone used is that of Souppes, a small district in the Department of the Seine and Marne. It is transported to Paris by boat. The founda-

tions were begun in the autumn of 1875 according to the plans of the late M. Abadie, who directed the work up to the time of his death in August, 1884, at which time the walls had not reached more than a dozen metres above the floor of the basilica. An interval of some months elapsed and the works were then placed under the control of M. Laissée, Professor of Architecture at the Ecole des Beaux-Arts, and of M. Henri Rauline, a pupil of the late M. Abadie

and his colleague from the first at Montmartre. M. Laissée died in January, 1891, and the work then rested solely with M. Rauline. At the present time the building is far from finished: among the chief work still to be done is the belfry, which, according to the new designs, will be 120 metres high. The interior decoration and finishings have scarcely been begun as yet. Much time and much money are still needed before this great cathedral will be complete.

CHURCH OF THE SACRED HEART, MONTMARTRE, PARIS.

ACETYLENE GAS GENERATORS.

THE following are some additional particulars of the report on acetylene gas generators recently issued by the Home Office, and referred to on p. 79 of our issue for March 19th:—

The forty-six different generators tested can be divided into three classes:—(a) Non-automatic, (b) automatic carbide to water generators, and (c) automatic water to carbide generators. In the first class ten generators were submitted, eight of which, however, failed to come within the standard of efficiency considered safe by the Committee, namely, 90 per cent. of the possible yield of carbide. The remaining two, which came well above the limit, were

"The Ideal" (99.80 efficiency).

"Willey's No. 2" (96.15 efficiency).

With this type of generator a storage holder is necessary of sufficient capacity to take up the total yield of gas from the carbide, and in this respect it differs from those of the automatic class, which are intended to generate the gas as required for consumption.

English inventors appear to have found the automatic carbide to water problem a difficult one to cope with, though the system is largely adopted on the Continent and in America, as only six generators of this class were submitted, and four failed to reach the standard of efficiency laid down by the Committee. The machines which passed satisfactorily were

Strode's "Perfect" (94.72 efficiency).

"Hesperus," portable (94.28 efficiency).

The great advantage of the carbide to water generator, properly constructed, is the purity of the gas generated and the absence of after-generation, which, next to absolute safety, are the chief essentials of good acetylene gas generators.

Twenty-nine firms were represented in the water to carbide class, sixteen with generators having an efficiency of 90 per cent. and more, and thirteen whose generators did not reach this. The following were the sixteen:—

	Efficiency per cent.
1. "Sunbeam" -	99.39
2. "Economic" -	98.8
3. "Gregory Smith No. 1" -	98.8
4. "Allen" -	97.59
5. "Moss's" -	97.54
6. Strode's "Portable" -	97.52
7. "Sir Charles Forbes" -	97.05
8. S. C. "Sovereign" -	96.85
9. "Auto-Simplex" -	96.74
10. "Imperial" (1 lt.) -	96.00
11. "Owens" -	95.04
12. "Howe & Colonial, No. 2" -	94.31
13. Rosco "Automatic" -	91.46
14. Salisbury "Bleriot" (motor lamp) -	90.47
15. "Leading Light" -	90.20
16. Read Halliday -	90.00

The efficiency in some instances was under 70 per cent., and it is difficult to account for a loss of over 30 per cent. of the total yield of gas. It would have been interesting to know something of the conditions under which the machines were tested; for instance, the amount of carbide with which each machine was tested, the number of hours each machine was run, the purity of gas generated, and whether any generators were tested with purifiers attached.

The low efficiency in a good many instances may have been caused by a purifier which not only took the impurities out of the acetylene but evidently took out part of the gas itself. Water absorbs acetylene gas, 1 cub. ft. of water taking up 1 cub. ft. of gas, and consequently machines having a great bulk of water would show a low efficiency until the water became saturated with gas, when the absorption would cease, except when the pressure in the apparatus was high, when there would always be a certain diffusion of gas from the water into the air.

The Committee give in an appendix the various conditions which a generator should fulfil to be considered safe, which may be summed up as follows:—

1. Low temperature.
2. Efficiency 90 per cent.
3. Gas pipes to be of full size.
4. Complete decomposition of carbide in the generator.
5. Low pressure.
6. Absence of impurities.
7. Precautions taken against freezing.
8. Lime sludge not to have access to gas or water pipes.
9. Glass gauges to be avoided.
10. Air-space as small as possible.
11. Copper parts to be avoided.

A great deal of harm has been done to the acetylene industry by the cheap and imperfect machines put on the market in the early days, and also by

the unskilled manner in which installations have been fitted up; but with a good generator, properly fitted pipes and properly constructed gas fittings the installation can be made a perfect success. As compared with other lights, with calcium carbide at £20 per ton the cost is no more than coal gas at 4s. per 1,000 cub. ft. Calcium carbide can be produced on the Continent and in America at about £12 per ton, and there is every prospect of the production in England being cheapened, in fact a considerable reduction in the price has just been made.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Adjoining Plots: Footings, Rights of Light.

BUILDERS' JOURNAL writes: "A bought a plot of land from B, who has other land adjoining the plot. When A staked out an external wall he gave notice to B, who objected to the footings projecting on to his (B's) land: B also objected to windows being put in this external wall; there is no mention of these points in the agreement; and on the plan of the land there is marked 'proposed road' along this boundary. (1) Are footings as proposed by A legally in order, and, if notice has to be given to B, how long will it be before A can proceed to build? (2) Is A entitled to build windows in the external wall (they would be glazed with opaque glass)? (3) If the 'proposed road' were formed as shown, would this have made any difference to the right of light?"

(1) Within the Metropolitan area A may legally construct the projecting footings of an external wall upon his neighbour's property, if necessary, but no similar legal right exists in other parts of the country unless specially obtained. The London Building Act of 1894 (57 and 58 Vict., c. 213) states in section 87, clause 6, that where a building owner proceeds "to build an external wall on his own land, he shall have a right, at his own expense, at any time after the expiration of one month from the service of the notice, to place on the land of the adjoining owner, below the level of the lowest floor, the projecting footings of the external wall, with concrete or other solid sub-structure thereunder, making compensation to the adjoining owner or occupier for any damage occasioned thereby." This Act, however, only applies to the Metropolis. The Model By-laws issued by the Local Government Board in accordance with the provisions of the Public Health Act of 1875 (38 and 39 Vict., c. 55) may be taken as representative of the local by-laws ordinarily enforced in connection with the construction of new streets and buildings. Clause 15 of these Model By-laws states that "every person who shall erect a new building shall construct every wall of such building so as to rest upon proper footings. He shall cause the projection at the widest part of the footings of every wall, on each side of such wall, to be at least equal to one-half of the thickness of such wall at its base, unless an adjoining wall interferes, in which case the projection may be omitted where that wall adjoins." Under these circumstances no powers are given to the building owner to construct the footings for his wall upon the property of the adjoining owner. (2) In the case of an external wall built by A wholly upon his own land, he may construct windows therein if he so desires, but at the same time B has power to prevent A obtaining any prescriptive right of light over his property by erecting a hoarding or building a wall upon his own boundary line. (3) The words "proposed road" on the plan apparently have no practical value, as it would appear to be optional with B whether the proposed road is constructed or not. The property should have been purchased upon the expressed and written condition that B should construct the road within a certain period, and thus provide A with a proper frontage towards

it. If there is any doubt as to the actual conditions under which the property was purchased, A should place the matter in the hands of an experienced solicitor. T. E. C.

Right of Way.

REASON writes: "A owns an estate of about ten acres, which he has laid out for building purposes; it was formerly a farm with house and outbuildings, the only road being an old one running through B's (the adjoining owner's) land. B made and drained his old road, and the land on one side has been built upon; but B will not allow a right of way over this road, contending that A's right is only an agricultural one to the farm; and accordingly B locks the gate in his boundary wall. Is he right in doing so?"

If A, as owner of the adjoining house and land, possessed a right of way over the road C, then it is considered that B cannot confine such right of way within the limits mentioned, unless it has been previously specifically laid down in those terms by means of a formal agreement. Under ordinary circumstances it is customary for all rights to go with the land, and assuming that A, being the original owner of the adjacent property, had acquired a prescriptive right of way over the road C, then the purchasers of the land from A have also acquired the same rights. T. E. C.

Buildings in and around Hamburg.

SUNDERLAND.—T. K. writes: "I intend spending two or three days in Hamburg. Which buildings there are worth visiting?"

Hamburg is a large modern continental city, its two principal buildings, the Börse and the Rath-haus, being both of recent erection, and the latter of first-rate importance. The Nicolai Church in the Hopfen Market has the third highest Gothic tower in Europe (473ft.), and the Michaelis Church also has a high tower (426ft.). An architectural student, however, would probably be disappointed with Hamburg, and would do much better to go on to Lübeck, which is only about an hour's run distant, trains leaving Hamburg at 7.15, 8.45 and 10.30 a.m., and returning from Lübeck at 6.47, 7.55 and 9.0 p.m. In this city there is much old work of great beauty, including the cathedral (1170-1341), the famous Hall of the Hausa (now the Rath-haus), the Holsten Gate (Norman), the exquisite mediæval Burg Gate, and the Gothic Marien-Kirche, besides a number of handsome citizens' houses. The best hotel at Hamburg is the "Hamburger Hof" and at Lübeck the "Stadt Hamburg." G. A. T. M.

Duties of Clerk of Works.

SOUTH CROYDON.—H. G. T. writes: "What are the duties of a clerk of works?"

Get "The Conduct of Building Work and the Duties of a Clerk of Works," by J. Leaning, from Mr. B. T. Batsford, 94, High Holborn, W.C., price 2s. 6d.

Surveying.

WIGHT STUDENT writes: "Are there any recent manuals published giving the best methods of surveying houses and grounds with a view to making a plan?"

Consult Baker's "Surveying" (to be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C., price 2s.), and see an answer to an enquiry on measuring buildings on p. 189 of our issue for April 10th, 1901.

Stresses in Roof-Truss.

LONDON, W.C.—STUDENT writes: "Please give stress diagrams of roof-truss shown on the accompanying tracing (not reproduced). Do you think it is of sufficient strength at point A, or does it require to be made wider?"

It is impossible to give a stress diagram for this roof-truss without knowing more about it. There is no apparent reason for the very peculiar shape, and it is much too weak through the part marked A on the long side, which appears to be practically the middle of the span. If it were increased to 18in. deep through A it would then require about 6 sq. in. in each flange. The principal rafter is not only too light but has several purlins with no struts under them.

HENRY ADAMS.

WEATHER-TIGHT WINDOWS.*

By B. M. WARD.

WHICH are the best methods of preventing windows leaking (water and air) under strong and prolonged pressure of wind and rain?

That is the subject of my paper, which is not meant to instruct you, but to draw out the ideas and opinions of those present. I want to know what is to be done to keep a window weather-tight under the most extraordinary conditions.

In the first place let us consider the junction of the frame and the brick- or stonework at the jambs, head and sills. Bed the frame in hair-mortar, you say. Is this sufficient, especially if the bedding is not very well built? It is very difficult to bed a frame really well. Moreover, under the varying temperatures, this bedding draws away either from the frame or from the brickwork (or stonework); little cracks occur; then in a big storm the wind, if prolonged, will force water through, and the trouble has begun.

Put a weather-bar between the sills (see *eee*, sheets A, B, C)? Good; but what about the jambs, to say nothing of the head? Here crops up the question as to whether the window-frame should be fixed in front of, or behind, a reveal. In this there is plenty of food for discussion. I leave the meal to you.

I have not seen the idea exploited, but it seems to me that a metal tongue for stone, or a cement roll for brick, terra-cotta or concrete, would be a good thing (*d, d, d* in sheets A, B and C). In my opinion the weather side of the metal bar or cement roll would be better exposed to the weather and air (A and B; *d*), and I think the same would apply to the sill weather-bar (B and C); even if the bar or roll were omitted, the mere grooves would be helpful as "air-hollows." This arrangement of the bar or roll would be of very little value if the frame were in front of a reveal. I have also shown a further groove in the solid frames (*fff*, A, B and C), and this serves a double (or triple) purpose. It forms an emergency air-cushion, preventing the further ingress of forced air; it exposes more of the frame itself to the air and so lessens the chance of rotting; and thirdly, by its use less of the girth of the frame comes in contact with the bedding, itself an inducement to rotting; moreover, in this connection the smaller the amount of contact between frame and bedding the better the chance of the bedding being made even and homogeneous.

I have also shown (*ggg*, A, B and C) "the break-water feature" of Mr. Campbell Douglas, advocated in an article of his in "Specification." I have slightly modified it. Mr. Douglas maintains that the fury of the storm will expend itself on this fillet, and only a weak edition will be left to tackle the joint between frame and brickwork. Moreover, I have shown in most cases the frame-sill throated and projecting over the stone sill, the weathering of which is taken back behind that throat (*l, l, l*, A, B and C), another suggestion by Mr. Douglas.

To come, now, to the different types of windows. First, sash windows. These, as generally constructed, keep out the water fairly well, but for incessant rattling in a wind, just when you want to go to sleep, nothing can compete with a sash window. The sashes have shrunk in thickness, and there is now unnecessary space for them between parting slip and lining or bead. Slips of oak or felt or leather (*h, h*, sheet A) fixed to an existing window might stop the rattle. If they did, they would prevent the sashes being opened, so you might as well screw the sashes up altogether. However carefully the sashes are made, however well seasoned the wood may be of which they are made, either they will rattle or they will not slide (at least after rain). The great thing is to press both sashes tight against the parting slip. It struck me the other day that the slope of the sill would help the lower sash to hug the parting bead if the sash could be constantly pressed down, and the slope made steeper than usual (*j, A*); similarly a fillet (*k, A*) in the head would help the upper sash if constantly pressed up. All we want, now, is a wonderful fastener which will, at one and the

same time, push down the lower sash, push up the upper sash and pull the meeting-rails tight together. Whether these particular sections of bead and sill are valuable or absurd, the type of fastener I have described would be a useful addition to any existing window.

But all this means a window shut tight—an abomination, at least in a bedroom. However, fairly large slots in the meeting-rails, which could be closed with little shutters, might be adopted. I have shown a great number of "water hollows" (as they are called; "air hollows" would be a better word—*m, m, m*; A, B and C). These help considerably in keeping out draught and the weather generally. Any wet that gets to them is carried down at once in the case of jambs, gets down as soon as it can in the case of sills, while in the heads it slips out of the holes drilled for that purpose.

boxes. All this is very true, I think; but Mr. Douglas does not say how he stops the feet of the jamb-boxes, to prevent them rotting in their most susceptible part. I have shown a block under the feet, though I do not think it would answer very well; so I rather suggest the other sill, which provides little more contact with the bedding. This would be better, to my mind, if the weather bar were exposed (as in B and C). The tall fascia in front of the bottom rail allows, of course, the bottom sash to be raised for ventilation through the meeting rails, without causing draught below. The shape of the fascia provides an emergency air-cushion at *n*, and lessens the risk of the fascia and bottom rail sticking together.

So much for sash windows. Of casement windows with the lights hung at the side and opening out, there have been suggested so many

The greater object, however, of these hollows is the air-cushion which they form. This prevents forced air from making any progress. Those air hollows marked *n, n, n* on sheets A, B and C are emergency hollows, so that in case of bad fitting the winds that escape through "*m*" may be stopped by "*n*."

I have shown two different sections of sill in sheet A. That marked *P* is Mr. Campbell Douglas's section. He says that the wide sill, usually prescribed, is very liable to rot; will only allow a very gradual slope unless it is considerably deepened; that the wet remains on this gradual slope in a wind, and blows up under the sash; that the wide bedded portion all unventilated is conducive to rot; that the weathering of the stone sill under and behind a throat in the frame sill is a great improvement, and so on. He says, too, that he finds there is no need to stay the outer parts of the feet of the jamb-

sections of bottom rail and sill, and so many plans of jambs, most of which have their good points, that it is difficult to know which is the best. That marked *J, J, J* on sheet B seems to me to be good enough. There is little doubt that rebated rails in a casement would be a great advantage if they could only be made quite certain of fitting well to the frame and yet without danger of sticking. In this case (*J J J*) there is always an emergency airhollow, *n, n, n*; *K* is a usual section; *Q* can only be applied to the hinged side, of course; *K* would do for the other; *R* would be good if the fitting could be guaranteed—the splays lessen the chance of sticking; *K, Q* and *R* are all copied, and so are the sills marked *S*, of which *Sa* seems about the best. The mullion *T* is also copied, and looks satisfactory, though I personally should always feel afraid of the rebates. All these details (sheet B) would equally apply to a fanlight

* A paper read before the Liverpool Architectural Society on March 3rd, 1902.

CASEMENT WINDOWS
OPENING OUT.
SHEET B.

hung at the top, except that Q could only be the head.

Wood casements hung at the side and opening in are more difficult to make weather-tight. It seems necessary to call in the use of metal in some shape or form in order to make a really satisfactory arrangement. Here I may mention that before writing this paper I thought it would be a good thing to get the opinions of some of the local joiners and contractors on the whole subject of weather-tight windows. I therefore wrote to five or six prominent firms, but only received replies from two. One said they could give me no information; the other, Messrs. William Tomkinson & Sons, were good enough to send me a pamphlet on Elliott's fitting to wood casements opening in, saying that they had always found them satisfactory.

In the section of sill marked J (sheet c) I have shown Elliott's metal channels, for I cannot think of anything better. It would be unpleasant for anyone to lean the elbow on them if thinly clothed, but otherwise they would be very satisfactory. Between the jambs marked J I have shown a plan of hooked meeting-rails; the right-hand jamb has obviously no connection with these meeting-rails.

K, K are plans of jambs for one window with metal bars. These would be very satisfactory if well fitted. Q, Q are sections of sills often used, and here copied.

For fanlights hung at the bottom, the left-hand jamb (the hinged side) of J and K would not apply, but the other jambs and heads would; and for the bottom rail that on the transom R would, I think, do well enough.

Fanlights hung at the centre (horizontal centre) can, I suppose, never be made quite weather-tight, especially at the centre; S and T show ordinary methods. It is better, if you must have a fanlight hung at the centre, to have it of iron, as there is then less unrebated portion at the centre.

In the plans of jambs, S and T, I have shown the beads *n, n* solid on the jambs: a joiner would

much prefer these to be planted, but I think it is worth the extra expense to have them solid.

With regard to casements revolving at their vertical centre, Captain Chaddock has very kindly brought his model here. There ought to be the making of a really weather-tight window in this invention, though it is really intended for a bulkhead door in a ship. The window need not revolve on its exact centre at all; it can have the greater part to go out, or to come in, and also can be swung back into the room, the reverse side in, so as to be cleaned with safety.

With regard to iron casements, I only want to ask how long they will keep weather-tight. The manufacturers invite you to play a fire-hose on one of their windows and guarantee there shall not be a drop of moisture inside as a consequence. But this is with a newly-fitted window. I want to know how weather-tight they are after they have been slammed many hundreds of times and after they have been subjected to the extremes of temperature for, say, twenty years.

I have touched on most of the varieties of windows usually specified, and I am not going to speak of any other kinds.

The general arguments against nearly every section and plan I have advocated are complicatedness and expensiveness. With regard to the former, the golden rule that the simplest is the best seems not to apply here at all. Simple splays and simple joints will not do the work required when under the severest conditions. With regard to expensiveness, I have purposely had no regard for expense. We want to know what is the best; we already know what is the cheapest. Still it does seem absurd that we should have to be always hacking out little air-hollows here, there and everywhere, and inserting little metal tongues and channels, and always we are fearful that the joiner will not make a perfect fit, or if the fit is perfect at first we know that the wood will shrink if it has not been well seasoned, or worse still, we know that if it has been well seasoned it will swell in wet weather.

Yet another point. I have so far spoken of

"weather" either as wet or as draught. There is a third feature of weather—temperature. A window ought to keep out the cold and keep in the heat. Make your window never so water-tight, never so air-tight, one thickness of glass will not keep in the heat or keep out the cold; not even plate glass $\frac{1}{4}$ in. thick.

While preparing this paper I have come more and more to the conclusion I arrived at years ago, that this country of ours, with its "climate of samples," requires the almost universal adoption of *double windows*: double casements or sashes, with single or double frames. In Canada, I believe, they go further; they screw up their double windows inside and out during the winter, and provide for the ventilation (or perhaps they don't) by other means.

With double windows *simple* details will be quite good enough; the space between the sheets of glass is a splendid air-cushion, stopping wind coming through, and as for the heat and cold I suppose there is not a better non-conductor of heat than a mere layer of air. I am told that two sheets of glass with the air between them are as efficient as a 9 in. brick wall, and that a single pane of glass has rarely 25 per cent. of that efficiency. As regards light, two clean panes of glass stop less light than one dirty pane; though that is not meant for an argument. I ask you, finally, are not double windows the best of all; and if not, why not?

"The Villages of Port Sunlight and Thornton Hough."—Mr. W. H. Lever read his paper before the Liverpool Architectural Society last week.

Home Arts and Industries Association.—The eighteenth annual exhibition of work done in the classes of the Home Arts and Industries Association will be held from May 29th to June 2nd in the Gallery of the Royal Albert Hall. The exhibition will include specimens of homespun and linens, modelling in terra-cotta, metal repoussé, woodcarving, inlay, stencils, lace, knitting baskets, rugs and toys, and of other arts and industries.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Do you seriously mean," broke in Allen, a little impatiently, "that it is a thing to wish for and to look forward to, that we should abandon all attempts at original architecture, and content ourselves with simply sponging on the past?"

"I do," replied Mr. Rose suavely; "and for this reason, if for no other, that the world can now successfully do nothing else. Nor, indeed, is it to be expected, or even wished, that it should."—W. H. MALLOCK, in "The New Republic."

Our Plates.

WESTMINSTER COLLEGE, CAMBRIDGE, is a new college

which has recently been erected for the Presbyterians. The College proper is T-shaped on plan and contains four classrooms, a common-room, and eight bedrooms and eight sitting-rooms on the ground floor, with lavatories, &c. Above are other bedrooms and sitting-rooms. At the lower end of the T are arranged the dining-hall and library and the principal's residence, the latter fronting on the road. At the rear leading from the dining-hall are the kitchen, scullery, servants' hall, &c. Mr. Henry T. Hare, F.R.I.B.A., is the architect.—We illustrated the exterior of Giggleswick School Chapel, Settle, and the construction of its dome, in our issue of September 11th last; particulars of the building were published on p. 74 of that issue, and on p. 546 of our issue for August 14th, 1901.

The New R.A.

On Wednesday last Mr. G. J. Frampton, Associate, was elected an Academician in the place of the late Mr. T. Sidney Cooper. In the final ballot Mr. Frampton received twenty-six votes to twenty given to Mr. Waterlow, the landscape painter. Mr. Frampton, who lost the January election to Mr. Bodley by one vote, received his early training at Lambeth, and subsequently became a student of the Royal Academy, where he

carried off the gold medal and travelling studentship in 1887 with a modelled group illustrating "An Act of Mercy." Later he continued his studies in Paris under MM. Mercie and Dagnan Bouveret, and in the studio of Sir Edgar Boehm. No material seems to come amiss to him, whether marble, ivory, silver, or gold: he has carried out work on the largest and boldest scale, and yet he can adapt himself on occasion to the craft of the jeweller. He is one of the most distinguished of the group of artists to whose efforts we owe the renaissance of sculpture in England, and no one who has studied Mr. Frampton's work during the closing decade of the last century was surprised that at the Paris Exhibition of 1900 he was awarded a grand prix, the greatest honour that can be bestowed on an artist in Paris. He has done much architectural sculpture of very high rank, and is a co-director with Mr. Lethaby of the L.C.C. Arts and Crafts School, in Regent Street, W. Mr. Frampton was elected an A.R.A. in 1894, and lately he has been chosen as the Master of the Art Workers' Guild. He married an artist, and his wife, Miss Christabel Cockerell, is a frequent exhibitor of portraits and subject pictures at the Academy and the New Gallery.

Mr. Belcher and the New Government Offices.

MR. JOHN BELCHER, A.R.A., observes in a letter to the "Times" that many persons are anxiously awaiting the report of the advisory committee appointed to consider the completion of the new Government buildings designed by the late J. M. Brydon. Mr. Brydon told Mr. Belcher that there were many things he intended to revise when working out the details. "One alteration which I learn is proposed would not have met with his approval, the substitution of a flat for the low roof provided in his design; for the effect of the balustrading against the open sky produces an entirely different one from that against a dark roof. If a flat is required, it should be at a higher level, and it is exactly these subtle points which require consideration. These the advisory committee

may fairly be asked to grant the public some assurance will be adequately dealt with."

Richmond Hill View.

At a special meeting of the Richmond Town Council a draft agreement provisionally accepted by a committee was submitted asking the council to agree to support the Richmond Hill (Preservation of View) Bill, and enclosure of the Ham lamas lands, in return for some additional concessions of meadow land at the foot of Richmond Hill over and above those originally included in the Bill. The committee have recommended the council to make a further grant of £5,000, making £10,000 in all, towards the purchase of the Marble Hill Estate, for the purpose of protecting the view from Richmond Hill, as, owing to the refusal of the Middlesex County Council, the City Corporation and Hammersmith to support the present scheme, only £54,000 has yet been secured out of the total of £72,000 required. The Twickenham District Council will be asked to double its promised contribution of £3,000 towards the same object.

Some Glasgow Buildings.

A LARGE party of the members of the Edinburgh Architectural Association visited Glasgow recently, and under the auspices and leadership of the Glasgow Architectural Association inspected a number of the more important among recently-erected buildings. The programme was arranged by the president of the Glasgow Association, and among the buildings visited were the Mercantile Chambers, Bothwell Street (Messrs. James Salmon & Son, architects), Waterloo Chambers, Waterloo Street (Messrs. J. Burnet & Son, architects), Savings Bank, Ingram Street (Messrs. J. Burnet & Son, architects), School of Art, Renfrew Street (Messrs. Honeyman & Keppie, architects), Belmont Church (Mr. James Millar, architect) and Stevenson Memorial Church (Mr. John J. Stevenson, London, architect). Several private residences were also visited.

FIREPROOF PARTITIONS.

SOME NEW YORK TESTS.

A VERY interesting series of tests with fire-proof partition materials was recently made under the supervision of the Department of Buildings, New York City. Briefly stated, the purpose of the tests was to record the effect of a fire of one hour's duration, commencing at 500 degs. Fahr. and increasing to 1,700 degs. Fahr., followed immediately by the application of a stream of water from a hose on the exposed side for two and a half minutes; which is a similar method to that adopted by the British Fire Prevention Committee. The areas of the partitions tested were 137.75 sq. ft., with a width of 14 ft. 6 in. and a height of 9 ft. 6 in. The tests were made in a test-house. The following forms of partition were tested:—

Bell Plaster Composition Blocks.—One partition of solid section 2 in. thick and one of hollow section 3 in. thick. The composition of the blocks was plaster-of-Paris and cinders. After the blocks were put in place they were covered with $\frac{1}{2}$ in. coat of "King's Windsor" plaster. Maximum temperature during test, 1,724 degs. Fahr.

Metropolitan Partition.—Solid plaster composition blocks 2 in. thick. The composition of the blocks was plaster-of-Paris, wood chips, cocoa-nut fibre and asbestos. After the blocks were put in place they were covered with $\frac{1}{2}$ in. coat "King's Windsor" browning. Maximum temperature during test, 2,030 degs. Fahr.

Norman Partition.—Solid composition plaster blocks 2 in. thick. The composition of the blocks was plaster-of-Paris and wood fibre. The blocks were fastened together with rods and turnbuckles. After the blocks were put in place they were covered with a $\frac{1}{2}$ in. coat of "King's Windsor" browning. Maximum temperature during test, 1,706 degs. Fahr.

Sanitary Partition.—Solid composition plaster blocks 2 in. and 3 in. thick, fastened together with metal rods. The composition of the blocks was plaster-of-Paris, ashes and a fluid cement. After the blocks were put in place they were coated partly with common lime mortar and partly with Platt plaster. Maximum temperature during test, 1,832 degs. Fahr.

White Partition.—Solid and cellular composition plaster blocks 3 in. thick. The composition of the blocks was plaster-of-Paris, asbestos and wood fibre. The blocks after being put in place were plastered with "Adamant" browning $\frac{1}{2}$ in. coat. Maximum temperature during test, 1,760 degs. Fahr.

Freeman-Dobbin Partition.—Solid and cellular composition plaster blocks, the solid 2 in. thick and the cellular 3 in. thick. The composition of the blocks was plaster-of-Paris, silicate and carbonate of lime and wood fibre. The blocks after being put in place were plastered with a $\frac{1}{2}$ in. coat gauged mortar. Maximum temperature during test, 1,760 degs. Fahr.

Expanded Metal Lath and Plaster Partition.—Composed of expanded metal on 1 in. by $\frac{3}{16}$ in. metal studs at 12 in. centres covered with scratch and browning coats of "King's Windsor," making a total thickness of 2 $\frac{1}{2}$ in. Maximum temperature during test, 1,706 degs. Fahr.

Moeslein Partition.—Metal lath and plaster partition, composed of perforated sheet metal attached to both sides of T-iron studs 1 in. by $\frac{1}{2}$ in. at 11 in. centres, forming an air-space of 1 $\frac{1}{2}$ in. between the metal sheets, covered with "King's Windsor" scratch coat, making a total thickness of 3 in. Maximum temperature during test, 2,021 degs. Fahr.

Roebbling Partition.—Wire mesh and plaster. Composed of two sheets of No. 22 wire $\frac{3}{16}$ in. mesh, stiffened by $\frac{1}{2}$ in. steel rods 7 in. apart attached to 2 in. by $\frac{1}{2}$ in. metal studs, forming an air-space 2 in. wide between the metal sheets, covered on the inside with white putty coat of plaster and on the outside with "Rock wall plaster" to a thickness of 3 in. Maximum temperature during test, 1,994 degs. Fahr.

Roebbling Partition.—Wire mesh and plaster. Construction same as above, but of one sheet of wire mesh on $\frac{3}{16}$ in. by $\frac{1}{2}$ in. channel studs at 16 in. centres, covered with "Acme" patent plaster to a thickness of 2 $\frac{1}{2}$ in. Maximum temperature during test, 1,800 degs. Fahr.

Averill Partition.—Metal lath and plaster. Composed of $\frac{3}{16}$ in. by 1 in. flat uprights at 12 in. centres, fastened top and bottom to $\frac{3}{16}$ in. by 1 in. plates with Schratwieser metal lath on one side. The metal lath was plastered on one side, and the other side was filled in with sawdust and hydraulic cement composition flush with the metal studs. This was then plastered with a scratch and browning coat of sand and hydraulic cement, making a total thickness of 2 $\frac{1}{2}$ in.

Averill Partition.—Sawdust and hydraulic cement composition blocks 2 in. thick, plastered with scratch and browning coat of cement mortar to a thickness of 3 in. Maximum temperature during test, 2,102 degs. Fahr.

Schratwieser Partition.—Metal lath and plaster. Solid and hollow partition similar to other metal lath partitions, plastered with "King's Windsor" asbestos cement to 2 in. and 3 in. respectively. Maximum temperature of test not taken because of accident to pyrometer.

Tile Block Partition.—Henry Maurer & Son. Porous terra-cotta cellular blocks, composed of 12 in. by 9 in. by 2 in. hollow blocks with three air-cells each, the walls of the blocks being about $\frac{1}{16}$ in. thick. In the horizontal joints a metal strap $\frac{1}{2}$ in. wide of No. 24 United States gauge was laid. In another wall 8 in. by 12 in. by 3 in. semi-porous cellular blocks with two air-cells were used without the metal strap. Both partitions were plastered with $\frac{1}{2}$ in. "King's Windsor." Maximum temperature during test, 2,057 degs. Fahr.

Brinkman Partition.—S. G. Brinkman's solid terra-cotta blocks, composed of 15 $\frac{1}{2}$ in. by 9 $\frac{1}{2}$ in. by 2 in. blocks and 16 $\frac{1}{2}$ in. by 10 in. by 1 $\frac{1}{2}$ in. blocks, with a stamped metal I-bar laid in the horizontal joints supported by metal uprights. Each partition was covered with $\frac{1}{2}$ in. of plaster on each side. Maximum temperature during test, 1,706 degs. Fahr.

Concrete Block Partitions.—Sprickerhoff partitions. The composition of the blocks was 1 part Portland cement, 1 part of sand and 5 parts steam ashes, covered with $\frac{1}{2}$ in. coat of "King's Windsor" browning mortar. Maximum temperature during test, 1,863 degs. Fahr.

The result of the tests can be briefly summarized:—

Composition Plaster Blocks.—All the composition plaster block partitions had the plaster coating calcined from their surface, and the body of the blocks was also calcined to a greater or less depth, generally from $\frac{1}{2}$ in. to 1 $\frac{1}{2}$ in., and this portion was washed away by the water. In no case did the fire or water pass through the partitions. It is interesting to note here that had the test been continued for a longer time the whole thickness of this composition plaster would have been calcined and therefore rendered incohesive and soluble.

Metal Lath and Plaster Partitions and Metal Lath and Cement Composition (Averill).—All the metal lath partitions had the plaster or cement composition calcined to a greater or less depth, part of which was washed away by the water, exposing in some places the metalwork. In no case did the fire or water pass through the partitions. The same observation holds good here as in the case of the plaster block composition blocks—that had the fire been continued for a longer time the whole thickness of the plaster would have been calcined and therefore rendered incohesive and soluble, and after this the metal work would have been directly exposed to the fire.

Tile Block Partitions.—Porous and semi-porous cellular terra-cotta blocks. The only effect of the fire and water on the terra-cotta cellular blocks was to remove the plaster coating, leaving the stability of the wall intact and actual material of the block uninjured.

Solid Terra-Cotta Blocks with Exposed Stamped Metal I-Beam Fastenings.—One effect of the fire and water had been to remove the plaster. Another effect was, the metal fastenings were slightly deflected in places. The blocks suffered no injury. In no place had fire or water passed through the partition.

With regard to these tests the "Brickbuilder" of Boston, U.S.A., says:—The result makes one thing very plain, which was already well known to those having an elementary knowledge of

chemistry—that plaster-of-Paris, lime plaster, carbonate of lime, or any of its compounds are not fireproof materials; that at best they are merely non-combustible and cannot resist the action of fire and water either separately or alternately. Therefore any partition depending upon these materials for its structure or its filling cannot be depended upon to endure great heat for any considerable length of time; and any partition whose metal structure is dependent upon an insulation of plaster and its compounds must fail by reason of the destruction of the insulating material and the exposure of its structure to the direct action of the heat. Another result which is also evident is that in the event of a fire not sufficient to totally destroy the plaster composition partitions, the repairs required to restore them to an acceptable condition would amount almost to a virtual replacement of many of the blocks of the block partitions and a refilling of the plaster body in the metal-lath partitions, an item which must be considered in deciding on the relative merits of various materials.

In regard to the tests of the porous and semi-porous tile blocks, the solid tile blocks and the concrete blocks, had the test been carried further—to the point of failure of these two different materials—the result could be predicted almost to a certainty. The concrete blocks probably would have been affected first. The component parts of the concrete having different coefficients of expansion would have been under great strain, and upon the application of water, under the sudden cooling would probably have developed cracks which would have impaired its structure. The calcining effects of the great heat would also have affected the cement to some extent (depending upon the temperature), and this would have impaired its binding properties.

The porous and semi-porous cellular fireclay terra-cotta, being a porous homogeneous material, could have endured a continuous heat short of the vitrification point without any structural disintegration, and could then have passed through the water-test without harm, because its porous structure would have allowed contraction of volume without great strain, as the introduction of pores or minute air-cells into its structure permits sudden contraction without appreciable destructive effects.

All these results are what might have been expected. Fireclay needs no recommendation; its qualities are too well-known to require it. The blast furnace, the steel converters, the open-hearth steel furnaces, and the dome and rotary cement kilns, all testify to the uses to which this refractory material can be put. It is not strange, then, that it endures where other materials fail.

In judging these tests, however, one fact must not be overlooked. All these partitions were without openings and rested upon a brick floor, or on steel members which rested on the brick floors. It is hardly necessary to point out that these conditions were highly favourable ones for the test, but one of these conditions, that of no openings, cannot always be realised in practice. The fact that it cannot be realised, however, makes it highly important that the openings be made as few as possible and that all openings be re-enforced with metal frames covered with insulating material. The partition should be made as independent as it is possible to make it of any required additional stability, but as conditions sometimes make this dependence necessary, the metal frames around such openings should be carefully secured to floor and ceiling and thoroughly protected from sudden changes of temperature. The partition should also rest directly upon and be cemented directly to the incombustible floor material, so that the bond of these two can be depended upon. It is no uncommon thing to see partitions set upon a layer of dust, which of course prevents any possible bond between the floor and the partitions and may cause the partition to fall in case of strain. Partitions set upon wood or other inflammable material cannot be considered as any more than temporary non-combustible screens which may fall at a critical moment.

In conclusion it may be said that the porous fireclay material as a fire and water resisting medium has been proven. Now the fulfilment of its highest function depends entirely upon the intelligent use made of it by the architect and manufacturer.

Builders' Notes.

The Reading and District Building Trades Masters' Association held its annual dinner recently. Mr. J. T. Bottrill presided.

National Registration of Plumbers.—At a public meeting of health and water authorities, architects, members of the medical profession, master and operative plumbers, and others, recently held at the Technical College, Bradford, a resolution was carried expressing the hope that the Plumbers Registration Bill may be successfully passed through its several stages in the House of Commons and become law.

Laxton's Builders' Price-Book for 1902, published by Kelly's Directories, Ltd., has just been issued and is thoroughly revised to date. The memoranda and methods of measurements described at the commencement of each Trade division have been extended in many places. The Electric Lighting section has received special care and attention, and the rules for installations issued by the Sun Insurance Office have wisely been included, as well as those of the London County Council with regard to the protection of public buildings from fire. The notes on law cases affecting the by-laws have been brought up to date.

The **Bradford Master-Builders' Association** held its annual meeting recently, Alderman W. Holdsworth, J.P., presiding. Alderman Holdsworth was re-elected president, with Messrs. Phineas Drake, Wallace Daykin and Angus Moulson vice-presidents, and Mr. W. Moulson, J.P., treasurer. Mr. A. Gadie resigned the position of secretary, and Mr. J. H. Dawson was elected in his place. It was reported that a dispute in the trade had arisen at the electricity works, and that both sides were prepared to refer the matter to a board of conciliation, as provided when the recent dispute came to an end. The following gentlemen were appointed to represent the masters on the board of conciliation, which is a permanent body:—Councillors O'Flynn and Gadie, Messrs. Drake, Moulson and Daykin, with Alderman Holdsworth president.

Mr. W. Fassnidge, builder, of Uxbridge, died recently at the age of seventy-six years. He had been associated with the building trade, and especially ecclesiastical building, for upwards of half a century. In fact, it is over fifty years ago since he restored Hillingdon Church, which work he accomplished in 1851, and which was the start of the restoration movement in the district. Since that time Mr. Fassnidge built St. Andrew's, Hillingdon West, in 1864. He also built Iver Heath and Yiewsley churches, restored Uxbridge Parish Church in 1870, restored Denham Church, built Denham rectory and restored Watford Church. He had also undertaken the restoration of other churches in the various villages surrounding Uxbridge, and had done other similar works elsewhere, notably the restoration of Chalvey Church, Slough. One of the most recently completed works of Messrs. Fassnidge & Son was the Jewish Working Boys' Home at Hayes, which was opened not long ago by Lord Rothschild and is the first establishment of the kind in England.

London County Council.—At last week's meeting of the Council the sum of £56,151 was voted for the erection of working-class dwellings on Preston Road and Norfolk Street sites, Poplar. It was decided to acquire at a cost not exceeding £165,000 the freehold and other interest in the properties on the west side of Southampton Row, between Vernon Place and Bloomsbury Place, for the purpose of widening Southampton Row to 80ft. In reply to Mr. Foster, Sir Algernon West said the regulations submitted in regard to electric lighting and heating arrangements at theatres, houses, rooms and other places of public resort would only apply to new buildings. The sum of £20,000 was voted as five-sixths of the nett cost of widening the Strand to 80ft. at Nos. 91, 92, 93, proposed to be undertaken by the council of the City of Westminster. The improvement deals with the block directly east of the Strand frontage of the Hotel Cecil. The consideration of the report of the Building Act Committee dealing with the name of the new street from Holborn to the Strand was adjourned. Lord Welby said he believed the Boadicea statue for Westminster Bridge would be in position by the time of the Coronation.

Keystones.

The Queen Victoria Memorial Fund now amounts to £191,730.

Mr. Alfred Gilbert's House in Maida Vale, specially designed and built for him, is to be sold by auction this month.

A **Stained-Glass Window** has been placed in at St. James's Church, Doncaster. The window has been supplied by Messrs. Heaton, Butler & Baines, of London.

Enclosure of Stonehenge.—A committee sat last week at Salisbury to enquire into the enclosure of Stonehenge and the alleged obstruction of public rights-of-way leading to it. The Committee will in due course report to the Wilts County Council.

Lancing College.—It is proposed to construct the groined ceiling of the sanctuary of Lancing College as a memorial to the Rev. Edmund Field, and the chapel is to be completed. The cathedral-like chapel was designed by the late Mr. Carpenter, who built several fine churches in London.

Memorial Church, Mandalay.—A new church in memory of Queen Victoria, Kaiser-i-Hind, which has been erected outside the fort and in close proximity to the Residency at Mandalay, has been consecrated. It is a cruciform structure of brick, and may be described as Gothic in its architecture.

Notice.—The publisher of THE ARCHITECTURAL REVIEW (Effingham House, Arundel Street, Strand, W.C.) will be glad to send a copy of the March or April issue of that publication in exchange for a copy of the January number. He will also be glad to send a copy of the current issue in exchange for a copy of the BUILDERS' JOURNAL for February 13th, 1901 (which is out of print).

Clare Lunatic Asylum Ireland, which was built thirty-five years ago, is to be enlarged. Applications for the position of architect were invited, and Mr. Francis O'Connor, M.S.A., of Ennis, has been selected to prepare the plans and superintend the erection of the buildings. The new buildings will accommodate 400 chronic patients, who are now housed in the different workhouses throughout the county. The estimated cost of the proposed works is £35,000.

The Municipal Hall, Public Library and Technical Schools at Colne, erected by the Corporation at a cost of £10,000, was opened recently. The buildings have a main frontage to Albert Road. The public hall (which will seat a thousand persons) and library are approached by the elevation to Albert Road, and the technical schools occupy the rear portion of the building, which has a very commanding site and is erected from the designs of Messrs. Woodhouse & Willoughby, architects, of Manchester.

The Series of Mural Paintings covering the arches of six chapels recently brought to light through the energy and artistic zeal of M. Celles, the new curé of the parish of Saint Nicolas des Champs, Paris, continues to attract much attention. Till now these paintings have been hidden by whitewash, and it was left to M. Celles to clean and revive them and to discover their historical interest. They are dated 1623, an epoch which is somewhat neglected in French art history. The best known names of that period were Simon Vouet (born in Paris in 1582, died in 1649) and Quintin Varin, a contemporary. These large paintings, though they recall the Italian school, are vigorous and full of talent.

Mr. William Watkin Williams, architect, of Swansea, died recently at the age of thirty-eight. He was at one time a working mason, having been apprenticed to Messrs. Walters & Johns, builders, Morriston. He was a student at the Swansea Art School under Mr. F. F. Hosford; he designed the plans for very nearly all the new chapels in the district, among them being Capel Henrietta and Hill Chapel, Swansea, and a very large number in the Swansea Valley. At the present time his staff are engaged upon the English Wesleyan Chapel, Clydach, and Seion Chapel, Gorseinon. In addition to this the deceased prepared the plans for many schools, including the Wern School, Ystalyfera, the Alltwen Schools and the Pontardawe Schools.

The Roof of Penn Parish Church, Bucks, being in a dilapidated and unsound condition, is proposed to be repaired. The tower also needs attention.

Change of Address.—Mr. Robert J. Beale, architect and surveyor, has removed his offices from Broadway House, Westminster, to No. 17, Old Queen Street, Westminster.

Exeter Old City Wall.—It is distressing to learn that a large portion of the old City wall at Exeter has been taken down at the end of Fore Street.

The Scenes of "The Girl from Maxim's," the new play at the Criterion, have been furnished by Messrs. Oetzmänn & Co., of Hampstead Road, W. They show us a cosy substantial study in old oak and tapestry, and a room with gilt furniture and blue silk brocade, in a beautiful old château in Touraine.

Brinkworth Parish Church is being restored. Mr. Kite is the contractor. Under the wooden flooring was found a fragment of carved stone, which the architect (Mr. C. E. Ponting) thinks is the rim of an ancient Saxon font—a proof that on the site of the present edifice a Saxon church had existed.

A **New Weir** at Penton Hook, near Chertsey, has been completed by the Thames Conservancy, and is now in working order. The building has a covered-way roofed with shingles, and the water-controlling panels are raised or lowered by shafting. A gauge weir is also in course of construction lower down the river, and the channel in the vicinity of the locks has been deepened.

The **Southern Annexe of Manchester Cathedral** is to be completed so as to provide a new library and vestries for the choir and clergy, and to restore to the area of the cathedral the Jesus or Byrom Chapel at present screened off and used for the above purposes. The work, for which about £3,000 will be required, will be a memorial of the late Sir J. W. Maclure, M.P., who was the means of raising between £30,000 and £40,000 for the restoration and enlargement of the cathedral.

COMING EVENTS.

Wednesday, April 2.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Meeting at 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. James Millar, I.A., on "The Glasgow International Exhibition of 1901," 8 p.m.

Thursday, April 3.

CIVIL AND MECHANICAL ENGINEER'S SOCIETY.—Mr. E. Ault on "Ventilation of Sewers," 8 p.m.

Friday, April 4.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. E. Worth, M.I.O.E., on "Sewerage."

INSTITUTION OF JUNIOR ENGINEERS.—Mr. G. Drysdale Sweetman on "Notes on Modern Lighthouse Construction," 8 p.m.

Saturday, April 5.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to the Lauder Technical School, Danfermline.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Meeting at Carpenters' Hall, E.C., at 6 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Inspection and Demonstration at the Sewage Outfall Works, Barking, at 3 p.m., conducted by Mr. John E. Worth, M.I.O.E.

GLASGOW TECHNICAL COLLEGE SCIENTIFIC SOCIETY.—Annual General Meeting at 7.30 p.m.

Monday, April 7.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. E. Worth, M.I.O.E., on "Sewage Disposal," 7 p.m.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. W. Aumonier and Mr. Heywood Sumner on Inlay and Marquetry," 8 p.m.

SOCIETY OF ENGINEERS.—Meeting at 7.30 p.m.

BIRMINGHAM AND DISTRICT CLERK OF WORKS' AND BUILDERS' FOREMEN'S ASSOCIATION.—Mr. W. H. Whitehouse, A.M.I.O.E., on "The Great Pyramid," 8 p.m.

Tuesday, April 8.

SOCIETY OF ARTS (Applied Art Section).—Prof. Beresford Pite on "Street Architecture," 8 p.m.

Wednesday, April 9.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. E. Worth, M.I.O.E., on "Scavenging, Disposal of House Refuse," 7 p.m. Inspection and Demonstration in the District of Islington, and at the Borough Disinfecting Station at 2 p.m., conducted by Mr. James R. Leggett.

INSTITUTION OF CIVIL ENGINEERS.—Students Visit to the Works of Messrs. Doulton & Co., Ltd., High Street, Lambeth, S.E.

New Companies.

Essex Decorating Co., Ltd.

Registered to carry on in the United Kingdom or elsewhere the businesses of builders and decorators. Capital £500 in £1 shares. Registered office: Cameron Road, Seven Kings, Ilford, Essex.

Natal Coalfields, Ltd.

Registered to carry on business as coalmasters colliery owners, dealers in and with coal, clay and mineral products of all kinds; as brick tile, and pipe makers, &c. Capital £30,000 in £1 shares.

Severn Valley Coal Syndicate, Ltd.

Registered to acquire any mines, &c., in the county of Shropshire, and to carry on the general businesses of coal and iron masters, brick and tile makers, &c. Capital £10,000 in £1 shares. The directors are G. Bridges and J. Barnes. Registered office: 794, Salisbury House, London Wall.

Crittall & Winterton, Ltd.

Registered to adopt an agreement with F. H. Crittall and W. S. Winterton for the acquisition of the business carried on at Bank Street and High Street, Braintree, by Crittall & Winterton, and to carry on the general business of iron-mongers, heating and sanitary engineers, tool makers, brassfounders, copper and white smiths, metal workers, &c. Capital £13,000 in £5 shares, 150 of which are founders' shares. The directors are S. C. Parmenter, F. H. Crittall and W. S. Winterton.

Grangetown Land and Building Co., Ltd.

Registered to acquire certain freehold land, containing 17,864 sq. yds. or thereabouts, at Grangetown, Yorkshire; to erect and maintain any houses, shops, factories, warehouses and other buildings; as builders, contractors, decorators, merchants, dealers in stone, sand, lime, bricks, timber and other building requisites, and as brick, tile, pipe and terra-cotta makers. Capital £25,000 in £5 shares. The directors are J. A. Macfarlane (chairman), W. Bastiman, D. Mackay and J. M. Bottomley.

Small Dwellings Acquisition Co., Ltd.

Registered to erect dwellings suitable for the occupation of artisans, labourers, clerks and others; to erect shops and other buildings; to lay out land for building purposes; to enter into any contracts with builders, tenants and others; to negotiate loans. Capital £100,000 in £1 shares. The directors are T. Wrightson, Bart. (chairman); Hon. C. G. Hay, M.P.; Sir A. Hickman, M.P.; H. R. Graham, M.P.; Captain H. M. Jessel, M.P.; E. R. P. Moon, M.P.; H. P. Pease, M.P.; W. B. Peat; Hon. W. R. Wellesley Peel, M.P., and Sir W. B. Richmond, K.C.B., R.A.

Rawson, Hubbard & Co., Ltd.

Registered to adopt an agreement with Arthur Rawson and J. C. Hubbard for the acquisition of the business, undertaking, assets and liabilities of Rawson, Hubbard & Co., as now and hitherto carried on at Tudor Works, Manor Road, Stoke Newington, and generally to carry on business as wood-carvers, woodworkers, moulding manufacturers, timber merchants and growers, sawmill proprietors; also as builders and decorators, plumbers, carpenters, furniture and cabinet manufacturers, upholsterers, &c. Capital £3,000 in £1 shares. Governing directors, A. Rawson and J. C. Hubbard. Registered office: 14, Manor Road, Stoke Newington.

Osmaston Estate, Ltd.

Registered to acquire certain lands in the parish of Osmaston, in the extended county borough of Derby known as the Osmaston Estate; to acquire lands and buildings of any tenure; to develop the Osmaston Estate; as builders and contractors, builders' merchants, dealers in stone, sand, lime, bricks, timber, hardware, brick, tile and terra-cotta manufacturers, decorators, plumbers and glaziers, house agents,

&c. Capital £100,000 in £1 shares. The directors are W. Bemrose, Sir H. H. Bemrose, Henry Litherland, H. T. Alton, W. W. Bemrose, T. Fletcher, C. R. B. Eddowes and A. C. Bemrose. Registered office: Babington Buildings, Derby.

Bourne End Abbey.—In view of the excavations recently made under the auspices of the Royal Archaeological Institute on the site of the Bourne End Abbey, Buckinghamshire, Mr. Vaughan Williams, the owner of the property, announces that he is willing to allow visitors to inspect the site of the ruins and objects of interest that have been discovered. Each visitor will be charged 1s., and the amount realised will be devoted to the restoration of Little Marlow Church.

OUR

INSURANCE SCHEMES

offer advantages of which every Reader should avail himself.

These are the Schemes:—

- (1) **A Free Accident Insurance of £500 to every regular reader of our paper.**
- (2) **An Accident Insurance of £500, and also £250 for Permanent Total Disablement. £2 10s. per week for Temporary Total Disablement.**

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

- (3) **An Accident Insurance of £1,000, with the following special additional advantages: £500 for Permanent Total Disablement. £6 per week for Temporary Total Disablement. £1 10s. per week for Temporary Partial Disablement. £30 Annuity. £3 per week during confinement from such illnesses as Small-Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c.**

Ordinary Risks, Premium, £3/-

Hazardous Risks, Premium, £3/10/-

Write for Proposal Form.

These Insurances are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

SPECIAL NOTICE.

- (1) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.
- (2) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.
- (3) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.
- (4) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.
- (5) In applying it is only necessary to write a postcard, giving the full name and address of the newsagent from whom the copy is obtained.

A Pamphlet, giving full details of the **THREE SCHEMES** will be sent on application to

THE MANAGER, BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,

An Architectural Causerie.Architects
and Money.

ARCHITECTURE and money-
making are clearly opposite,
and if a man's aim is toward

the latter he will not achieve it as an architect. But we are glad to think that the art of building does not set up such a sordid ideal. There is, however, a vast difference of meaning as regards money-making; there is the idea of the miser, who, among moderns, may just as appropriately be found among the "bonnes hommes" as among the more traditional regions of garret and cellar; but, be it said, money-making also includes the idea of acquiring sufficient wealth to live in comfort, among which class are counted the majority of well-known architects. The late Mr. Arthur Cates, though known as a zealous reformer of architectural education rather than as an architect, was by far the richest of his colleagues—he died worth £174,000; though of course this was not acquired in practice. Another F.R.I.B.A. who died a short time ago was also comparatively wealthy, his estate having been

proved at £40,000; but these are most marked exceptions, for one might say, speaking of successful modern English architects generally, that their possessions average about £3,000; while the average successful shop-keeper is probably five times as wealthy. Neither J. M. Brydon nor William Young were rich men; the estate of the late James Brooks was worth £4,000; and the late Mr. Bentley's has just been proved at £4,000: so that it is better to be a pork-butcher, or a man of commerce, or a professional swindler, if one wishes to die rich. Sir Christopher Wren was paid £200 a year when St. Paul's was being built, and the sum of £4 for being hoisted in a basket to the top of the dome four times a week: and things have not changed. There is still the same cry of the neglect of the architect today as there was in 1820, when "The New Builder's Magazine and Complete Library" was published, a book intended for architects, surveyors, carpenters, masons, bricklayers, &c., "as well as for every gentleman who would wish to be a competent judge of the elegant and necessary art of building," the whole forming a "complete system of architecture in all its branches, and so disposed as to render the surveyor, carpenter, bricklayer, mason, &c., equally capable to erect a cathedral, a mansion, a temple, or a rural cot." The price of materials has increased and wages have gone up, but the architect's commission still remains at 5 per cent. Of a truth genius gets little else than its own reward. The men who make the most money are generally those who have a little architectural ability and a great deal of commercial astuteness, so that the buildings they erect, though they may be as full of defects as a pod is full of peas, yet are very profitable; for it is these men who usually secure the large commercial works. But what an inheritance they leave behind them, what a collection of eyesores, what a testimony to their littleness and their mediocrity!

**A Curious
Proposal.**

MR. HENRY H. B. SANG again brings forward the suggestion which he made at the time of the Jubilee for illuminating the exterior of St. Paul's Cathedral as a feature of the festivities. His idea was adopted at that time by the City authorities, but only thirty searchlights were employed, whereas he states that at least fifty or eighty should be arranged on the surrounding buildings, because the lead-covered dome absorbs the light considerably, and consequently needs to be strongly illuminated. The effect of buildings brilliantly lighted at night is most pleasing

—Pall Mall, for example, is exceedingly effective when all the outside gas jets of the numerous clubs are alight, while the Glasgow Exhibition was eminently successful in this particular—and doubtless the lighting up of St. Paul's in the manner suggested would be equally imposing and satisfactory. The scheme is not a costly one, nor difficult to carry out, and we trust that the authorities will again adopt it, this time, however, employing a sufficient number of lights. Devices made up of hundreds of gas jets are expensive to maintain and very often they are not effective, especially if there is a high wind at the time; searchlights, on the contrary, are independent of the wind, and offer a new and unique scope for illumination. The dome of St. Paul's Cathedral can be seen in the daytime from considerable distances, even through the smoky atmosphere; it is grand from every point of view: and maybe it would gain in grandeur when seen at night as a beautiful object ablaze with light in the midst of a sea of black houses.

**The Widened
Strand.**

THE widening of the Strand in connection with the new street to Holborn is the most thorough and satisfactory improvement of its kind which has been carried out in London for many years past. We suffer in this country from narrow streets. Dinan is not inconvenienced by its picturesqueness, but a city like London is: an ultra-modern might even consider Fleet Street picturesque, and if narrowness be the first requirement of such beauty Fleet Street certainly possesses it in a paramount degree. But, to make use of Bacon's aphorism, streets are made to live in, not to look at: and a modern city requires wide streets. Paris was laid out as a spectacle it is true, but how admirably convenient are its streets. The great mind was at work there and it is a pity that the example is not more often followed. In every town throughout the country will be found narrow main thoroughfares which might have been wide ones if the authorities had only taken time by the forelock. Patching is futile. Fleet Street is being widened piecemeal, with little improvement. But in the Strand we at last have the grand idea—a wholesale clearance and a resulting fine vista east and west. At the present moment the roadway west of St. Clement Danes Church is a mass of wood blocks, tar, pitch, sand and other materials, with scores of men at work on them; but very soon the whole will be finished and then London will be proud of a thoroughfare of generous width.

HOUSE AT HELENSBURGH. M. H. BAILLIE SCOTT, ARCHITECT.

TOWER SCREEN, SEAL CHURCH, KENT. C. R. ASHBEE, ARCHITECT.

THE SCOTCH UNIVERSITIES AND ARCHITECTURE.

A MEETING of the Edinburgh Architectural Association was held last Wednesday, Mr. Henry F. Kerr, A.R.I.B.A., the president, occupying the chair. Mr. James Bruce, W.S., submitted the following motion: "That it be remitted to the Committee of Management to consider the provision made in the Scottish Universities for the teaching of architecture, and in the event of the Committee being satisfied that the same is inadequate, to report whether in the opinion of the Committee an application should be made to the trustees of the Carnegie Trust with a view to more adequate provision being made for such teaching." Mr. Bruce remarked that in the University of Edinburgh there were fifty-two professorships, but among them all there was not one devoted to architecture. In the Faculty of Law there were no fewer than seven professorships. When they thought of the enormous importance of architecture to the health, happiness and comfort of the people, it was really a very extraordinary thing that in the University of Edinburgh there was no such thing as a professorship of architecture. More than that, so far as he knew, in no Scottish University was there any provision made for a professorship of architecture. The Carnegie Trust had just been considering the wants of the Scottish universities. The universities had been asked to indicate where their wants lay, and although he had gone over the statements published on behalf of the university authorities, in not one of them was there even a hint that there was any lack in the matter of the teaching of architecture. Surely that was a strange position for the universities of Scotland to occupy. Accordingly he thought it would be well for a body such as the Edinburgh Architectural Association to directly press upon the Carnegie Trustees the advisability of something further being done in the matter of the teaching of architecture in the universities. He used the phrase "something further," because to some slight extent the matter was attended to in the University of Edinburgh through the Chair so well occupied by Professor Baldwin Brown, namely, the Chair of Fine Art.—Mr. G. S. Aitken seconded.—The chairman, in supporting the motion, suggested that the matter, instead of being remitted to the Committee of Management only, should be remitted

also to the Council. He read a letter from Professor Baldwin Brown, who expressed cordial agreement with Mr. Bruce's motion. Even though the Carnegie Trustees had too many claims before them to permit them to do anything in the matter immediately, it would be a good thing to put the demand for a Chair of Architecture, or some agency of the kind, distinctly before the public. The chairman added that he had seen a good deal of what was done in the teaching of architecture both in France and America, and he was perfectly confounded with the extraordinary development of the teaching of architecture in these countries. In some cases they had twenty-six or twenty-seven teachers of one kind or another in that subject alone. Why should it not bulk more largely in Scotland? The sooner they tackled the subject the better. The motion was unanimously

adopted.—Mr. Wilson Beatson afterwards read a paper, written by Mr. James Miller, I.A., on the Glasgow International Exhibition of 1901.

THE DECORATORS OF THE BOSTON LIBRARY.

PUVIS DE CHAVANNES; SARGENT; ABBEY.

IT will be recollected that a short-time ago the last of Mr. Edwin A. Abbey's paintings for the Delivery Room of the Boston Library (U.S.A.) were exhibited at the Guildhall, London. These paintings have now been placed in position, and it is therefore opportune to give a description of the decorations of which they form a part, which description we take from our esteemed contemporary, "The Architectural Review" of Boston, U.S.A.

Entering the library, the Puviss de Chavannes decorations are the first that are encountered. The entire scheme of colour in the entrance-hall, staircase and second-storey corridor is one of yellow Siena marble, rich in tone. It is conceivable that this might receive a foil in the decoration by the introduction of contrasting blues, but these should be distributed and subdivided merely as elements of contrast. The introduction of cool grey blues in low tones and large masses only tends to destroy what unity there may be in the architectural design. The wall is at once disassociated from the dado, pilasters and ceiling, and in this respect fails to be successful in the best sense of decoration. There recurs a constant desire for the tones and colouring of the Venetians which would have harmonised with the marbles. On the other hand the low-tone values, the absence of shadow, and the simplicity of composition in the Puviss de Chavannes paintings are all strongly decorative factors and are handled in a masterly manner. Whatever further criticism can be made is that there is a general insufficiency of motive or idea in most of the work. Each theme is made to cover an absurdly large area for its relative importance, and this is especially true of the wall-surfaces at the head of the staircase. There is too much of the character of a procession around a Wedgewood vase. Each figure framed within a panel might and would be decorative, but the relation of each with the next is extremely slight. This is to be regretted, as the canvases of M. de Chavannes at Amiens or at the Sorbonne in Paris have a masterly rhythm between the groups and are in each case complete compositions for the entire wall space, not isolated figures upon a sea of background.

The Sargent decorations in the long gallery upon the floor above are the very antithesis of these. Redundant in idea, showing much

HALLINGBURY PLACE, BISHOP'S STORTFORD, ESSEX: BILLIARD ROOM.
C. R. ASHBEE, ARCHITECT.

research, painted with mastery of technique, they give an impression of skill, of thought, and of ability to express that is in some respects overwhelming. The frieze of the Prophets is a masterpiece in its way; dignified, simple and with great individuality, and with thoroughly decorative ensemble; but the barrel vault and tympanum are too full, both in ideas and in motives. They are not easily decipherable, but require elaborate explanation. Forms interlock and overlap, colours and tones weave in and out until it is difficult to disentangle one motive from another. Undoubtedly this is intentional and symbolic of the confusion of religions which the decoration expresses, but it is a question whether this idea is not carried too far, and whether less elaboration and more directness of declaration would not be better decoration. The treatment at the other end of the hall is, it is said, to be much more simple.

Passing to Mr. Abbey's frieze in the Delivery Room there is found a third and equally individual conception of decorative painting. There has been much criticism in regard to this frieze in that it resembled merely illustrative work and lacked in what the painters have termed "breadth of conception." Yet it is difficult to imagine any treatment of comparatively unrelated incidents from a legend being anything else than illustrative. Whatever common impulse or motive existed that could be carried through the series has been carefully studied, but necessarily each panel is complete in itself, and the sequence of the scenes is established by the course of the narrative. This determines a consecutive number of scene-motives which are with difficulty made either symmetrical or simple in effect, however direct they may be in expression. The balance of either colour or tone values upon either side of the central axis of the room has therefore been abandoned, and in that respect leaves something to be desired; especially is this true on either side of the window; the motive on the left being naturalistic, dark in tone, with strong horizontal direction; that on the right, conventional, light in tone, and with perpendicular treatment slightly counteracted by the profusion of gold. But the chief criticism, so far as decorative effect is concerned, is this, that there is no marked dominant colour scheme or tone value throughout the series. The result is that while photographs of the frieze are full of interest, carefully considered composition, delicate sentiment and feeling, the canvases themselves are disturbed by the constant shifting of colours and tones. This is partially due to the extremely poor lighting of the room, but not wholly so. There is no doubt that this work will gain with the influence of time, while that of Puvion de Chavannes will become an uninteresting monotone.

Here then are to be seen three important decorations. One kept in harmony of tone and colour, and with a marked paucity of idea and motive; another with overwhelming diversity and confusion of motive and idea, a general tone value, and one strong theme dominant in the frieze; the third full of ideas and motives which are consecutive in their action, but without dominant tone or colour values. All three have studied composition. The first of a naïve but none the less subtle type; the second masterly in every sense, but burdened with motive; the third of a less monumental or dignified character than either of the others, but none the less gracious and attractive. Such diversity of treatment naturally induces strong personal prejudices, but it can fairly be said that no more interesting groups of decorative work have been done in the country, and that each possesses individual virtues that entirely justify the choice of the artists. That each fails to be entirely satisfactory and to reach the decorative height of the best work of the Umbrians and the Venetians is the natural outcome of the multiplicity of ideas in regard to technique, composition and a hundred other things of our day. The organized restraining influence of an established and recognized method such as the Italians possessed, which in weak men produces mannerism, in strong men eliminates minor faults. The seriousness and study with which these library decorations are painted is stimulating compared with the flippancy of much of the work which is displayed for the admiration of the public. This fact alone places them beyond much carping criticism.

Views & Reviews.

Treatment of Sewage.

This is a very useful little work by Mr. Shenton. It is a collection of notes made by a practical engineer in the course of his experience in sewerage work, and the information is given briefly and directly, and though the book is intended for the use of engineers and contractors directly engaged in sanitary work it nevertheless is written in a manner which will enable anyone to gain an insight into the methods of sewage-disposal. As a book of memoranda for quick consultation and as a reminder, it should find its way to the engineer's library, but it would have been much improved if it had been got up in a more attractive manner and been given a better cover.

"The Modern Treatment of Sewage," by H. C. H. Shenton, M.S.E., price 2s. 6d. London: S. Edgecumbe-Rogers, Offices of the Local Government Journal, 2, Dorset Street, Fleet Street, E.C.

Applied Perspective.

The author states that in writing this book he has had in mind both the everyday use and the skilled use of the art. He has therefore given in Part I. what seemed necessary to qualify the student for ordinary perspective work, and in Part II. has included a series of special problems to show what trained draughtsmen actually do, adding discussions of some more theoretical topics to smooth the way to the complicated problems that sometimes occur. A fair acquaintance with ordinary school geometry is taken for granted, but the author hopes that an intelligent and careful reader who does not know geometry may find profit in the book and learn what is fundamental in it without unreasonable effort, and instead of commencing with geometrical definitions and a few bare framework lines he shows us some reproductions of natural photographs to explain the principles. He then passes on to projection and the finding of distances and vanishing points, showing how half-distance-points are obtained when the regular distance-point is practically inaccessible through coming too far on one side. *En passant* the author points out the misuse of the word "perpendicular," which strictly means at right angles and not necessarily upright or vertical. In this connection we may remark a somewhat similar confusion of the terms "level" and "horizontal," a level line being a bent line whose component points are everywhere equidistant from the centre of the earth, and a horizontal line being a straight line whose ends are up on the same level. A somewhat unusual but very important chapter follows, on perspective scales, leading up to the perspective plan and the measurement of lines lying in any given direction, and we are then shown how to find the conjugate vanishing points and their application to ordinary cases and to inclined planes. The perspective of circles is explained in a very practical manner and illustrated by a photograph of the Chateau Chaumont. Having dealt with the principles of perspective, the author next goes on to the construction of pictures, pointing out that the effects of perspective are due to foreshortening by oblique projection on the picture plane, and that variations in this for shortening are main sources of the interest we take in the aspects of the things which we depict; some of these foreshortenings are agreeable and some are not, and though it is not possible to classify them fully we can note some of their favourable and unfavourable conditions and utilize them where suitable to our work. Those who have carefully read and studied the book so far will not be deterred by the greater complexity of Part II., especially as the opening chapter is headed "Perspective Helps," thus clearly indicating its object and scope. Some of the intervening chapters may however be passed over at the first reading in order to see what the author has to say upon perspective from elevations, which he works out in the case of a broach spire, pedestal, console and pediment. He also explains the mode of dealing with groined vaulting, finishing up with a vault with lunettes. In reading this book one is attracted by the excellence of the illustrations and by the idea all through that if the writer is not an architect he is thoroughly in sympathy with architectural aims and desires, and that what he has to say

will be more useful to the professional man than a more precise description written by a geometrician.

HENRY ADAMS.

"Applied Perspective for Architects and Painters," by William P. P. Longfellow. Boston and New York, Houghton, Mifflin & Co. The Riverside Press, Cambridge, 1901. London: Gay & Bird, 22, Bedford Street, Strand: 4to., 97 pp., price 13s. 6d.

A CRITICISM OF MODERN CITY BUILDINGS.

IN the course of a paper on London buildings which he read recently before the London Institution, Mr. C. H. Reilly, M.A., asserted there was not in England at the present moment any single serious attempt at architectural criticism. A man was allowed to defile our noblest streets with some blatant exposure of his own vulgarity or that of his architect without a word of protest being raised. Why, he asked, should it be thought necessary now for a merchant to place everything behind sheets of shining plate-glass, extending sometimes over two storeys, and cover the remainder with gilt lettering many feet in height, without any regard to the scale of the building, much less its architectural detail?

In the course of the lecture Mr. Reilly illustrated and described many of the old City buildings, and when speaking of St. Paul's described Sir William Richmond's decorations, which he contended were out of character and out of scale with the building. He afterwards passed on to a general criticism of the methods employed in the erection of modern buildings, more particularly as regards the City. First of all, he said, the sites usually belonged to different owners, and were let to various speculators, who built according to their lights; consequently in all our streets there was a maximum of irregularity and haphazard effect, as compared with a typical Paris street. He then called attention to the great blocks that are being erected in Finsbury Circus, where the two adjacent quadrants of a circle were in the hands of two separate firms of architects, with the result that the buildings were totally different. Having pointed out that the City authorities are the ground landlords of each block, he declared that one dignified scheme for the whole might very easily have been obtained. He condemned the long front of the new Salisbury House to London Wall, which for flatness and monotony could hardly, in his opinion, be equalled. The Treasury building, on the other hand, was a good example of dignified simplicity, which nowadays seemed incompatible with commercial success.

Roughly speaking, the average City building came into existence in this way: A surveyor—that is a person who knows, or professes to know, all about the value of property—sees advertised what he thinks is an eligible site. He gets the particulars together and takes them to a client of his who speculates in City buildings, and shows him what may be done with the site. The speculator agrees, and appoints the surveyor his architect, not because he necessarily knows anything about architecture as an art, but because he knows the value of ground rents. That was why all these curious buildings were put up.

Recent Work by Mr. Ashbee.—The screen for the bell ringers in the tower of Seal Church, Kent, was designed by Mr. C. R. Ashbee, M.A., and is in oak with wrought ironwork and Powell's green antique glass panels: it was executed at the Guild of Handicraft, Essex House, Bow, E. The panels in the cove are carved in relief and are coloured and gilt.—The billiard-room to Hallingbury Place, Bishop's Stortford, Essex, is on the south front of the house and is built of red bricks, with a flat lead roof. All the external timber is of oak and the ceiling of the room is constructed of large English oak beams framed together, with heraldic plaster panels, coloured and gilt: on the beams themselves are painted scrolls bearing the names of the branches of the family represented by the shields. The lower parts of the walls are panelled with sixteenth-century woodwork, and the fireplace and overmantel are also fine examples of similar date. The skylight, bay window and the wrought-iron grilles at each side were executed by the Guild of Handicraft, London, E.

ARCHITECTURE AT THE INSTITUTE OF FINE ARTS, GLASGOW.

ILLUSTRATED BY J. JEFFREY WADDELL.

THIS year the architectural works at the Institute of Fine Arts, Glasgow, are shown in the entrance gallery, which they share with some sculpture and the "black and whites." Owing to lack of wall space, some of the best drawings have been hopelessly "skied," but, considering the limitations imposed upon him, the hanger, Mr. James Miller, the well-known architect, has utilized the space at his disposal very well.

One of the best drawings in the gallery is the perspective of the proposed new Royal Infirmary by Mr. H. E. Clifford, which, it will be remembered, was the design placed first by Dr. Rowand Anderson. Both design and drawing are excellent. The same architect is also represented by a drawing of Newlands U.F. Church. An excellent drawing is also shown by Messrs. Niven & Wigglesworth, of London, of a rough-cast house at Bromley, Kent. A very fine series of photographs is shown by Mr. R. S. Lorimer, of Edinburgh. His church details—photographs of the Church of the Good Shepherd, Murrayfield—show a scholarly yet free treatment of medieval Gothic, while his house and gate lodge at Brylands, Fossoway, in the Scottish Renaissance style, are in his happiest manner. Two views are shown of Tollcross Church by Mr. W. G. Rowan; the exterior of this characteristic and quaint village church is given among the accompanying sketches. Mr. Macgregor Chalmers is represented by two views of Stepps Church (already illustrated in these columns), and Messrs. Watson & Salmon and Miller & Black are also represented by ecclesiastical work. But among the photographs shown undoubtedly the first in merit as well as in size is the splendid enlargement shown by Mr. James Miller of the Piazza and Dome of the late Glasgow Exhibition. This photograph has all the effect of a sepia drawing with the additional correctness which belongs to the camera. One is also reminded of the Exhibition by Mr. George S. Hill's views of Templeton's exhibit, a Moorish mosque-like building. A large frame of interior photographs of No. 4, University Gardens, is exhibited by Mr. John James Burnet. This work has been carried out in the architect's characteristic broad manner and well repays careful study. Mr. John A. Campbell shows two interior photographs, one of which, the Cottage Home at Drymen, is very pleasing. A block of business premises, West Nile Street, is shown by Messrs. Burnet, Boston & Carruthers, but it is not very successful. Mr. Alexander Cullen, of Hamilton, shows a very good classic design for the Middle Ward Offices at Hamilton; Mr. James A. Morris, of Ayr, exhibits three elevations of country houses in his usual somewhat

original style, drawn in brown ink and rather loudly coloured. Messrs. T. L. Watson & Mitchell's competitive elevation for the Technical College is a very good piece of design, and compares very favourably with the elevations of the accepted design, which we understand gained its place solely on the merits of its plan. This firm is also represented by a good perspective of a moderately successful frontage in Bath Street, and Mr. Mitchell by a cleverly-coloured conventional drawing of Salzburg.

While some of the work shown is very good, much is below the average of previous exhibitions, and it is to be regretted that as the authorities made up their minds to restrict the space this year they have not had the courage to return several of the exhibits. The walls have the effect of being overcrowded, and not always with works worthy of the position, the consequence being that the exhibition is not so representative of the best current architecture of Glasgow as it might have been.

Law Cases.

Galleries in Schoolrooms.—At the Lambeth Police Court recently a builder named Henry Young was summoned for not complying with notices of irregularity served upon him by Mr. Ellis Marsland, district surveyor for Camberwell, in connection with certain works carried out by him at the Congregational Church and Schools, East Dulwich Grove. Mr. Marsland explained that the defendant was summoned for a breach of section 80, sub-section D, of the London Building Act, which provides that "in all cases where a portion of the public is to be accommodated over or at a higher level than others of the public, a separate means of exit . . . communicating directly with the street or open space shall be provided from such floor or level." The point for the consideration of the Court was whether a new gallery which had been erected in the schoolroom was used by the public, and as such required a separate staircase as provided by the section. Mr. Marsland proceeded to say that he allowed the staircase which had been provided on the understanding conveyed to him by Mr. Cubitt, the architect, that the gallery was not intended for the use of the public. On visiting the schoolroom on December 17th he found that the services were being held there temporarily, pending the alterations to the church, and that the gallery was being used by the public. This had been discontinued, but the gallery was being used by the teachers and scholars of the Sunday school. He served a notice upon the defendant to provide a separate staircase from the gallery into the street or other open space, but that had not been complied with.—Mr. Corrie Grant (for the defendant) said the gallery was intended for use on Sunday mornings and afternoons by some of the classes of the Sunday school. Were Sunday school children the public? He submitted they were not the public in the sense in which the word was generally used.—The magistrate thought that so long as the gallery was only used for school purposes during school hours, he did not think that in the circumstances Mr. Marsland could object: he did not consider the children in the school were a portion of the public. He therefore dismissed the summons, but made an order with respect to certain gangways in the church which were not sufficiently wide to comply with the Act.

Ancient Lights.—The case of *Easton v. Isted* was recently heard in the Chancery Division of the High Court of Justice. The plaintiff was the owner and occupier of the "Golden Fleece Hotel," Commercial Road, Portsmouth, and the defendant was the owner and occupier of the adjacent premises. The action was brought in respect of the obstruction by the defendant of the access of light over a yard at the back of his premises to a window or skylight over a passage or corridor in the plaintiff's hotel. The window or skylight in question was inclined at an angle of somewhat less than 45 degs. to the plane of the horizon, and somewhat more than 45 degs. to the vertical plane. The plaintiff's complaint was in respect of a wall recently erected by the de-

TOWER OF TOWN HALL.
J. A. T. HOUSTON, ARCHITECT.

fendant along or close to the boundary line, and obstructing the access of light over the defendant's property to the window or skylight. The defendant did not admit the plaintiff's claim that the skylight in question was an ancient light. It appeared that the window or skylight in question originally formed the sloping top of a conservatory erected by the plaintiff's father in 1873 on the northern side of the hotel and abutting upon the defendant's property. This top was entirely glazed, as also was the whole of the vertical side adjoining the defendant's property above a few feet from the ground. Portions of the glazed side, amounting to less than one-half, were movable, being hung upon hinges at the top and opening outwards from the bottom, so as, when open, to overhang the defendant's property. It further appeared that at the time of the construction of the conservatory in 1873 an agreement was entered into by which the then owner of the plaintiff's property agreed to pay 1s. per year as an acknowledgment for allowing the window in his conservatory to open on to and overlook his neighbour's property, and also agreeing to close it when required to do so. The yearly payments were duly made under this agreement down to 1888, when the glass side of the conservatory was bricked up, leaving the glazed sloping top in its original position and forming the roof of what was now a corridor in the hotel. The defendant had recently erected buildings at the

FONT, CHURCH OF THE GOOD SHEPHERD,
MURRAYFIELD. R. S. LORIMER, ARCHITECT.

rear of his premises in such a position, and carried the same to such a height as to obstruct the access of light to the glazed roof of the corridor, and the plaintiff brought this action, claiming an injunction and damages. Mr. Justice Joyce, in giving judgment, said it could not be contended that the agreement was limited to the movable sashes in the northern and vertical side of the conservatory. It certainly extended and applied to the whole of the glazed portion of that side. But it was obvious that the object of the arrangement was to preclude the acquisition by the owners of the plaintiff's property of a statutory right to light over that of the defendant. It was suggested, however, that although while the arrangement continued and the annual payment of 1s. was duly made—as it was until 1888—no right was being acquired in respect of the glazed portion of the side, still such right was, during that time, being acquired in respect of the glazed portion of the sloping top, notwithstanding the existence of the arrangement and the continuance of the payment. In his Lordship's opinion it was almost impossible that this should have been intended by the parties to the arrangement, and he thought that the agreement would very well bear the construction that would effectuate what must, he thought, have been their intention. The sloping top received rays of light across, and in that sense overlooked, the defendant's property in the same manner as, though to a less degree than, the fixed portions of the side; and it was in respect of the obstruction by the defendant of those very rays of light that the action was brought. If the written agreement applied as it did to the fixed and glazed portions of the side, it equally, in his Lordship's opinion, applied to the glazed portion of the sloping top. A window was not the less a window because it was not capable of being opened, nor because it was not fixed in a vertical plane. His Lordship thought the glazed top was just as much a window as the fixed portion of the vertical side, and, inasmuch as it received light over the defendant's property, it overlooked that property in the sense in which that term was used in the agreement. The plaintiff's action therefore failed, and must be dismissed with costs.

Laying-out "New Streets": Important Case.—The case of the *Mayor of Devonport v. Tozer & Sons* was recently heard in the Chancery Division of the High Court of Justice. This was an action for an injunction to restrain the defendants from laying-out certain highways in Devonport as new streets without complying with the requirements of the by-laws of the plaintiff corporation. The case raised questions of considerable importance to local authorities. The first was whether the owners of land abutting on a highway, who had built houses on such land, fronting the roadway, could be said to be laying-out or constructing a new street, so as to bring themselves within the provisions of the local by-laws. The second question was, assuming that in such a case an offence had been committed against the by-laws, was an action for an injunction the proper remedy? In the course of his judgment Mr. Justice Joyce said that what the defendants had done and were doing was to erect certain houses upon their own land without removing the fence on either side, but making the necessary openings here and there so as to provide means of entrance to and exit from the houses that were being built. They had done nothing more than this. The land in question was triangular, one side abutting on a public highway called Ham Lane, and another on a similar highway called Tavistock Road. Now, said Mr. Justice Joyce, were the defendants laying out or constructing Ham Lane and Tavistock Road as new streets within the meaning of the by-laws? "It is clear that in the ordinary, popular and natural sense of the words they had not done so, nor ever intended to do so. In fact, it was the one thing of all others which they intended not to do. The word 'street' has various significations in different Acts of Parliament, but *prima facie* with respect to the laying-out and construction of new streets, it is limited to what is used or intended to be used as roadway; and my reasons for this view are those stated by Selborne, L.C., in *Robinson v. Barton Local Board* (L.R., 8 A.C., 798). I am unable to see how what the defendants have done or are doing is laying-out or constructing a new street or any-

thing of the kind within the meaning of the by-laws, unless there be some judicial decision which compels me so to hold. I do not think there is any such decision. In my opinion this action is misconceived and must be dismissed with costs."

No. 136, PRINCES STREET, EDINBURGH.

NO. 136, Princes Street, Edinburgh, is a new building which has just been completed for Messrs. Macvitties, Guest & Co., Ltd., bakers and confectioners. It has been in process of construction for the last two years, and has attracted a good deal of attention on account of the façade having certain novel features which are not to be seen elsewhere along the whole line of the street. Messrs. Hamilton, Paterson & Rhind were the architects. With a frontage of 30ft. to Princes Street, the building, 80ft. in height, is divided into four principal

octagonal pilasters, which rising above the whole of the floors are finished atop with carved pinnacles. Two coloured shields of Royal patrons of the establishment affixed on each side bind the granite and ashlar masonry together; and the ornamentation being all bold and the windows considerably recessed a fine play of light and shade takes place over the building under the influence of the afternoon sun. The building is L-shaped, the other front being to South Charlotte Street, where the elevation is substantially the same as that of Princes Street, though the frontage is 5ft. less in width. In the angle of the L there is a large dome with lantern, the opening to which is 25ft. from the floor. The lower panels of the dome, which is 28ft. across, are decorated with the signs of the Zodiac, the figures being in low relief. The whole of the decorations of the shop are in stencilled ornament, gold and light colours being freely used with pleasing effect. The tea-room above, 50ft. by 25ft. by 14ft. in height, is an elegant hall panelled in fine Scottish plaster-

CHURCH
TOLLCROSS

W. G. ROWAN, ARCHITECT.

floors. The walls are of sandstone ashlar, except the whole of the shop front, which has been faced with polished red Corranie granite. The feature here is a segmented arch which encloses a central doorway and two large windows, one on each side. The door is deeply recessed and its oak woodwork is carved in a light French style. There are four French casements on the first floor set in a massive arcading, each opening separated from its neighbour by a three-quarter column with an Ionic capital. The four windows on the second floor are of a plainer character, being divided by simple angle pilasters, breaking into the square at the base, with carved stops. Higher is a plain frieze, over which are the grill-room windows on the third floor. The divisions between them are pronouncedly treated with rusticated blocks, which give a feeling of strength to them as supports to the main cornice. This latter is of a plain character with modillion blocks. Above this rises an ornamental gable top having a circular window supporting a carved niche with side pillars, and overhead a broken pediment. The building is, so to speak, framed on its east and west sides by

work, with a large ceiling painting by a French artist. The smoking-room is panelled in dark oak, and has for special feature an old English fireplace with ingle-nook, the opening of the hood of which is 14ft. across by 7ft. in height. The grill-room above is fitted up to resemble an old English kitchen. It, too, is panelled in dark oak. The ceiling shows exposed joists with white plasterwork between, and the windows are filled with leaded glass of novel designs. The kitchen is on the top floor.

St. Erth Church.—The fifteenth century carved oak cradle roof in the south aisle of St. Erth Church, one of the most interesting of West Cornwall churches, has been enriched by the addition of about one hundred carved oak bosses, each different, from designs by Mr. E. Sedding. The eastern end has been converted into a morning chapel, the roof being embellished with carved panelling. All is in West-country grown oak, and the work has been carried out in its entirety by Messrs. Harry Hems & Sons, of Exeter.

THE BERLIN OVERHEAD AND UNDERGROUND RAILWAY.

An Example of Architectural Engineering.

THIS line, which has just been opened for traffic, is to many Berliners a positive eyesore. It is a long line, partly overhead, partly underground—a kind of switchback; and those parts of it that appear above ground were designed from no other point of view but that of utility and cheapness. Of course no fault may on this account be found with the engineers, Messrs. Siemens & Halske, but it was surely the concern of the public authorities of Berlin to see that the new enterprise should not be a blot on the capital of the German Empire. The "Berliner Architekturwelt" furnishes an illustrated description of the railway from the architectural point of view and introduces its article with the remark that the contractors did what seemed to them the wisest thing to do—they simply let people say what they liked. The line had to be practical and cheap. Not a bolt was to be used (more than was necessary) on behalf of the beautiful—that would have been unscientific. But as the red painted frame of the structure kept annoying the Berliners a miracle occurred. The company provided a considerable sum of money to save what could be saved in respect to beautifying the structure, and as the finished work is now presented to the eye the grumblers are more and more pacified. The covered way which the overhead line furnishes along the streets begins to impress its value on the people, and the residents find that the noise is not so great as from a common tram-line. At this point the writer of the article waxes enthusiastic and says, "I go further and maintain that he who can feel the pulse of the age and follows with open eyes our architectural development must be convinced that here, in spite of many and grievous initial faults, we have a landmark, a striking, brilliant expression of the present day. Just as in its time the project of building the town tramway brought about new and epoch-making architectural developments, so the overhead railway exhibits further progress in constructional ironwork which will doubtless be studied by the whole civilised world and pondered over."

At the starting-point of the line at the Warschauer bridge this modern art comes into æsthetic conflict with another, contributing at once the most shrieking discord. The barest matter-of-fact structure of the station of the "overhead," a work of naked but at the same time stern modern logic, comes immediately next to the bridge which exhibits the richest and most effective view of Berlin as seen from the Spree. Here is an extreme archaic art which appears to have nothing in common with the present, except as a sign of the time in so far as nine-tenths of our architects give an exterior appearance of old times to things in common use, a kind of tailor's art, forced by the fashion; but still the revered art of the theatre, that has an undeniable charm, so rich, correct and full of meaning as to make the public enthusiastic for the work of the Middle Ages; and there, on the other hand, is a picture wanting in everything that might be called art, namely, the appearance of an organism in which the discordant parts have to be got into harmony. In this last respect, consider the impression produced by the iron girders and the sandstone pillars whose traces of architectural effort make the discord still more unbearable and gives the whole structure the appearance of being temporary. The contrast will remain for all time a kind of Pasquill on the judgment of the builders. Nevertheless, says our German contemporary the germ of the future lies in that ugly structure, a fact which becomes clearer as one becomes accustomed to ironwork and its peculiar properties; and it is just in this respect that the overhead has a mission to fulfil. Frankly, buildings must in the first place rise to the position of an organism before they can pretend to aspire to the region of art.

Thus the quite undecorated stations between, like simple boxes with their stairways, are on the whole satisfactory in effect. Only when we consider the details of the supports do we become conscious of something wrong. The perspective eye marks only how much prettier

another arrangement would have looked, and seeks to be freed of the impression of a confused piece of network. To this first claim of the eye the writer of the article replies in the happy words of Richard Lucae, that an engineer must not keep in view all the individual calculations of the public along with the principal object to be attained. But even in this respect great progress has been observable during the execution of the work. At the Schlesisches Thor Station the stiff pair of supports with cross-beams and headbands where the line crosses the street near the Luther church have been converted into a simple form with a curved capital, which effectively exhibits not only its object as a support but is suited to its material. The bolt-heads and joint plates are so arranged as to form a decoration, so that utility becomes artistic—which is the art of the builder.

How much the engineer can do when he is laying his plan at the beginning is seen in the viaduct in the Bülowstrasse. Here the feeling of stiffness is done away with and confusion is avoided, while clear rhythm and pleasing outline are secured. The writer does not pretend to say that it is a model erection, but he holds it up as a genuine and a vigorous reflection of modern life. And with how little, relatively, is this impression produced. The slanted legs of the high level constitute the most genuine "æsthetic moment." They show forth the courage, lightness and airiness of the construction.

One of the most unfortunate effects has been produced by the Bellealliance bridge. Here the fine view of the street through the bridge, with its groups of figures, the two Strack Thor buildings and the view of the Bellealliance column and the Friederstrasse, were to be seen. It was evident that the broad line of the overhead would cut this view in two, and this has been done, so that the two groups on the town side of the bridge appear to be beheaded. "This awful result must, in my opinion, be rectified." Even the attention of the most unobservant is drawn to this muddle. Berlin surely cannot be content to be the butt of the scoffer; for twenty years afterwards people will only see the absurdity, and will not remember that the overhead was introduced later than these works of art. The picture will be seen and taken just as it is. Let the two groups be removed now. But a solution consonant with art might have been found. Had the form of a suspension bridge been adopted whose pillars could have risen from the landing places of the bridge, then the groups would have lent additional beauty to these pillars, and the lines of the bridge would have enhanced the beauty of the whole place and probably led the eye very pleasantly to the superstructure of the railway station. It must be admitted that this would have incurred a very heavy additional expense, and, besides, the most has been done to relieve the line of much of its illogical repulsiveness: to wit the landings and the exteriors of the pillars, which are however too highly coloured to show the static part they play.

It is to be noted, all the same, that this effect may be achieved in an apparently hopeless situation with seemingly small resources. On the Cottbuser Gate portion of the line a few of the plainest looking pillars have subsequently been furnished with decorated iron heads in modern style. The frightful looking gallows near the Hales Gates at the beginning of Gitschinerstrasse has been saved by superimposed iron decorative work; in fact it has been transformed into a notable architectural "subject." The high bridge over the canal near the Trebnerstrasse, which at present presents a most unfavourable impression, will be similarly treated. All these combinations show that the "architectural" in iron goes well with the modern trend of ornamentation. Each element will find its place, for the ornamental will keep in bounds the excess of line work in the mass of metal.

Even in the greatest problems of modern architecture the combination of iron and stone has made a most satisfactory advance in the overhead railway. The original indifference to æsthetic effect has been noticed at the beginning in respect to the Warschauer bridge station. Beginning from there, there is a steady improvement. The next unfortunate effect is at the Schlesisches Thor station, where an original

beautiful and ornamental construction in the Griebach style is cut in two by the overhead line. Here a certain effective expedient is attained by the construction of the roofing over the railway staircase in the form of open iron ways. Similar principles are followed in the small ascent at the gasworks in the Prinzenstrasse, where, with relatively small facilities, a telling and attractive solution of the problem is effected.

At the Bellealliance bridge stopping-place there is a most successful effort to harmonise the iron and stone structure where two different kinds of architecture have been thrown carelessly together. The work begins under the permanent way, and working up the steps culminates freely in front of the iron-covered way. On the whole the metal is allowed to play the chief part, and it lends to the purely practical construction a stronger appearance. The difficulties presented by the position of the stairs have been so successfully overcome that they are scarcely suspected, and the whole is carried out so effectively in point of originality of construction and general conception in all details as to merit the highest admiration, even if a certain heaviness in the composition still makes itself felt.

A quite different artistic principle obtains in the stonework westwards. Elements difficult to combine are kept quite separate. The supports only are in stone, and all on the top is ironwork. No compromise is sought after. It is a question whether this principle is artistically correct, but at any rate its effect is surprising and convincing in so far that the stations are thus like simple enlargements of the overhead viaduct, which is correct. The prevailing idea in this arrangement lies in the special exterior pillars. The introduction of the central approach under the viaduct is uncommon; the viaduct is only broken in the Blumenthalstrasse, where it changes its course by means of a beautiful support in the form of a gate; but particularly the rising curve thrown outwards, which brings into communication the opposite beds bearing the longitudinal girders at different altitudes. The line lies safe as in a cradle. It works out very fortunately having the station buildings raised above the line by means of these supports, particularly in that the profile of the station can be visibly continued in the supports below, so that the constructive work of the viaduct appears to have been forced through the opening of the horseshoe formation beneath.

Of the notable stations, that of the Schlesisches Thor is from the designs of Griebach & Dincklage; and that of the Haleschen Thor was planned by Solff & Wichards. Bruno Möhring, the creator of the happy idea of exterior stone pillars in the Bülowstrasse, has carried out the Potsdamerstrasse station. His idea has been taken up for other portions of the line.

The line runs through 10 kilometres of the most important streets of Berlin. It will connect the workmen's quarters of the east with the pleasant west, and it may be noted that the "Architektonische Rundschau," whilst the line was in progress of construction and many of its features were becoming evident, spoke of it as in many respects a thing of beauty and an additional attraction to the town. "In this railway, as in bridge-building, it is being shown that both architects and constructional iron engineers can work effectively together." The late Werner von Siemens held this railway steadily in view for a long time, says the "Illustrierte Zeitung."

A New Building Exchange.—The new Exchange premises in Sunbridge Road, Bradford, for the members of the Bradford Building Trades and Stone Exchange, has been opened.

In the Chapel of the Savoy, London, a stained-glass window has been erected to the memory of Mr. D'Oyly Carte. It was designed by Mr. E. J. Prest.

New Baths at Old Trafford.—The Stretford Urban District Council have received the sanction of the Local Government Board in respect to their enquiry for borrowing powers to the extent of £14,000 for the erection and equipment of public baths at Old Trafford, Manchester, according to the designs prepared by Mr. Ernest Woodhouse architect, 88, Morley Street, Manchester.

R. I. B. A.

INLAY AND MARQUETRY.

BY W. AUMONIER AND HEYWOOD SUMNER.

A MEETING of the Royal Institute of British Architects was held on Monday evening last at No. 9, Conduit Street, Regent Street, W., Mr. William Emerson, president, in the chair. The minutes of the previous meeting having been confirmed, Mr. Emerson announced that the Council had decided to nominate Mr. T. E. Colclutt for the Royal Gold Medal, which the King, it will be remembered, decided should not be given to the family of the late Mr. Bentley. Mr. Colclutt's name will be submitted to the King, and after approval will come up for formal election at a later meeting. The following gentlemen were then elected members of the Institute:—As Fellows, Mr. Robert Langton Cole, of London, and Mr. James Miller, of Glasgow; as Associates, Mr. Alfred Ernest Biggs (Felixstowe), Mr. Walter Watkin Ellison (Erith) and Mr. Thomas Marshall Smith.

Mr. Aumonier's Paper.

Mr. W. Aumonier then read his paper on Inlay and Marquetry. He referred first to the two methods of making inlaid wood. The one is to cut the design which is intended to be inlaid, and the ground or field, out of various sorts of veneers, all of the same thickness, fitting and fixing them together by thin paper on one face, and laying this, the open face downwards, as a whole upon a solid ground or board. This is veneered work. The other way is to cut the design out in separate pieces as above, but out of wood $\frac{1}{16}$ in. to $\frac{1}{4}$ in. thick, using the same process of marking out, and then putting the complete print of the design on to a solid ground or board, sinking holes by carvers' tools the required depth, and driving the pieces in, thus making a "solid inlay."

In speaking of "marquetry" and inlay" it was never quite understood which sort of work was indicated—whether the solid inlay or the wholly veneered work. As the workmanship of each was so distinct, he would use the term "marquetry" for veneered work and "inlay" for the solid inlay above described.

The author then dealt with the technical side of the question, describing the old-fashioned process, and that now generally employed, of marking and cutting the design in the wood, shading, &c.

Colours and Design.

In his opinion strong contrasts or too many different colours on the same panel should be avoided, except, perhaps, in the case of ivory in ebony or mother-of-pearl in rosewood. One should depend rather upon soft harmonies, such as are seen in the best examples of Louis XVI. work, with their warm soft greys and yellows, or in the golden glow of the magnificent inlay in Pisa Cathedral.

A broad effect should be striven for, to be produced by the quality and colour of the wood itself and by the direction of grain in which each piece is placed. On no account should scratching or engraving be used on the surface of the inlay, least of all to express roundness or relief in form. Dealing with a flat surface, an absolutely flat treatment should be followed. One should not aim at too great fineness, or intricacies and complications of lines in the design. It is useless to try to emulate the painter and attempt to make too much of a picture—the material is against it.

Difference of the Two Methods.

The author went on to speak of the difference between the quality of marquetry and inlay, taking the words to bear the meaning above attached to them. "Marquetry," being wholly the work of the saw, is apt to become a little too soft and undulating, and perhaps a little bit flabby in parts, under the influence of that more or less mechanical instrument; while "inlay," being partly the saw's work, and, in part, the work of carvers' tools—cutting in and working by hand—is capable of receiving a stronger, more vigorous treatment of outline, and is therefore likely to reach an individual

and lifelike character of form unattained by the saw alone, which stamps it as finer work—from an art point of view; and even the occasional inaccuracies of fitting, and consequent different thicknesses of joints here and there, give it a distinct charm of its own. It also has a more pleasing quality of surface, especially as, in course of time, the inlay, being thinner, shrinks more than the solid ground, and thus becomes a little lower than the general surface, making a delightful play on the face of the work.

Solid inlay, with the inlay left in relief and afterwards carved, the author strongly condemned. Carving—as carving—is not improved by having its ground made of a different colour from itself. Inlay—as inlay—is not helped by having its surface frittered away by the undulations of carving. In conclusion, he urged them to sweep away all scratchy, uncharacteristic work, and get back to the face of Nature for inspiration in this as in other arts.

Mr. Heywood Sumner's Lecture

dealt with the simplest form of inlay in wood, namely, coloured wax stoppings, a form of inlay which has fallen into neglect. The Victoria and Albert Museum has some very fine specimens of old work of this kind. The effect is produced by incised lines, sunk spaces and dots, all filled in flush with green and red wax. Though, after the lapse of 550 years, some of the stopping has perished, yet the beauty of design yielded by the firm incisions remains, and these old examples show what fine things can be done in this method by artists who understand the graphic possibilities and the limitations of flat-surface decoration.

The Method Employed.

Mr. Sumner went on to describe the method he had employed in some experiments of his own in this kind of work. First trace the design on the panel of wood to be incised; cut it either with a V-tool or knife-blade fixed in a tool-handle; clear out the larger spaces with a small gouge, leaving tool-mark roughness in the bottoms for key; when cut, stop the suction of the wood by several coats of white hard polish. For coloured stoppings, resin (as white as can be got), beeswax and powder distemper are the three things needful.

Application of the Wax.

The melted wax may be run into the incisions by means of a small funnel with handle and gas-jet affixed; it is attachable to the nearest gas-burner by india-rubber tubing, so that a regulated heat can be applied to the funnel. When thus attached and heated, pieces of wax of the required inlay colour are dropped into the funnel, and soon there will be a run of melted wax dropping from the end of the funnel-spout, which is easily guided by means of the wooden handle, and thus the entire panel may be inlaid with the melted wax. Superfluous surface wax is cleared off with a broad chisel so as to make the whole surface flush.

The Suction of the Wood is Stopped

by means of white hard polish, otherwise the hot wax will enter the grain of the wood and stain it. Incised panels may be filled successfully with japanners' gold size and powdered distemper colour, using a palette knife to distribute the slab mixture. The melted wax, however, gives a more interesting and accidental result, and is better suited for designs that depend on spaces of colour-stopping for their effect. A close grain is the one thing needful in the wood. As to design, that which is best suited may be compared to a broad sort of engraving. Within certain limits, the manner of design is more free than is the case with inlay composed of veneers of hard material. The absence of beauty of material—e.g., pearl, ivory or choice woods—must be forgotten in the beauty, fancy and austere freedom with which the incised decoration is expressed.

A short discussion followed. Mr. J. D. Crace proposed a vote of thanks and referred to a somewhat similar method of inlay to that in wax described by Mr. Sumner in which a composition of glue, whiting and linseed oil was used as a kind of gesso.

Mr. Butler Wilson in seconding the vote spoke of inlay with marbles and metals. Mr. Emerson was surprised the inlay of the East—of India,

Egypt and Persia—was not mentioned, for he thought perhaps the finest examples were to be found there. The meeting then terminated.

ARCHITECTURE AND ART IN RUSSIA.

THE introduction of art into Russia was contemporaneous with the introduction and acceptance of the Christian religion. The first artistic activity was seen in the building and beautifying of churches. Russia's first teachers in the art of building were the Greeks, but in the north of Russia German artists predominated. Of the old monuments of building art which have been preserved up to the present time, the following are the principal:—The Kiev and Novgorod Cathedrals, founded in the eleventh century and built on the model of Sta. Sophia of Constantinople. Then follow the two cathedral churches in Vladimir—the Uspenia Bogoroditzi, built by Andrew the Pious; the other, St. Dmitri, built by Vsevolod III. These churches were built of white stone brought by water from Kamskoj, Bulgaria. On their outside walls is a reddish circle made of small half-columns. From the monuments of the founder's art we take the Korsun gate of the Novgorod Sophia Cathedral, made by German workmen in bronze. In the Sta. Sophia Cathedral at Kiev there remain still remarkable mosaics and frescoes done by Greek artists. From the twelfth century Russian historians begin to make note of Russian architects and image-makers. Thus a writer remarks of the renewal of the Susdalsk Church (1194) as an exceptional case, as the restoration of the church had been done by Russian hands and without the aid of Germans. As regards Russian domestic architecture, the houses were simple, small and poorly decorated within. They were of wood, and were divided into compartments, the one for sleeping and the other for eating. A wall separated the two rooms, covered by an awning stretched over pillars. Similar primitive simplicity reigns even yet amongst the peasants' homes. A corresponding simplicity is observable in the domestic utensils, the tables and benches being roughly made. The houses of the upper classes were distinguished also by great simplicity without, though decorated within. Being built of wood the towns were subjected to the risk of destructive fires and consequently few specimens remain of the old Russian architecture.—(Translated from Ilovaiski's "History of Russia.")

Sir John F. D. Donnelly, K.C.B., R.E., died on Saturday at the age of sixty-seven. He was an inspector for science from 1859 till 1874, director of science from 1874 till 1881, and from 1881 till 1884 assistant secretary of the Science and Art Department, South Kensington. In the latter year he was appointed secretary and permanent head of the department, and for the next fifteen years the direction and control of the Science and Art Museums at South Kensington were in his hands. He retired in 1889, when he was succeeded by Sir George Kekewich.

Architecture and Natural Scenery: The late Mr. Rhodes's Aims.—Mr. Herbert Baker, F.R.I.B.A., the architect of the new cathedral to be erected in Cape Town, speaks of the ennobling influence of natural scenery which was present in the mind of the late Mr. Rhodes in connection with every site he chose and every building he contemplated: such as a cottage he built, where poets or artists could live and look across to the blue mountain distance; a university, where young men could be surrounded with the best of nature and of art; a lion-house, a feature of which was to have been a long open colonnade, when the people could at once see the king of beasts and the lordliest of mountains; the Kimberley "Bath," with its white marble colonnades embedded in a green oasis of orange grove and vine trellis, looking to the north over illimitable desert. Such things would perhaps occur to most men, but with him they were a passion—almost a religion. He took pleasure in having the metal-work of his houses; hand-made by local craftsmen, and he started a tile manufactory near Cape Town for the main purpose of killing corrugated iron.

ALL SAINTS' VICARAGE, PLYMOUTH. THE LATE J. D. SEDDING, ARCHITECT.

DELAVAL CHURCH.

THE eight hundredth anniversary of the famous Lady Chapel in the grounds of Seaton Delaval Hall, Delaval (now the parish church of Delaval), was commemorated recently. The church is considered to be the only vestige now remaining of the original castle of the Delavals, and it is one of the purest and most perfect specimens of Norman architecture. The roof is the only part which has undergone any alteration. The Delavals remained true to the old faith until the close of the seventeenth century; and though their religion was proscribed, and the utmost penalties enacted against recusants, they maintained a chaplain to administer the rites of the Catholic Church to the scattered members of the flock. The exact date

of the dedication of the church is not certain; but the double row of zig-zag ornamentation on its two lofty Norman arches and the plain heavy capitals of its sturdy pillars fix the date of its erection at the end of the eleventh century, probably about 1090. With the exception of the rebuilding of the chancel wall in the fourteenth century, there has been no structural alteration. The two most interesting pieces of antiquity within the walls of the church are undoubtedly the recumbent effigies of a knight and his lady, supposed to be those of the founders Hubert De La Val and his lady, Richolda. The knight's chain armour, helmet and shield are all peculiar to the eleventh century, while the drapery of the lady is also distinctive of the same period. In 1892 the effigies were removed from the corners at the west end of the nave to the chancel within the

altar-rails. The church has been built on the typical Norman plan of nave, choir and chancel. Originally there had been two entrances, but now the western door only remains. This door has a sculptured tympanum, and a small zigzag indented label mould round it. High up in the wall above the doorway is a latticed window which leads to the belfry, in which originally there were two bells, but only one remains, which is believed to be a pre-Reformation bell, although there is no ornamentation on it. The window and the three armorial shields below it are protected from the weight of the high-pitched gable by a small arch. Inside the doorway are five shields of the same size and pattern. These shields each bear coats-of-arms, and are said to be the earliest we have in preservation in Europe. The windows are all modern. In the stonework round the small windows above the old doorway

is a portion of pre-Norman interlaced knot-work; time and exposure have almost obliterated the marking. On the north side of the choir are traces of either a doorway or a low window. High up on the north wall of the nave is an ancient Saxon window, now built up, which is of the greatest interest, from being one of the very few that are now to be found in England. For about 800 years it was the private chapel of the Delaval family. In 1891 it was presented by Lord Hastings to the people as the Delaval Parish Church.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Efflorescence on Brickwork.

BOLTON.—C. T. J. writes: "What is the cause of the white coating which appears after a time on new brickwork?"

See an answer to an enquiry about white efflorescence on brickwork on p. 451 of our issue for February 12th last.

Cubing a Building.

HOVE.—R. writes: "Which is the usual method of taking the superficial area of floor space and also the cubical contents of a house?"

The superficial area of floor space is found by taking the measurements of each room separately from wall to wall, squaring, and adding together. The walls are not taken account of. Measurement of a building "per square" for rough pricing is, however, obtained by taking the dimensions from out to out of the walls at the ground level, so as to include any projection of the plinth or other set-off. The cubical contents of a building are usually found by taking the dimensions from out to out of walls and from half the depth of footings to half-way up the roof.

Architecture and Surveying.

HASTE writes: "I have a smattering of both architecture and surveying, and am a fair draughtsman. (1) Which profession do you consider advisable for me? I am too old for a longer apprenticeship than two, or at the very most, three years? (2) Is there as much to learn in surveying as in architecture? (3) Is it usual to be apprenticed to surveying? (4) Are there many offices where surveying only is done, or is it usually coupled with architecture or civil engineering?"

(1) We think you would have perhaps a wider opening in the architectural profession, but both professions are crowded, and unless you have considerable attainments you are not likely to succeed. The building trade will, we think, offer the greatest chance, and the little smattering of professional subjects would be found very useful. (2) No. (3) Yes; the general term is three years. (4) A practice in surveying alone large enough to be remunerative is difficult to get, and a surveyor usually engages also in the businesses of estate agent, quantity surveyor, architect or civil engineer.

Libraries, Baths and Washhouses.

SWANSEA.—H. writes: "(1) What would be an approximate price per ft. cube of a library and baths combined, say, for a village? (2) How are public washhouses arranged?"

(1) 11d. or 1s. per ft. cube. (2) See R. O. Allsop's book on "Public Baths and Washhouses" (B. T. Batsford, price 5s.).

Agreement between Builder and Building Owner.

EASTON.—G. D. writes: "Kindly give a few particulars about preparing an agreement between builder and building owner."

See the section "General Conditions" in "Specification, No. 5."

Architectural Formulae.

MANCHESTER.—J. S. W. writes: "What are the best formulae to commit to memory, for examination purposes, in order to calculate the strengths of the columns, girders, &c.?"

See Hurst's "Architectural Surveyors' Handbook" (E. & F. N. Spon, Ltd.).

Engineering Notes.

The Works in connection with the Whitechapel and Bow Railway have been so far completed that last week ballast trains were able to travel from end to end of the line.

The Haverigg School, Millom, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with Shorland's patent Manchester stoves, exhaust roof ventilators and special inlet tubes.

Electric Trams in Manchester.—During the last few months rapid progress has been made by the Tramways Committee of the Manchester Corporation with the work of preparing for the gradual extension of the electric tramcar service. The next route to be opened for electric traction will be that from the Town Hall along Princess Street and Upper Brook Street to High Street, upon which horse cars are now running. The overhead system has been adopted.

The New Station at Newmarket of the Great Eastern Railway Company, which is a quarter of a mile nearer the racecourse than the old one, was opened last week. The new station, which has cost nearly £10,000, has a platform nearly a quarter of a mile long on each side of the rails, and also a dock at the Bury end. The premises will be lighted by electricity. The principal approach to the station is by the new road from the High Street. From this road, which is on the west side of the Jockey Club premises, a residential block of buildings has been erected for the King's use. At the Grand and July Stands, on the Heath, fresh Royal accommodation has been provided for his Majesty.

The Great Reservoirs between Ashford and Staines, whence it is understood three of the Metropolitan companies—the Grand Junction, West Middlesex and New River—are to be supplied with additional water taken from the Thames above Staines Bridges, are now much advanced. After running from the intake for a mile or so along the aqueduct to the powerful pumping station near the London Road, Staines, the water will be forced into the storage reservoir, and pass thence as required to the filtering beds at Hampton, lower down the river. The works, which are being carried out by Messrs. J. Aird & Co., are of an extensive character, and have already occupied several years in construction.

Mr. William A. Valon, J.P., M.I.C.E., has resigned his position as engineer of the Ramsgate Gas and Water Undertakings, in consequence of his consulting and Parliamentary practice becoming so large as to require the whole of his time. Under Mr. Valon's guidance the Ramsgate Gas and Waterworks have achieved great success, financially and otherwise. He first introduced a constant water-supply, and during his management nearly all the water mains have been relaid. He was the first to adopt the prepayment-meter system of gas supply and he was responsible for connecting the East and West Cliffs by new roads.

Builders' Notes.

The Aberdeen Master Masons' Association held its annual dinner recently. Mr. Robert Slessor presided.

Mr. Clement Wallworth, builder and contractor, of Gorton, died last week at the age of fifty-three years.

A Misquotation.—A firm of Blackpool builders recently quoted 3s. per yard for brickwork upon the supposition that the yards were to be measured superficially instead of cubically. The Blackpool Council decided they should pay for the mistake, though a feeling was expressed that the ratepayers might stand in to the extent of half the difference. As a result the Blackpool people have got a cheap chimney at their electricity works.

Mr. James Gordon, manager of the Aberdeen Building Co., Ltd., died last week. He was born at Cullen in 1838. Mr. Gordon went to Aberdeen about forty years ago as foreman to Messrs. Smith, shipbuilders. He remained in the capacity of foreman for ten years, and afterwards for a short time carried on business as a building contractor on his own account. Subsequently he was appointed manager of the Aberdeen Building Company, a position which he held for sixteen years down to the time of his death.

The Farnworth and Widnes Brick and Tile Company has opened new works at Farnworth. The company was started with a capital of £10,000, and the works have now been completed. The land on which the works are situated consists of 13½ acres and contains a valuable bed of clay, sufficient to last fifty years. The site is alongside Farnworth Station, on the London and North-Western Railway, and a siding has been made into the company's works. The machinery is of the most modern type for the most economical production of bricks and tiles, and an output of 25,000 bricks per day has been guaranteed. There are three kilns, one being of considerable dimensions, and there is also a drying shed 112ft. by 110ft., and capable of holding 120,000 bricks. The arrangements have been carried out by Mr. J. Buchanan, M.I.M.E., consulting engineer, of Liverpool.

Collapse of a Building.—Some new business premises which were being erected in the centre of High Street, Barnstaple, for Mr. J. T. White, as a warehouse, collapsed recently. The building was three storeys high and was of red brick, with limestone dressings. The front and walls were finished, the roof was on, and much of the interior work was done. The collapse was complete, nothing remaining but a heap of debris, some of which scattered over the road and smashed the plate-glass windows of the shop opposite and the smaller window of an adjoining house. The scaffolding was still standing. The collapse is attributed to the giving way of one of the pillars built of brick, faced with limestone, bearing an iron girder over the shop front which carried the weight of the greater portion of the building. The damage is estimated at £600. The contractors are Woolway Brothers, who are also building the new Barnstaple Post-Office. The original architect was Mr. F. W. Petter, but Mr. Nash has recently acted in that capacity.

All Saints' Vicarage, Plymouth.—The planning of this vicarage by the late J. D. Sedding is suggestive and interesting, while the treatment of the exterior is distinctive of the man, being full of that vigorousness and thoroughness which Sedding displayed in all his works.

APHORISM FOR THE WEEK.

*But see, a noble shelter here,
This grand arcade where our Venetian
Has formed of Gothic and of Grecian
A combination strange, but striking,
And singularly to my liking!*
CLOUGH ("Dipsychus.")

Our Plates. THE branch bank at High Barnet is a red brick and Portland stone building. It was built in 1897 for Messrs. Barclay & Co., Ltd. It was designed by Mr. Arthur C. Blomfield, M.A., F.R.I.B.A., Messrs. Dove Brothers being the builders.—The houses in Derby Road, Nottingham, were erected for Mr. Leonard Tideswell. The site was a very awkward one, and the houses had to be set forward one in front of the other, owing to the limited space. The buildings are of red sand bricks, and are covered with green slates, all the woodwork being painted white. Unfortunately the buildings are somewhat marred by the ugly finish of the boundary walls which Messrs. Brewill & Baily's client erected.—The illustrations of the new overhead railway in Berlin illustrate the article on p. 116 of this issue.

Honours for an English Architect Abroad. CAVALIERE WILLIAM SCOTT, of Bordighera (R.I.B.A. Medallist and Travelling Student, 1877), who recently received the decoration of the Crown of Italy, has been unanimously elected an Honorary Associate (Accademico d'Onore) of the Royal Academy of Fine Arts of Venice (Regia Accademia di Belle Arte in Venezia), the diploma being accompanied by a gracefully-worded letter of appreciation and esteem.

Grey Friars Church, Newgate. A MEETING of the Royal Archaeological Institute was held recently, when Mr. E. B. S. Shepherd read a paper on "The Church of the Grey Friars at Newgate," where this Order had a home for nearly three hundred years, when their Foundation was turned to educational uses by King Edward VI., who founded Christ's Hospital. The Friars came to England in 1234; four made their way to London, and acquired a house in Cornhill. Soon after, land was given them near Newgate Street, and they built a church, which was replaced by Queen Margaret's Church in 1306. This had fifteen windows on each side, and three at each end; it was 300ft. long by 89ft. wide and 64ft. high. It was ceiled in 1420 at a cost of 200 marks, and the pavement was of marble. The chief authority for the history of the Foundation was a manuscript in the Cottonian Library, of which more use had been made for genealogical purposes than to discover the architectural features of the old church. Mr. Shepherd referred to diagrams showing the ground-plan—the choir separated by a narrow passage from the nave, and compared it with the church of the Black Friars at Norwich. The Cottonian manuscript contained a list of burials, and on another plan the position of the stones in the church was laid down. The church was probably not vaulted, nor had it originally a clearstory. One was shown in some old drawings, but, if these were correct, the clearstory must have been added at a later date. The church had a tower, not improbably like that of the Greyfriars at Lynn, but no trace of it remained.

A Wickerwork Scaffold. THE Parish Church of St. Mary, Islington, which has for some time shown signs of decay, is now reported to be in an unsafe condition. It is therefore to be pulled down and entirely rebuilt. The original parish church of Islington was built about 1483. In 1751 it became dilapidated and was demolished, the present building being then erected at a cost of £7,340. It was found necessary in 1787 to strengthen the tower, and the following interesting account of the work is given by Nelson: "Thomas Birch, a basket-maker, undertook, for the sum of £20, to erect a scaffold of wickerwork round the spire, which he formed entirely of willow, hazel and other sticks. It had a flight of stairs within, ascending in a spiral line from the octagonal

balustrade to the vane, by which the ascent was as easy and safe as the stairs of a dwelling-house. This ingenious contrivance entirely superseded the use of a scaffold, which would have been more expensive, and is frequently attended with danger in works of this kind. The spire on this occasion presented a very curious appearance, being entirely enveloped, as it were, in a huge basket, within which the workmen were performing the necessary repairs in perfect safety."

Victoria Station to be Enlarged. HOUSES on the east side of Buckingham Palace Road, adjoining Victoria Station, are now being demolished to make way for enlargements. The railway company has acquired the whole of the property on that side of the road from the Grosvenor Hotel to within a few yards of Ebury Bridge, and the side wall of the station will in future form that side of the thoroughfare. This will add about eight acres to the station space, provide platform accommodation for eighteen trains, against eight at present, and enable four lines to run right into the station. To begin with the open space in front of the station, this will be increased by nearly half its present area, the front of the station being set back so as to be flush with the front of the Grosvenor Hotel. The space will also be relieved of cab traffic, as entrances and exits will be provided in the Buckingham Palace Road. Facing this open space, and having a common frontage with the hotel, will be the company's booking and other offices, on a site 240ft. by 55ft. The floors above the offices will form an extension of the hotel, which is the property of the railway and let to the Gordon Hotels Company. Passing through the booking hall, the visitor will come to an open "circulating space" 240ft. wide—the full width of the station—and 100ft. deep. Then beyond this will be the platform gates, and the platforms will extend under Eccleston Bridge and as far as Elizabeth Bridge. Both these bridges will be raised to give greater headway beneath, and in order that the gradients may not suffer Buckingham Palace Road will be gradually raised towards the approach to each bridge, where it will be 5ft. above its present level. Cabs will enter the station to take passengers at Elizabeth Bridge, leaving the station at a point nearer the Grosvenor Hotel. This great extension of the station will cost about a million sterling, and will form part of the scheme for widening and improving the line from London to Brighton which is at present being carried out.

Norman Frescoes Discovered. AN archaeological find of considerable interest has been made during the preliminary work in connection with the restoration of Claverley Church. Claverley is a little village close to the ancient town of Bridgnorth, which, in turn, is about 14 miles from Wolverhampton. The church is a queer plastered edifice, with a carved oak three-decker pulpit, oak pews and private chapels on each side of the nave belonging to the Gatacre family, and containing curious brasses and alabaster tombs. During the past few weeks a body of workmen have been employed clearing out the interior and stripping the walls. The pews, pulpit and other objects have been carefully taken down, the walls bared to the stonework, galleries removed and the floor taken up. The work has resulted in several discoveries. The most interesting of the discoveries is a Norman fresco, or mural painting. Down one side of the nave run three Norman arches, which are generally considered the oldest portion of the church. The tops of these have been hidden by the gallery which was put in front of them, and the fine pillars have been badly hacked to make supports for the joists. The fresco runs along the top of the arches, just where it might have been expected from similar works brought to light in other churches. Unfortunately, it has been irretrievably ruined. At the Reformation, or before, exception seems to have been taken to the crude pictures, and they were whitewashed over, and huge shields and other devices painted on. These, in turn, have been coloured, plastered and otherwise hidden, and other inscriptions put on. So the process has gone on, until now it is impossible to get the mass off without damaging the Norman work, and it can only

be brought faintly to light in patches. It is identical in treatment and general idea with the famous Bayeux tapestry.

Dover's Roman Pharos. THE Roman pharos which adjoins the ancient church of St. Mary in the Castle, stated to be the oldest church in England, was constructed about 43 A.D. There were originally two of these beacons: one on the western heights and one at the Castle—that is to say, one on either side of the valley, which, in olden times, formed the banks of an inlet which flowed from the sea. The pharos on the western side of the town has long since disappeared, nothing remaining except its foundations, but the pharos at Dover Castle is in a fair state of preservation. The structure is built of Roman bricks and mortar, and historians believe that the tiles were probably brought from abroad. The pharos is octagonal on the exterior. The interior of the building, however, is square, each side measuring about 14ft. The thickness of the walls in the lower part is 10ft. It is impossible to say how high the pharos was originally, but it is represented as having had five storeys. The present height is about 40ft. It was discovered by excavation that the building was originally connected with the church by an underground passage. At the present time the Royal Engineers are roofing in the tower with a view to preserving it from the effects of the weather.

Stained Glass and the Artist. MR. REGINALD HALLWARD has completed a new stained-glass window for St. Etheldreda's, Fulham. It is almost the first instance since the sixteenth century of a window in which every process has been carried out by the artist himself. True, in the early days of the Oxford Movement one or two enthusiasts established their own kilns, but these were amateurs, influenced by the right spirit but without the necessary technical training. The leading and the firing is usually done at a factory, the result being that the leading bears the same relation to the work of the artist's own hand as an engraved copy-book heading bears to a well-written but characteristic signature. The lead is of uniform thickness, perfect in its lines and curves, and absolutely expressionless. On the other hand, when the artist personally does the leading, whether he uses it for outlining or to enforce effects by contrast and opposition, or to give depth and richness to a piece of decorative colouring, he controls the form and thickness of the lead at every point. That the artist himself should fire the glass in his own kiln is quite as important; the artist who drew the picture should be able to control the process so as to give the best effect to every piece. Mr. Hallward's window at St. Etheldreda's consist of two, out of a series of sixteen, pictures he is making to illustrate the life of the patron saint.

A Submarine Archaeological Survey. THE British Consul at Naples remarks in his report for the past year that it is strange that, in spite of all the interest taken in Southern Italy, and especially near Naples, in archaeology and exploration, no definite chart has ever been made of the important Roman remains beneath the sea, which stretch almost without interruption from Naples to Baia. It has been left to the British Association to undertake this, and under their auspices Mr. T. R. Günther, of Magdalen College, Oxford, has been engaged for some months in making a detailed survey of the Roman structures beneath the sea, from which it would appear that the sea-level has risen about 20ft. since those days, and has covered many villas and piers, and probably also a road, which seems to have existed along the coast of Posilipo. Mr. Günther's survey, says Mr. Neville Rolfe, will be of great practical value, apart from its scientific interest, because many boats run upon those old foundations annually.

The New War Office. when finished, will contain about 400,000 cub. ft. of worked Portland stone and 4,000 tons of steel (all English); while no fewer than 25,000,000 bricks will have been utilised. Messrs. Foster & Dicksee, of Rugby, are the contractors.

THE PREVENTION OF DAMP IN WALLS FROM EXTERNAL CAUSES.*

By JAMES MCLEOD.

THE question of excluding damp from walls is one of admitted importance: a dry house is a healthy house, a damp one nothing less than a dangerous dwelling, for damp is one of the most prolific and most generally acknowledged sources of disease. A damp wall checks the passage of air through its pores, is cold, and the evaporation from it lowers the interior temperature of the building, and consequently occasions a rapid radiation of heat from persons dwelling within its influence. This combination of damp and cold renders the building most unhealthy, and its inhabitants are liable to colds of every kind. Besides being so unhealthy, damp walls are uneconomical, by reason of the great absorption of heat by the evaporation of the moisture from their surface, and the consequent increased consumption of fuel required to keep the interior of the building warm. Dampness also causes an early decay in the materials used for the construction of the building. The decay of stone or brick is almost invariably the result of damp, either by its own action—by the freezing of the water in the walls—or by the acids which are conveyed into the stone by the moisture. The damp in masonry also communicates itself to the woodwork, and causes rot throughout the building. It also causes the discolouring of the plaster and painter-work, spoils the interior furnishings, has a most destructive influence on books, and altogether renders the building most unwholesome.

These matters are of no moment to the man who builds to sell and cares not how soon his work goes to pieces, but they are of the greatest importance to the occupier, who wishes a healthy home.

With the good building material which we have at our disposal in this district damp is an evil which we never reckon on in our work, and one which should give us little or no trouble, provided good material is put into the work and the workmanship is properly done. The materials in common use with us are stone, brick, timber and, occasionally, concrete.

Stone and brick are chiefly used, and these I shall deal with mostly; concrete is employed in places where those other materials are not easily obtainable, or for special purposes. Timber is only used for temporary structures, and need not be considered by us.

The treatment of stone and brick walls for the exclusion of damp is in most cases similar.

Causes of Damp.

The walls of a new building are always damp. The quantity of water which is conveyed into a wall in the process of building is very great. Suppose, for instance, that 100,000 bricks are used in the construction of a wall, each weighing 7lbs. Even a good brick can suck up from 10 to 20 per cent. of its weight in water, but let us assume 10 per cent. as what gets into it by the manipulations of the bricklayers; also assume that the same amount of water is contained in the mortar, a quantity much understated. The mortar forms one-fifth of the wall; thus nearly 100,000lbs. of water, equal to about 10,000 gals., may be assumed to be put into the wall in the process of building.

The absorbing power of good sandstone is little less than that of brickwork; most limestones are very porous; Portland stone is said to be capable of absorbing 14 per cent. of its weight, and Bath stones as much as 17 per cent. This does not allow for the water in the plaster and other work, and can be taken as a fairly moderate estimate; and this moisture must be removed before the house is habitable. This is effected by firing the house, which should on no account be occupied till this is done, as the operation causes the air to become saturated with the moisture drawn from the wall; rendering it most unhealthy. A thorough draught of air greatly assists the drying of the interior of the building.

When walls have thus been freed from this

initial damp it is their proper function to prevent water again entering from the outside, but as the external surface of the wall is always exposed to the elements, and as all building materials are more or less porous, the rain driven against the wall will penetrate into it. The water thus communicated to the wall is partly evaporated out again by the action of the sun and air and partly drawn through it by a capillary attraction, and if the material is very porous or the wall very thin this may saturate it. This is the chief cause of damp. It is not necessary, however, that it rain to convey damp to a wall. In the atmosphere itself there is always a certain amount of moisture, which varies with every degree of temperature; the amount increases as the temperature of the air rises. When the proportion of water in the air is greater than it can dissolve or hold, the atmosphere is said to be damp, but when the air can dissolve all the water it is called dry, notwithstanding that it still contains water.

During the heat of a warm day the atmosphere may be clear and apparently dry, although it really contains as much water as it is capable of dissolving at that temperature. Whenever the air is cooled, as for instance at night, it becomes unable to hold as much water as it did in the heat of the day, so that some of the water is discharged and becomes dew, mist, and even rain, according to the degree and rapidity of the cooling process; and as all bricks, stone and similar materials are capable of absorbing this moisture from the air it is easily seen that it is possible for a wall built of very absorbent materials to be always damp, even in an atmosphere which seems to be dry.

One of the chief evils of this saturation of the wall is to cause decay in the material used.

Some of the water which has been deposited in the stone (or brick) is again drawn from it when the temperature rises. This causes a constant flow of moisture in and out of the stone, which gradually loosens the particles and allows the stone to crumble away. The action of frost, which tends to disintegrate the stone by the expansion in the freezing of the water enclosed in its pores, also causes the separation of the particles, and even in the absence of chemical action decay may result from that alone.

In addition, the water acts as a carrier of chemical agents, such as carbon-dioxide, carbonic, hydrochloric and sulphureous acids, all common in the atmosphere of towns; and these hasten the decay of the stone. Sandstone and bricks, being acid material, are not easily attacked by these gases; limestones on the other hand are easily corroded. Other things being equal, the more porous a stone the more easily it will be corroded. This combination of mechanical and chemical action often causes the decay to begin on the surface; this is not however always the case. It often happens that decay begins within the surface of the stone.

At a distance varying, according to its porosity, from $\frac{1}{8}$ in. to $\frac{1}{2}$ in. from the surface of the stone there is a critical place beyond which the water does not usually pass, and where it always remains longest. It is here, not actually on the surface but behind it, that the decay generally begins. As it progresses it throws off a scale, which is often found to be in good condition on its outer surface, although the inner surface is rotten. A kind of scale of disintegrated particles is laid bare, which is more absorbent than the healthy stone, and assists and promotes the progress of decay, which, if not arrested, will proceed with greater rapidity than ever.

Although there are some exceptions, it may be laid down as a rule that the universal cause of decay in stone is damp or the evil influences associated with or conducted by damp.

I have here taken stone as an example. Bricks are also liable to decay in exactly the same manner, and an inferior brick will decay quickly under these circumstances.

This saturation of the wall with rain or moisture from the atmosphere is the chief cause of damp, but if the materials used are of good quality and are capable of throwing off the damp quickly, little or no harm will be done. If good materials are not to be had, that which is at our disposal must be protected as much as possible; and it is some of the remedies for such cases that I have here noted.

Before passing on to them I might mention

the damp which is occasioned by inferior workmanship. Carelessly-fitted windows and window sills are a ready source; roughly-finished pointing may also let the water into the wall; but the chief evil is that of badly-constructed plumber work, or the omission of a damp-course in a chimney head or in a parapet wall.

When sea-water is used in the mixing of concrete for walls, it may cause an efflorescence, which is sometimes comparatively harmless, but which has a tendency to cause damp places in the structure that may lead to the destruction of plaster and paint, or perhaps to the detachment of fragments of the wall.

Cures.

Time is the only real test of the various methods adopted, and as few records are kept of these it will be seen that when one is called upon to find a remedy it will be necessary to select one which is most likely to suit the particular needs of the case, and which is likely to have the most permanent effect.

If the material is known to be inferior before the wall is built of it, several methods which I will describe can be used with effect; but if the defect is only noticed after the building is completed the remedies which can be applied are mostly of a temporary nature and require frequent renewing. It is therefore best, if there is any doubt as to the material, that some method should be employed to ensure that the interior of the building is kept dry.

If possible, the damp should be arrested on the surface of the wall, or it should be obstructed as near the surface as possible, so as to ensure that the greater portion of the wall is kept free from the damp.

Hollow Walls.

One of the most effective methods employed for brickwork is that of building hollow walls. As you all know, the common way of building these is with the $\frac{1}{2}$ in. wall divided from the main wall by an air-space of $\frac{1}{2}$ in. or 3 in., the two tied together by bonding bricks or metal ties. The $\frac{1}{2}$ in. portion of the wall is usually built on the outside of the main wall. The metal bonding ties are supplied in many different forms of cast and malleable iron and steel. A strip of steel, twisted in the centre to stop the passage of the water and turned up a little at the ends to form a key in the joint, makes a good tie. All metal ties should be galvanised to prevent corrosion and consequent loss of strength, and the little cost involved is compensated by the lasting power of the tie.

It is a good plan to leave openings in the brickwork at the foot of such walls, so that at the finish of the work the bottom of the air-space may be cleaned of the droppings and rubbish which may have accumulated during the building. These holes may be afterwards built up, or they may be covered with gratings to form ventilators.

The advantages of hollow walls are that they prevent the damp penetrating the wall further than the air-space, and if the thin portion is placed to the outside the damp is kept from the greater portion of the wall and at a greater distance from the interior of the building.

The air-space not only excludes the damp, but it acts as a non-conductor, which helps to keep the building warm.

The introduction of a vertical damp-course into the interior of the wall is another method which may be adopted. It consists of melted bitumen or asphalt run into the joints of the brickwork as the wall is being built, forming a continuous sheet of waterproofing material in the interior of the wall. This makes a very satisfactory job, and if properly done it will keep out the wet most effectively.

Cement Rendering and Tiles.

Of the various ways of waterproofing existing walls, Portland cement rendering is perhaps the most common with us. If this is carefully done, it is certainly successful, although the effect is not generally pleasing; 3 parts of good sharp sand to 1 of cement makes a good plaster, and care should be taken that the wall is rough enough to form a good key for it, or it may scale off after a time. It may be finished with a rough-cast or a smooth trowelled surface. This plaster is not of itself damp-proof, but the smooth surface formed throws off the water quickly and does not allow it to penetrate into

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society on March 21st, 1902.

CHAPEL OF THE ASCENSION, BAYSWATER ROAD, LONDON, W.: FRONT. HERBERT P. HORNE, ARCHITECT. (Photo: H. Irving.)

the wall. The rough-cast work is therefore not so good, as the water retained in the inequalities of its surface may be blown or drawn into and through the wall. Roman cement may be used for this work in a proportion of 1 of cement to 1 of sand. Artisans' dwellings may be built very cheaply of inferior stone or brick faced in this manner so as to render them damp-proof.

Tiling is a good and cheap method of protection, which may be applied to new or old walls. The tiles are hung on laths, which are plugged to the wall, and they are lapped as in ordinary roofing work. It is not our custom to treat our walls thus, and I have not seen it used except for ornamental work on the upper storeys of villas, &c., but I understand that it is a very common practice in some parts of England.

The setting of tiles in cement on the surface of the wall is not a reliable practice. The tiles, to effectually throw off the water, have to be glazed, and the danger is that the least imperfection in the glaze allows water to enter into the body of the tile, which, expanding by freezing, causes the glaze to scale off and thereby renders the tile useless for the purpose intended.

Preservative Solutions.

A great number of paints and solutions have been tried for the waterproofing of stone and brickwork, but none of these seem to have come into general use. The application of a fatty or oily varnish, which will sink into the wall, will render the surface non-porous, but since most of these materials are themselves less durable than the stone, repetition of the process at intervals will be found necessary. A mixture of linseed oil and paraffin painted on the work in two or three coats will fill the pores and keep the stone dry for a time, but it discolours the stone badly. Paraffin wax applied hot and in solution with coal-tar naphtha may also be used.

Browning's solution is another of this order; it is composed of—

85.5 benzoline.
10.0 gum dammar,

2.0 wax.
2.0 sugar of lead.
.5 corrosive-sublimate.

This is another solution:—

2½ lb. of soft soap.
1 lb. rock alum.
1 gallon linseed oil.

The soap and oil to be boiled over a good fire a considerable time, till perfectly amalgamated. The alum to be finely-pounded and mixed with the oil in small quantities at a time, and the mixture to be constantly stirred until the alum is incorporated with the oil and soap. When this is done the mixture to be strained off into cans for use. It is very important that the walls should be perfectly dry when the mixture is applied.

The following is another recipe given for damp walls, though I cannot testify to its efficiency:—Take ½ lb. mottled soap to one gallon of water, to be applied *boiling* over the surface with a brush (not to be frothed); leave it for twenty-four hours to dry; then apply ½ lb. of alum to 4 gallons of water, leaving it for twelve hours to dissolve, and to be laid on as before. Hot weather is best for the application.

Ransome's method is to coat the stone with a thin film of silicate of lime. This is done by first washing the surface with silicate of soda; the surface is then played on with a solution of chloride of calcium, when a chemical change immediately takes place, the silicate of soda changing into silicate of lime, which is insoluble, and the chloride of calcium changing into chloride of sodium (salt), which is soluble in water and is easily washed off.

The Bath Stone Firms supply a material called fluat of magnesia for treating limestone; it is especially adapted for use on the stone taken from their quarries, but it can be used on any limestone. The crystals are dissolved in water and applied to the surface of the stone. As soon as it touches the stone it sets up a chemical action in the carbonate of lime, which forms a substance that prevents

the penetration of water. This firm also sells a special liquid for the treatment of materials which do not contain carbonate of lime. This solution, called Avant, deposits on the surface treated the lime necessary for the fluat of magnesia to act upon. By alternate dressings of these two solutions the same result is obtained as if the substances were naturally of a calcareous character. Both of these treatments are said to cost about 1d. per ft. super. of surface treated.

A solution which seems to have been successful in some cases is supplied by Szerdmeij & Co., of London. The manufacturers claim that their liquid thoroughly waterproofs the stone for all time without altering the appearance of it. This liquid is at present being tried on our municipal buildings, and we will have an opportunity of watching if a satisfactory result is obtained.

Several preparations of a different sort are supplied by Messrs. Blundell, Spencer & Co., Ltd., of Hull. One of these they call their transparent petrifying liquid, and they claim for it that while it does not materially alter the appearance of the material to which it is applied it renders stone, brick or cement impervious to moisture and to the deleterious gases of the atmosphere of towns.

Another preparation supplied by this firm is a bright drying liquid which may be had in various tints, and it imparts an enamel-like surface to the wall. This is mostly used for internal work, but for external work it can be got to dry with a dead flat surface to resemble the natural appearance of brick or stone.

Painting with ordinary oil paint is a common method of keeping damp from penetrating a wall, but as the work has to be re-done every two or three years, depending on the locality, it cannot be an economical method.

With reference to the use of those preservative solutions which render the stone or brick impervious, it may be said that ordinary structures of untreated porous material—although absorbing moisture readily—allow its egress to

take place just as readily and offer no hindrance to the transfusion of air through their walls.

A building with impervious walls, although excluding damp from without, includes internal damp and allows no ventilation through its pores.

Eaves, Cornices, Gutters, &c.

So much for the treatment of the walls themselves. I come now to the remedies (or rather the precautions which have to be observed) in the constructional work.

Projecting eaves are an advantage, and the more they project the more protection they offer to the surface of the wall. The objection to them is that they shade the wall from the drying influence of the sun's rays; thus damp which does get in is retained in the stone and causes rapid decay.

Cornices and all projections should be constructed to throw off the rain by means of throating and weathering, and everything should be done to keep the water off the face of the building.

All masonry, such as chimneys and parapet walls, should be provided with a suitable damp-proof course just at the roof level to prevent the rainwater from getting into the wall beneath. The rainwater gutters should have a sufficient fall to carry the water off quickly; they should be examined frequently and kept clean. The down pipes should be large enough to convey the maximum flow and prevent the frequent overflow of gutters.

In case of stoppage in gutters or down pipes overflows should be arranged, and these should be of sufficient length to throw the overflow water clear of the wall or projecting parts of it. Snow-guards should always be placed in gutters behind parapet walls and similar positions where the snow is likely to lodge and check the flow, and these should always be arranged to give a good run of water. These snow-guards should always be constructed of creosoted timber.

In conclusion, it must be evident that it

always pays to use only the best material and workmanship in the building, as patching is always unreliable, and it is often found that it costs more to make good bad work than it would have cost had it been done right at first.

CHAPEL OF THE ASCENSION, BAYSWATER, LONDON.

THE Chapel of the Ascension, Bayswater Road, London, W., is a "Chapel of Rest," no services being held there. It was designed by Mr. Herbert P. Horne and is decorated inside by Mr. Frederick Shields. At the request of the late Mrs. Russell Gurney, the architect and the painter made a tour to some of the cities of Northern Italy, and the beautiful façade of the principal church of Pietra Santa, in the Carrara district, was specially noted as suggestive of the kind of design desired by Mrs. Russell Gurney.

The only serious difference of opinion which arose between Mr. Shields and the architect as to the plans of the chapel was in connection with the lighting. Mr. Horne had provided for side windows, Mr. Shields strongly desired top lights. Eventually a compromise was arrived at, the windows being placed very high up along the north and south walls. The decorations are in oil painting, the plan adopted being that of riveting blocks of slate to the walls, leaving an air chamber behind, and then affixing the paintings to the slate with a composition of white lead, &c., after the manner practised by M. Puvis de Chavannes at Amiens. Gas having proved most destructive to oil paintings, it was provided in the deed of gift that no artificial light should ever be introduced into the Chapel of the Ascension, the hours of daylight being sufficient for the purposes contemplated. Thus, also, with the addition of an iron door to the organ loft, every possible precaution has been taken against the calamity of fire.

THE PARIS "METROPOLITAN."

LEUT.-COL. H. A. YORKE, Chief Inspecting Officer of Railways to the Board of Trade, has just presented to that body his report on the Chemin De Fer Métropolitain De Paris. The line already constructed is part of a scheme which will form a complete system of inter-communication between the different portions of the city of Paris. The complete scheme comprises a system of railways in shallow tunnels, having a total length of 38.86 miles, namely, a circular line more or less parallel to but nearer the centre of the city than the Ceinture Railway; two lines on the north side of the Seine traversing the city from east to west, and touching the circle line at each of their extremities; two lines traversing the city from north to south, and crossing the east-west lines. Only a short length of the system is at present open for traffic. The total cost of the entire scheme contemplated will be about £12,000,000. The authorised fares are 25 centimes (2½d.) first-class and 15 centimes (1½d.) second-class for any distance. Second-class return tickets, available for the rest of the day, are issued at 20 centimes (2d.) up to 9.0 a.m. The stations are mostly in arched tunnels having a clear width at the springing of 46ft. 6in. and a height above rail-level of 16ft. 5in. The station platforms are 24ft. long, sufficient to accommodate trains of eight coaches. The railway is worked by electricity on the (500 volt) continuous-current system. The tunnels were constructed as near the surface as possible, but the depth varies. As a general rule the top of the arch is about 3ft. 6in. below the surface of the street, but where the line passes below the main sewers of the Boulevard de Sebastopol and of the Boulevard d'Asnieres, or where one line crosses another, the depth is very much greater. On the other hand, the railway emerges into the open near the Place de la Bastille, and crosses the Canal Saint-Martin by means of a bridge. The whole of the

CHAPEL OF THE ASCENSION, BAYSWATER ROAD, LONDON, W.: FROM THE NORTH-EAST. HERBERT P. HORNE, ARCHITECT. (Photo: H. Irving.)

tunnelling, except at some of the stations, is arched, the side walls, arches and inverts being built of rubble masonry. The width of the tunnel for a single line is 12ft. 9 $\frac{1}{2}$ in., and for a double line 21ft. 8in., at rail-level. The underside of the arch is finished with a coat of Vassy cement $\frac{3}{4}$ in. thick, and the walls and invert with Portland cement. All the tunnels are whitewashed inside, and the stations are lined with glazed white tiles.

Dealing with the question of subways or tunnels as compared with the deep-level tube, Colonel Yorke says: "It cannot, I think, be doubted that, as regards the convenience of passengers and economy of working, the balance of advantage lies with the shallow tunnel, or subway, as compared with the deep-level tube. It is easier of access, affords greater opportunities for escape in case of a breakdown or accident, and possesses a purer atmosphere; but the difficulties of constructing such subways along the principal streets in London are formidable. Where, however, new thoroughfares are in process of formation, the obstacles to shallow subways are not so serious, and advantage may well be taken of the opportunities so offered to build subways for tramway or railway purposes, perhaps even for ordinary vehicular traffic, in the manner proposed by the London County Council along the new street now being made from the Strand to Holborn."

New Patents.

These patents are open to opposition until May 12th.

1901.—Blocks for Flat Arches.—4,437. W. W. WILSON, 140, Richmond Road, Crewe. The blocks are made with an internal wedge-shaped key at each side, fitting into corresponding recesses in the adjacent blocks.

Tiles.—6,350. R. STANLEY, Manor Court, Nuneston. Oil or other lubricant is automatically distributed over the inner walls of the die and also, if needed, on the faces of the plungers. The result is that the tiles are harder, especially on the arrises, and the faces and backs are made very smooth and polished.

Gravel Washing Machines.—6,863. S. J. & S. A. PEGG, both of Alexander Street, Leicester. The trough of the machine (in which the material is placed) is made in sections which can be removed at will, so that one that is worn can be renewed without interfering with the rest. A further improvement consists in making the legs adjustable as regards height, so that the trough may be placed at the proper angle to drain off the water whatever the level of the ground may be.

1902.—Wells and Shafts.—505. L. MONNOYER, 262, Avenue Louise, Brussels. The lining is shaped like a truncated cone instead of being cylindrical, and the space between it and the surrounding earth is filled with fragments of stone, by which means the construction of the lining can be commenced from the beginning of the sinking operations. In proportion as the sinking is continued the portion built descends by its own weight. The lining is seated on a timber base furnished with a cutting shoe.

Pipe Cutters.—1,681. G. MITCHELL, Naco, Co. Cochise, Arizona, U.S.A. The device consists of a sectional ring having three threaded rods passing through it with cutting wheels at their inside ends. The ring is made in two parts, which are drawn together as required by a clamp.

The following specifications were published on Thursday last, and are open to opposition until May 19th. A summary of the more important of them will be given next week. The names in italics are those of the communicators of the invention.

1901.—2,873. BROWN, street gas lighting. 3,048, NORRIS, rotary cutting tool for wood or similar material and method of shouldering door stiles. 5,374, BRIGGS, composition of mica and bitumen or pitch. 5,767, BARBALET, automatic gas and water valve for geysers. 5,834, KILLON, apparatus for the automatic discharge of sewage.

5,922, BURNEY, manhole doors. 6,623, ISSERLISS, lime and cement kilns. 6,800, BUTCHARD, BUTCHARD, BUTCHARD & GIBSON, manufacture of cement. 8,522, ROBERTS, operating the ventilators of greenhouses. 8,556, WEBER, imitation stone. 8,774, KENDALL, window sashes and frames. 9,675, JANDUS ARC LAMP & ELECTRIC CO., LTD., & JONES, arc lamps. 10,857, CLARK (*Füller & Ziegler*), manufacture of cement. 18,637, BREAKELL, grinding and pulverising mill. 25,239, HEAP & ODDY, manufacture of Portland slag cement and hydraulic lime.

1902.—658, EDWARDS, securing tiles to stoves, kitcheners, bath frames, &c. 728, INGHAM & LANGTON, bottom for Hoffmann kiln. 2,396, ADAMS, closets. 2,574, MOYLE & WARNER, tile floors. 2,603, JACKSON & JACKSON, hot-water or steam radiators. 2,927, DIXON, low-pressure heating apparatus.

Masters and Men.

The Kidderminster Operative Bricklayers have struck work for an advance of a penny an hour in their wages, so as to raise them from 8d. to 9d., and in addition they asked for an alteration of some of the working rules in the trade. A large number of labourers are affected. Representatives of the masters and men have had a conference, at which the latter expressed their willingness to resume work at halfpenny an hour advance instead of the penny they at first asked. The employers declined to give any advance, but offered the men arbitration on the points in the dispute, which was refused by the men.

The Bricklaying Question.—Mr. Stewart's statements respecting bricklaying in America (*see p. 67 of our issue for March 19th*) have been disputed by Mr. J. Oldham, an English bricklayer of twenty-five years' standing who has worked extensively in America and has been a delegate for a branch of the International Union of bricklayers of America. He says in the "Times": "Although their bricks are much lighter and smaller than ours, my experience is that nothing like the quantity stated by Mr. Stewart is ever even thought of there. Their bricks are 8in. by 4in. by 2 $\frac{1}{2}$ in., taking 1,170 to measure what 880 English ones do; so in a day's work given by Mr. Stewart 2,340 would be equal to 1,760 of ours. In working in America for what are called 'front lumpers,' and who pay a dollar a day more than the trade-union rate of wages, every satisfaction is given when 500 to 700 bricks are set, according to the class of work. I have worked on tenements (their lowest class of work), the average on these being less than 2,000 a day, the quality of work not bearing comparison with English." Mr. Oldham says in conclusion that New York has been built by Englishmen, and the most successful contractors in the class of work where it is possible for the largest number of bricks to be laid are Englishmen.

The Birmingham Dispute Settled.—An arrangement has been arrived at between the Management Committee of the Operatives and the Master-Builders' Association which finally settles the whole of the difficulties in the trade in Birmingham and the Midland Counties. The employers were anxious to reduce the wages from 9 $\frac{1}{4}$ d. per hour to 9d., but it has been decided that the wages will remain as before. The time for commencing work in the morning remains as before. In regard to overtime, hitherto the operatives have been paid time and a quarter from half-past five till six o'clock, and then time and a half. It has been arranged, however, that the men shall work from five o'clock until six without extra overtime payment, and that after six o'clock they shall be paid at the rate of time and a half. The men have also agreed to only take half an hour for dinner instead of one hour during the winter when engaged on outdoor work; but in the workshops the hour for dinner will still be conceded. In future only two hours' notice will be required on either side for the termination of an engagement, instead of 2 $\frac{1}{2}$ hours as formerly. The notice is to be handed in at the close of the day. It has been agreed to submit in future all differences to a mutual reference rather than have the trade dislocated.

At least, no stoppage of work has to take place under any circumstances in future until the matter in dispute has been brought before a sub-committee or a special arbitration board. It is now claimed that the employers and employed in the building trade in Birmingham are on a better footing to-day than in any other district in the Kingdom.

Labour in the Colonies.—The April Circulars of the Emigrants' Information Office, of 31, Broadway, Westminster, S.W., show the present prospects of emigration. This is the best season of the year for emigrants to go to Canada. There is a good demand for men in the iron and steel works at Sydney (Cape Breton), Hamilton, Sault St. Marie, and elsewhere; and some demand throughout Canada during spring and summer for carpenters, painters, masons and others in the building trades. In New South Wales the building trade is not so brisk as it was, and less wages are being accepted. The engineering trade continues good, with full rates of pay. The wharf labourers are agitating for a rise in their wages to 1s. 3d. instead of 1s. an hour. In Victoria there is no general demand for more labour, but a competent mechanic has not much difficulty in finding work. The various boards appointed under the Factories Act have fixed the minimum wages for labourers in the pottery trade at 36s. to 40s. per week of forty-eight hours, and for females over eighteen years of age employed in the making of general pottery at 20s. In South Australia considerable numbers of mechanics and labourers, more especially those in the engineering trades, have been out of work at Gawler; and at Port Augusta men have been thrown out of employment by the closing down of the smelters. There is practically no demand for more mechanics in other towns, but a skilled hand such as a mason, bricklayer, engine fitter, blacksmith, joiner or carpenter can generally find employment after looking about for a little. Reports received at the Government Labour Bureau in Western Australia at the end of last year show that there was a good demand for men at Perth, especially for those in the building trades; that there was no demand at Fremantle, Geraldton, Collie or Busselton; that there were many unemployed at Coolgardie, Kalgoorlie, Kanowna and neighbouring goldfields; that at Northam there was a very good demand for mechanics and unskilled labourers. In Tasmania, mechanics at Zeeham, Queenstown and Gormanston, on the west coast, and in the surrounding districts, are well employed; good fitters can generally get work without difficulty. In other parts of the State there is no general demand for more mechanics, but there is an opening for them if they have a little money. In New Zealand the building trades have been busy generally, especially at Auckland, Gisborne, Napier, New Plymouth, Westport, Christchurch and Invercargill; but at Dunedin many men are out of work. The engineering trade is fairly well employed, especially at Westport and Timaru, but at Dunedin many are unemployed. In South Africa, both in Cape Colony and Natal, there is a good demand for skilled mechanics, especially those in the building trades, if they have a little money to live on at first, but no one is now allowed to land in South Africa without a permit. This must be applied for at the Permit Office, 47, Victoria Street, London, S.W. The applicant must possess £100 or prove that he is in a position to maintain himself in South Africa. Applicants living within fifty miles of London must apply in person. These permits are no guarantee that the holders will be allowed to proceed inland.

The Will of Mr. Edward Oslow Ford, R.A., has been proved by Mr. Matthew Ridley Corbet, A.R.A., and Mr. Wolfram Oslow Ford, the son, the value of the estate amounting to £10,720.

The Iron and Steel Institute will hold its annual meeting at the Institution of Civil Engineers, Great George Street, Westminster, on Wednesday and Thursday, May 7th and 8th next, commencing each day at 10.30 a.m. The Bessemer Gold Medal for 1902 will be presented to His Excellency F. A. Krupp, of Essen, and many interesting papers will be read and discussed. The annual dinner will be held on the Wednesday in the Grand Hall of the Hotel Cecil.

Keystones.

Mr. Henry Rose, architect, of Chard, died recently. He was for twenty-five years a member of the Architectural Association.

A **Coronation Memorial** at Hertford is proposed to be erected. It will consist of classrooms in connection with the local Public Library and School of Art. The estimated cost is £1,250.

A New Edition of "**Hortus Inclusus**"—letters written by John Ruskin to the Misses Beever, Coniston—is to be published this month by Mr. George Allen, price 6s. nett.

A New Infirmary at Highfield, Knotty Ash, is to be erected. Messrs. Jones & Sons, Pleasant Street, Liverpool, are the contractors, the estimated cost being £74,650. The architect is Mr. Edgar Kirby.

The Estate of the late **Mr. Bentley**, architect of the new Roman Catholic Cathedral at Westminster, has been valued at £5,961 13s. 9d. gross, and £4,052 17s. 9d. nett. Mr. Bentley named no executor, but appointed his wife as universal legatee.

In **St. Clement Danes Church**, Strand, W.C., a series of five stained-glass windows have been erected. One of these—that on the north-east corner—is a memorial to Dr. Johnson, who worshipped in a gallery seat close by for many years. Messrs. Curtiss, of Soho, designed the series.

A New Hall at Port Erin for public meetings, social gatherings, concerts, &c., is being erected at the rear of St. Catherine's Church. It is being built of local stone, with limestone dressings from Scarlett. In the main building there will be seating accommodation for about 240 persons. Messrs. William Coslain & Son are the masons, and Mr. Henry Clague is the joiner. Mr. Armitage Rigby is the architect.

Bristol Cathedral Sedilia.—The Dean and Chapter of Bristol Cathedral have given the order for the restoration of the sedilia, sufficient funds having been received to justify their restoring them in part. A further sum of £300 is still needed to complete the cost of the restoration. The work will be forthwith undertaken by Mr. Hitch, of London, to whom the beautiful reredos was entrusted.

The Monument to **Charles Garnier**, the architect of the Paris Opéra, is in course of erection in front of the façade in the Rue Auber, Paris. M. Van den Sande, the sculptor who co-operated with Garnier in the construction of the Paris National Opera, has just died in the French capital. His last days brought him great trouble, domestic affliction, pecuniary difficulties and ill-health, making his life extremely miserable. So meagre was his studio furniture that, on being sold for debt, it realised only 60fr.

An Addition to the **Banffshire Lunatic Asylum** buildings at Ladysbridge, Banff, in the shape of a new block for the accommodation of male patients, is being erected. A new boiler-house is also being built for the asylum. Messrs. W. & J. Smith & Kelly, Union Street, Aberdeen, are the architects for the new block. The contractors are:—Mason, Mr. David Forsyth, Elgin; carpenter, Mr. James Day, Botriphnie; plasterers, Messrs. Sellar & Co., Aberdeen; plumber, Mr. H. J. Watson, Banff; slater, Mr. John Hutcheson, Banff; glaziers, Messrs. Charles Innes & Co., Banff; smithwork, Mr. Thomas Paton; heating engineers, Messrs. Mackenzie & Moncur, Ltd., Edinburgh.

Business Offices for the Barton Regis Guardians and an office for the registration of births, marriages and deaths have been opened adjoining the workhouse, Southmead, Westbury-on-Trym. It was not until 1847 that the workhouse and offices (that have done duty for fifty-five years) were first used at Eastville. The extension of the city boundaries made it desirable for the Guardians to provide a new workhouse. The main building is being erected at Southmead by the contractor, Mr. H. A. Forse. The cost of the site was £3,700, and the outlay for the new building, furnishing and machinery will amount to £29,000. The buildings are divided into five main blocks, and the architects—Mr. A. P. I. Cotterell, A.M.I.C.E., Bristol, and Mr. W. H. Thorpe, F.R.I.B.A., of Leeds—have adopted the style of English Renaissance.

Richmond Hill View.—The Twickenham District Council have decided to increase their contribution towards the purchase of the Marble Hill Estate from £3,000 to £6,000.

An **Art Museum** is proposed to be erected in Aberdeen in connection with the Art Gallery. The museum, it is intended, will contain casts of the finest examples of Greek, Italian and other art, and is expected to prove important and useful to the granite industry of the district.

A New Wesleyan Church at Wallsend has been erected at the corner of Laburnum Avenue and High Street. Mr. McHarg was the contractor, and Mr. J. Walton Taylor, of Newcastle, the architect. It accommodates 800 persons. The cost was about £6,500.

The **French School in Athens**.—A new branch of the French School of Archaeology, destined for the reception of students of other nations which have no separate institution at Athens, has been opened. The new addition to the French school will confer great advantages on students of art and archaeology, who come to Athens in increasing numbers, and will enhance the already great reputation of this celebrated institution.

Mr. David Howorth, architect and surveyor, of D. Howorth & Son, Lord Street, Liverpool, died recently at the age of seventy-seven. Mr. Howorth had not of late taken any active part in the business, which has been carried on by his son, Mr. F. A. Howorth. Mr. Howorth commenced to practice in Liverpool in the early 'fifties, and was widely known in the building trade, especially as a quantity surveyor, in which capacity he enjoyed a high reputation.

New House, South Hill, Bromley, Kent.—This house is now being built, and the outside finished with rough-cast, the roofs being covered with tiles and the chimney stacks built faced with red bricks. The hall and staircase is panelled out 7ft. 3in. high, with oak staircase and floor. The glazing throughout is leaded, except the lower lights to the living- and dining-rooms, and the house is fitted with heating pipes and electric light. Mr. Edgar H. Selby, 8, Buckingham Street, Adelphi, W.C., is the architect, and the general contract is being carried out by Mr. F. P. Duthoit, builder, of Bromley.

Solicitors' Offices at Worthing. — Premises No. 26, Chapel Road have recently been erected for Messrs. Bennett & Marsh. The front is faced with red bricks with gauged window sills and stone sills. The roofs are covered with Westmoreland slates, and the glazing is leaded. At the back of the premises are the house-keeper's rooms, which, however, communicate with the ground floor and also with the half-landing of the office staircase. A strong-room is provided on the ground floor, and the offices are fitted with the electric light. The architect is Mr. Edgar H. Selby, of 8, Buckingham Street, Adelphi, W.C.; Messrs. Snewin & Son, of Worthing, were the builders.

The **New Palace of the Swiss Parliament** at Berne was opened last week by the members of the Swiss Federal Council and the Federal Assembly. The new Palace was sanctioned in 1892, and begun in 1894. The buildings, which have cost eight million francs, were designed by Professor Auer, of St. Gall, under whose direction they were carried out. In conformity with the recommendation of the Legislature, none but Swiss artists and Swiss material were employed in the embellishment of the building. The new Palace, which is surmounted by a lofty cupola, is placed between the two Government Palaces, and the whole now constitutes one building.

The **House of Mr. Alfred Gilbert**, R.A., in Maida Vale, W., which has been sold, was not, as has been stated, designed by Mr. Gilbert himself. He merely stated his requirements and made his suggestions; but the architect was Mr. Howard Ince, whose design was exhibited at the Academy in 1893. In the original design was included not only the series of studios and the house as built and intended for the residence of Mr. Gilbert's father, but also a larger house for Mr. Gilbert's own use. This the architect placed on the eastern side of the site, the billiard- and music-rooms being common to both. But the carrying out of the entire scheme was found too expensive, and is now left to the enterprise of the new tenant, whoever he may be.

The late **Mr. W. W. Williams**, architect, of Swansea, was buried last week.

Change of Address.—Mr. A. E. Mullins, architect and surveyor, has removed his offices from 16, Church Street, Camberwell Green, to 48, Peckham Road, S.E., nearly opposite Camberwell Town Hall.

The **New Town Hall** at Colchester is to be opened by Lord Rosebery, and he will be presented with a key and a casket. Views of the municipal pile will be worked into the design of the casket.

Mr. H. H. Collins, F.R.I.B.A., F.S.I., has been unanimously elected to the chairmanship of the Public Health Department of the Paddington Borough Council, in succession to the late Sir George Harris.

Additions and Alterations at Windsor Station are being made to the Royal waiting-room by the Great Western Railway. The extension, which, like the original building, is constructed of Bath stone and granite, is 40ft. long. The additional space thus gained enables separate apartments to be provided for the King and Queen when using the terminus.

New Race Club and Grand Stands at Manchester have been erected on the new course at Broughton. The whole of the buildings are in the Early Renaissance style, the lower portion of the ground floor being faced with red stock bricks, with stone dressings to the doors and windows. The timber-work of the upper portion of the building is ornamented.

A **New Parish Hall** at Dover has been erected in St. James Street from designs by Mr. Beresford Pite, F.R.I.B.A. Messrs. Brisley were the builders. The section in the rear, with a frontage to Russell Place, still remains to be completed. The St. James Street frontage has an entrance in the centre, under a semicircular arch, with bay windows on either side.

Manchester City Architect.—Mr. Henry Price, chief of the Architectural Department and Surveyor of Buildings to the Birmingham Corporation, has been recommended by the Town Hall Committee for appointment by the Manchester City Council to the newly-created office of City Architect. Mr. Price has been five years in Birmingham, and was prior to that chief assistant to the Building Surveyor at Liverpool. There were thirty-nine applicants for the Manchester appointment.

A **New Hall** at Aberdeen has been erected for the **Enzie United Free Church**. The frontage of the hall is to Main Street, and is Gothic in style, the walls being rock-faced ashlar. It is 51ft. by 31ft., and seats 300 persons. The contractors were:—Builder, Mr. Legge, Fochabers; joiners, Messrs. Hendry Brothers, Portgordon; plasterer, Mr. R. Reid, Portgordon; slater, Mr. Barclay, Buckie; painter and glazier, Mr. Macdonald, Portsoy; and plumber, Mr. Campbell, Buckie. The architects were Messrs. D. & J. R. Macmillan, Aberdeen.

George's Dock Site, Liverpool.—It has been decided that the site of the former George's Dock remaining unallotted after the extension of Water Street, Brunswick Street and James Street, the erection of the new head offices of the Mersey Docks and Harbour Board, and the new Pierhead Baths, shall be strictly reserved for buildings in character with the docks offices and the baths. Various schemes, including an arcade and shops, have been rejected in favour of a policy confining the residue of the site to offices and kindred buildings.

The **Curious Octagonal Hall** at Godalming, which stands at the junction of High Street and the Portsmouth Road, which has been so long threatened with destruction, has been saved by an offer of Mr. Thackeray Turner, of the Society for the Preservation of Ancient Buildings. A petition appealing to the town council to allow the building to remain as a specimen of a market hall erected when George III. was king was recently signed by Prince Christian, Princess Louise, Prince Albert of Schleswig-Holstein, several eminent R.A.'s, and other well-known people, and this has influenced the local authority. Mr. Thackeray Turner has been granted a seven years' lease of the building, which it is hoped to utilise as a reading-room, the council reserving the right of using it for proclamations and similar ceremonies.

COMING EVENTS.

Wednesday, April 9.

SANITARY INSTITUTE.—Dr. Patrick Manson on "Prevention of Malaria" (Lectures and Demonstrations for Sanitary Officers: Part I.).—Mr. J. E. Worth, M.I.C.E., on "Scavenging, Disposal of House Refuse," 7 p.m. Inspection and Demonstration in the District of Islington, and at the Borough Disinfecting Station at 2 p.m., conducted by Mr. James R. Leggett.

INSTITUTE OF SANITARY ENGINEERS, LTD.—Meetings of Examination and Literary Committee at 3.30 p.m., of General Purposes and Finance Committee at 4 p.m., Election Committee at 5.15 p.m., and Sessional Meeting at 7 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students Visit to the Works of Messrs. Doulton & Co., Ltd., High Street, Lambeth, S.E.

Thursday, April 10.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

ROYAL INSTITUTION.—Prof. Dewar on "The Oxygen Group of Elements,"—I., 3 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Discussion, Messrs. Swinburne & Cooper's paper on "Problems of Electric Railways," 8 p.m.

Friday, April 11.

ARCHITECTURAL ASSOCIATION.—Special General Meeting to consider alterations and additions to by-laws. Mr. W. D. Carie on "The Preservation of Ancient Buildings," 7.30 p.m.

PHYSICAL SOCIETY.—1. Mr. Grant, "An Apparatus for Vapour-pressure Measurements." 2. Mr. Morris, "The use of Cathode Rays for Alternating-Current Measurements." 3. Mr. Morris, "An Experiment on the Current Growth in an Inductive Circuit." 4. Dr. R. A. Lehfeldt, "An Electric Heater." 5. Mr. S. A. F. White, "Note on the Compound Pendulum," 5 p.m.

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. James I. Little on "The Sewage Disposal of a Country House," 8 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Annual Meeting.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Mr. W. Hunting on "Health and Disease in Animals destined for Food," 7 p.m.

ROYAL INSTITUTION.—Prof. Dewar on "Problems of the Atmosphere," 9 p.m.

Saturday, April 12.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Inspection and Demonstration at the Sewage and Destructor Works, Baling, at 2.15 p.m., conducted by Mr. Charles Jones, M.I.C.E.

ARCHITECTURAL ASSOCIATION.—Fifth Spring Visit to the Eastern Telegraph Company's Offices, Finsbury Pavement, by permission of the architect Mr. John Belcher, A.R.A., 2.30 p.m.

Monday, April 14.

SURVEYORS' INSTITUTION.—Mr. O. H. Hooper on "Compensation for Fruit Planting," 8 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Mr. W. Hunting on "The Organs of the Body in Animals," 7 p.m.

BRISTOL SOCIETY OF ARCHITECTS.—Annual General Meeting. Election of Council and Officers. Mr. J. Awdood Slater on "A Continental Tour," 8 p.m.

Tuesday, April 15.

NATIONAL REGISTRATION OF PLUMBERS (DISTRICT COUNCIL FOR CARDIFF, SOUTH WALES AND MONMOUTHSHIRE).—Paper by Mr. Edwin Seward, F.R.I.B.A., at 8 p.m.

ROYAL INSTITUTION.—Dr. Allan Macfadyen on "Biological Enquiry"—I., 3 p.m.

Wednesday, April 16.

BRITISH ARCHEOLOGICAL ASSOCIATION.—Meeting at 1.30 p.m.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Mr. W. Hunting on "Practical Methods of Stalling and Slaughtering Animals," 7 p.m. Inspection at Demonstration at Knacker Yard.

SOCIETY OF ARTS.—Mr. J. Bridges Lee, M.A., on "Photography as applied to Architectural Measurement and Surveying," 8 p.m.

Thursday, April 17.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Annual Dinner at the Hotel Cecil.

SOCIETY OF ARTS (Indian Section).—Mr. Sidney Preston, A.M.I.C.E., on "Recent Developments in Punjab Irrigation," 4.30 p.m.

Friday, April 18.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. A. Needham Wilson on "A Tour through the South of France," 7.30 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting, at 8 p.m.

VIRING CLUB. Thomas Street, Grosvenor Square, W.—Mr. A. W. Johnston, F.S.A., Scot., on "The Earl's House and Round Church of Orpington, Orkney," 8.30 p.m.

ROYAL INSTITUTION.—Sir John H. A. Macdonald on "The Auto-Car," 9 p.m.

SANITARY INSTITUTE (Lectures and Demonstrations for Sanitary Officers: Part II.).—Mr. James King on "Disinfecting Meat," 7 p.m.

Saturday, April 19.

SANITARY INSTITUTE.—Inspection and Demonstration for Sanitary Officers at Morden Hall Dairy Farm, Morden, Surrey, at 3 p.m., conducted by Mr. Oscar J. White.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Traquair House and the Town of Innerleithen.

Surveying and Sanitary Notes.

Society of Ordained Surveyors.—The report of the Council for the session 1901-2 states that the Society is in a flourishing condition. The funds at the close of the financial year amounted to £245 11s. 7d. Four candidates have come forward for the preliminary examination to be held this month and one for re-examination, while five candidates have presented themselves for the final examination (one each from Edinburgh, Inverness, Perth, Kirkcaldy and Dumfries). Mr. Forrest H. Lightbody is the hon. secretary (56, Queen Street, Edinburgh).

OUR INSURANCE SCHEMES

offer advantages of which every Reader should avail himself.

These are the Schemes:—

(1) *A Free Accident Insurance of £500 to every regular reader of our paper.*

(2) *An Accident Insurance of £500, and also £250 for Permanent Total Disablement. £2 10s. per week for Temporary Total Disablement.*

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

(3) *An Accident Insurance of £1,000, with the following special additional advantages: £500 for Permanent Total Disablement. £6 per week for Temporary Total Disablement. £1 10s. per week for Temporary Partial Disablement. £30 Annuity. £3 per week during confinement from such illnesses as Small-Pox, Diabetes, Scarlet Fever, Carbuncle, &c., &c.*

Ordinary Risks, Premium, £3/-
Hazardous Risks, Premium, £3/10/-
Write for Proposal Form.

These Insurances are guaranteed by the Ocean Accident and Guarantee Corporation, Limited.

SPECIAL NOTICE.

(1) It is not necessary to subscribe direct to the office in order to secure the benefits of the above schemes.

(2) Even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3) It is sufficient for us to have an intimation from the newsagent that he supplies copies regularly.

(4) Policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5) In applying it is only necessary to write a postcard, giving the full name and address of the newsagent from whom the copy is obtained.

A Pamphlet, giving full details of the THREE SCHEMES will be sent on application to

THE MANAGER, BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

An Architectural Causerie.

Nest Architecture. THE birds have now built their nests and they have done so in the same way as when man lived in caves, and before he had the intelligence to build for himself. A bird's nest offers the most interesting problem, for while some call it architecture, others (including Viollet-le-Duc) call it construction, though one of the strictest tenets of the modern critic is that architecture is good construction, in contradistinction to the definition that it is the art of building according to principles of beauty and harmony in addition to those of pure utility. However, this quibble of words never results in anything definite and consequently it is useless to continue the wrangle. It is both well and opportune, however, to consider the construction of nests with the view, not of acquiring any new principles, but of appreciating the wonderful intelligence they display. Some are comparatively coarse, like the rook's which sways to and fro on the branches of an elm, while others, like the titmouse's, are a microcosm of care and dexterity: some are hollowed out in living trees, some are dome-covered (like the wren's), some clay-built, some swung hammock-wise, some suspended by a single cord, and some stuck together with a secretive resembling glue. In each case there is an example of construction worthy of our attention, and while the reasons for most of the features are at once obvious, there are others which are only discovered after a close examination; such, for example, as the counterpoise of earth which is added to balance the increasing weight of the growing young birds, which, in their time, through inherited habit and imitation, will build as their parents did. As Ruskin says: "It cannot be imagined that either the back streets of our manufacturing towns, or the designs of our suburban villas, are things which the angels desire to look into; but we should at least possess as much unconscious art as the lower brutes, and build nests which shall be, for ourselves, entirely convenient, and which may perhaps in the eyes of superior beings appear more beautiful than to our own."

Streets of the Future. It is estimated that London has nearly two thousand miles of streets: Islington alone has 120 miles, while Lambeth includes 140 miles of streets; and the task is to keep them clean. In

most districts horse-brooms, water-carts and gangs of scavengers are turned out in the early hours of the morning to remove the dirt, and it is only the City that really washes down its streets with a hose pipe; but there can be no doubt that the latter is the better method. It has been stated that the cost of washing Oxford Street by water-vans is 9d. per 100 yds. super. and that of washing the Strand by hose 3½d.,

as a living thing, now adds to our streets, yet the insanitary condition into which he reduces them will be done away with when all traffic is carried on by automobiles; and one of the primary requirements of a city is that it shall be as thoroughly sanitary as possible. Moreover, there is the financial side of the question. At present the wear and tear in streets is almost entirely due to the pounding of horses' hoofs,

DAIRY AND FLATS, GREAT MARYLEBONE STREET, LONDON, W.
SAUL AND HARDY, ARCHITECTS.

though considerably more water was used by the hose. In neither of these streets, however, is there any asphalt, and the difference between their condition and that of the City streets is very great. Asphalt is indeed the material of which all the streets of the future will be made, for it provides the ideal surface for motor-cars, and nobody observant of the times can fail to see that these must inevitably supersede the horse in cities. Nothing is an unmixed blessing, and though we shall lose the charm which the horse,

which so breaks up the surface that the sewers are charged with wood fibre which decomposes very slowly and is extremely difficult to get rid of; so that when the pleasant motor-car arrives—not the crude, undeveloped, nerve-racking creation of the present, but the perfected, quiet, non-smelling motor-car of the future—the authorities will be free of the great expense of keeping their streets in repair and of maintaining a huge body of men and machines for cleansing them.

RECENT STREET ARCHITECTURE IN LONDON.—II.

BY F. HERBERT MANSFORD.

(Continued from p. 3, No. 367.)

SINCE Inigo Jones erected an Italian arcaded piazza in Covent Garden, London has been adorned and marred by other architectural importations. We have an American skyscraper at Queen Anne's Gate, Continental hotels in Northumberland Avenue, and the covered side pavements of Australia at Brixton. Now we witness an attempt to introduce the principle of the Chester "Rows" into Shaftesbury Avenue. A large triangular block has been completed at the north end with a row of shops on the first floor sufficiently set back to permit a covered terrace or pavement to be provided in front, approached by stairs at convenient points. It will be remembered that Sir Frederick Bramwell advocated this arrangement for the Holborn to Strand street; its failure here on an isolated block would not necessarily prove its ineptitude if carried out in a series. The choice of materials for this interesting experiment was not a happy one. Stout granite columns bearing exposed iron girders would have been more satisfying to the eye than the existing terra-cotta casings to slender iron stanchions and joists. But it is not, perhaps, reasonable to suggest a less fireproof construction. Above are a series of flats, presumably by the same designer as others in Cavendish Square and St. James's Street. The same hardness of detail and partiality for battlements and meagre Tudor chimneys characterises both. The sheltered terrace forms a promenade for the occupants of the flats, so that the shopkeepers will not depend entirely upon the willingness of the general public to mount flights of stairs, and the children will have a dry walk in all weathers.

Messrs. Novello & Co.'s printing premises in Hollen Street, Wardour Street, form a substantial block of red brick, relieved by two carved friezes. The sculptor has courageously introduced a modern printing-press among the naked amorini with a success that makes one regret the narrowness of the thoroughfare, which precludes proper examination.

Tall chimney construction is an entirely modern architectural development, although, perhaps, one should scarcely say "architectural," for these stalks are frequently outside the architect's domain, as witness that of the Electric Power Station at Chiswick, which consists of 260ft. of metal tubing standing on end. Tall chimneys are becoming common features of our streets, and of late they have increased more rapidly than church towers and spires. If the architect who has the chance of designing one is free from Classic or Mediaeval precedent he is, however, closely bound by the London Building Act, which, while nominally only limiting the thickness of walls and fireproof lining, determines very nearly the outline itself. That is to say, given the size of aperture at the top (dictated by boiler-makers) and the thickness of walling, very little variation of outline can be made without extravagance of material. "Mangia," the tower of the municipal palace at Siena, has been taken as a model for more than one tall London chimney; the East London Water Company have erected several chimneys of another campanile type, but recently the octagonal plan has found favour, and this seems to have rendered Italian models less persistent in the minds of the designers. The tall chimneys which have been built north of Golden Square give an interest to the rather squalid streets which they dominate. They have a worthy rival in the square stalk by St. Anselm's Church, Davies Street (illustrated on the opposite page).

PAGANI'S RESTAURANT, GREAT PORTLAND STREET, W.
PROFESSOR BERESFORD PITE, ARCHITECT.

DETAIL OF PAGANI'S RESTAURANT.

In Oxford Street the most recent buildings are commonplace, but expectancy of something better naturally arises in connection with the clearance for Messrs. Waring & Co.'s new premises opposite the Pantheon. The timber staging is certainly one of the most pleasing examples of the current taste for decorative hoardings and scaffolds.

A considerable amount of rebuilding is taking place in the neighbourhood of the Middlesex Hospital, tenement houses giving place to flats. A few of these display more or less successful experiments in the combined use of bricks and cements of various colours. In Langham Street is a nursing home faced entirely with white and black glazed bricks, but salt-glazed or blue Staffordshires are chiefly employed for the lower storeys and red or yellow facings above, with coloured cement panels, stonework being confined to the doorways and copings.

Italian restaurants in London frequently attempt some reminiscence of the South, generally through the medium of paint. Some years ago a pleasing terra-cotta façade near Tottenham Circus, on coming into possession of Italian restaurateurs, was coloured to imitate marbles. Pagani, however, in Great Portland Street, have set a better example. A dull-glazed faience façade was erected about two years ago, and quite recently Professor Beresford Pite has extended the treatment and also spread a veneer of tile mosaic over the upper portion of the premises, capping it with a deep-coved eaves and slate roof. The strangeness of the work may provoke disapproval at first, but a growing acquaintance will probably arouse a less biased judgment and qualified approbation. It is necessary to bear in mind that it is of two dates and by two designers. The colours of the faience are pleasing; the modelled insertions of Pomona, Ceres, &c., have not the garishness usually associated with Della Robbia ware and which might be out of place in London. The details of the niches between the first-floor arches show

the refinement we expect from Professor Pite and satisfy the eye even while empty. But the freedom of the mosaic above, the swirl of it, the partial disregard of the architectural lines of the windows, may not equally commend themselves. Perhaps the architect himself regards the work as somewhat in the nature of an experiment. However, Great Portland Street has been enlivened by something expressive and original, and one feels grateful.

On the west side of Princes Street, Cavendish Square, is an interesting example of close union between sculptor and architect. The two bays which form the principal features of the elevation are upheld by crouching figures. The modelling is scarcely equal to the design, lacking somewhat in fullness and strength, but the general effect is pleasing.

On the Portland estate the end house of a row generally had stabling attached with a frontage to the side street. In several cases these stables have given place to houses of varied design, but governed by the general condition of respect for ancient lights. As a result, the vistas of the streets west of Portland Place are now enlivened by low red-brick houses with tiled or green-slatted roofs.

In Great Marylebone Street some new dairy premises have afforded the architects a favourable opportunity for design. Favourable, because a dairy does not demand an excessive display of plate glass and because the new façade terminates the vista southwards of Westmoreland Street. Messrs. Saul & Hardy have availed themselves to the full of these advantages and produced an elevation appropriate and distinctive. A pleasing shop-front is enclosed by a wide three-centred arch with a projecting stone hood. Above this are carved some poultry, slightly modelled, but thrown into strong relief by the deep sinking of the ground, an effect being produced analogous to that of fretwork. Above, the six bay windows of the flats are reposeful by their similarity and by the amount of undisturbed wall-surface on either side. The cornice is bold and effective, and in the gable above we see that a semicircular-headed window can be satisfactorily divided by a single mullion if the line of it is led up to or continued by the treatment of the wall-surface. It is understood that the premises on either side will shortly be rebuilt and that the architects will accept Messrs. Saul & Hardy's design as a centre and carry on a harmonious treatment to the right and left.

Near by, in the High Street, Marylebone, some butcher's premises are rendered attractive both by excellences of detail and by careful selection and juxtaposition of the materials employed—Norwegian felspar, unpolished grey granite, purple and bright red bricks.

In the Marylebone Road is Harley House, a block of flats designed on an ampler scale and in a more generous manner than usual. The old trees have been preserved and a carriage-drive formed on the 50ft. of land which still survives in front of most of the houses in this thoroughfare. The two principal elevations are faced with stone; and although the heights of different portions vary considerably the whole structure is well knit together by a continuous cornice and its surmounting railing. The angle pavilion has a steep eight-sided roof crowned with a pleasing termination in copper.

There is little recent street architecture of interest in the districts of St. John's Wood and Maida Vale. A block of flats by Professor Pite opposite the burial ground in Paddington Street, the extension of the Christian Union Almshouses in John Street, and a lofty-gabled house on the east side of the Edgware Road show freshness of detail. The neighbourhood of the Harrow Road is monotonous in the extreme, although the church towers and spires apprise the weary traveller of oases in the architectural desert.

(To be continued.)

An Old Font.—The rector of Caister-on-Sea has applied to the Chancellor of Norwich for permission to place in his church an ancient font recently discovered by the rector of Mellis in a cottage garden near Eye, Suffolk. The font is in Decorated style, and was probably fashioned in the sixteenth century. It had done duty as a big flower-pot, weighed nearly a ton, and was valued at £5. Where it came from originally has not been discovered.

STREET ARCHITECTURE.*

By BERESFORD PITE, F.R.I.B.A.

THE street architecture of England can only refer nowadays to the combined effect of the many various and unrelated buildings in our streets. We have no proper street architecture in the sense in which we may be said to have a domestic or ecclesiastical architecture of recognisable quality, possessing admitted characteristics born of tradition and new movement.

A broader description of civil architecture, including within the term buildings of municipal or semi-public character, will not alter materially our estimate or permit us to claim for our towns and cities an architecture of which we could in any general way define as coherent, traditional or worthily characteristic of our national taste and refinement.

CHIMNEY, DAVIES STREET, LONDON, W.

But our street architecture, such as it is, cannot help being representative of its producers and of their ideals or lack of them; and as there is neither lack of enterprise nor of self-esteem among us, particularly in the life of our street-building cities, the consideration of the external environments of this busy side of life may assist us in endeavouring to review the causes and effect of our lack of a street architecture which should rank with that of dwelling-houses and churches, and direct us to some ideals which may stimulate that desire for improvement which would ensue upon the consideration of a condition which we have been led to admit is unsatisfactory.

Comparison with Domestic and Ecclesiastical Architecture.

We have premised that our ecclesiastical and domestic architecture has life and artistic value,

* A paper read before the Applied Art Section of the Society of Arts on April 8th, 1902.

for any review of the art of the Victorian era exhibits a revival from mere formal symmetry and application of types to vital influences of artistic adaptation to purpose and pleasant reflection of the eclectic study of the traditional architecture of England. Education, culture, refinement and literary taste are evident in the whole movement of the building arts and crafts during this period. The churches of the latter half of the nineteenth century, arranged chronologically and illustrated internally and externally, will present a gallery of architectural designs of amazing versatility and originality, and of quite wonderful beauty of picturesque dignity and charm of detail rich in genuine beauty of workmanship and conception.

A similar result will be arrived at with the exercise of some greater selection in the earlier period by assembling an exhibition of English houses of all sizes, the homes indeed of the people of a profound peace and of unparalleled domestic prosperity and development. Stately or modest, romantic or homely, the same originality of conception, wide comfortableness, reasonableness and perception of the beauty of domestic life will be generally apparent, while in the details of decoration and furniture artistic impulse and architectural character have led to a real revival of the handicrafts which endeavours to make the commonest utensils of home life beautiful to eye and hand, ennobling alike the designer and the user.

It may be remarked incidentally that the manifested vitality of this English architecture has met with recognition at the hands of Continental critics, and that in ecclesiastical and domestic art we have an admitted mastery that has produced energetic followers and admirers in different directions.

It must be observed that the two branches of building art upon which we are touching have originated in one class of society, and in very many ways reflect its social conditions and ideals.

The same upper and upper-middle class have provided the examples alike of church and house building, and the movements of thought expressed in this architecture are of the refined education and literary taste—let us say—of those who have derived their ideal and sense of culture from university life and from opportunities of historical study. The breadth of view and freedom of thought, the criticism and eclecticism of the passing day are as present in its architecture as in its literature for all who can read the characters employed in their expression, of which an easy illustration can be offered in the sustained devotion to mediæval tradition both of the architect and of the ecclesiastic. In all the work of this representative class there is the characteristic of a powerful craving for a sense of style, a self-consciousness foreign to real Gothic art, but as current in the buildings as upon the lips of client and architect, and with this a strong personal note of individualism and independence which, by persistent differentiation both of example and type, has made the architect a man who seeks for originality without creative matter and for conformity to style without the opportunity of realising that environment of characteristics upon which completeness of artistic style depends.

The sense of refinement in this architecture has become so much a characteristic quality to be sought for, marked down and expressed, that native simplicity has been replaced by a laborious affectation which has danger in its artificiality, though its note of revolt against the tendency of the world at large to vulgar elaboration of effect is of great value.

Commercial Street Architecture.

As our subject is not the consideration of civil architecture, we exclude public buildings, although they form part of many street perspectives, and, with some reservations, cannot consider at any length the dwelling-house of the modern street—such streets of dwellings usually described as "parks" or "gardens," which might suffer in reputation by a more sincere classification—leaving for our discussion the buildings that compose the business quarters or centres of our cities, which may be safely defined as those of the commercial world—wholesale, retail, warehouse, store and shop, together with their necessary manufacturers', companies' and insurance offices, banks,

SHOPS AND FLATS, SHAFTESBURY AVENUE, LONDON.

and accommodation for the professional men who are essential to business life. It is, therefore, the business community which is mainly responsible for and indeed originates our street architecture, for whose wants it is designed and by whose ideals it is controlled. This commercial class is the backbone of our national life and prosperity, and upon it depends that measure of wealth without which architecture as at present practised could not exist. It has represented until now the pre-eminence of England, and we shall expect to discover in its architecture, if we have time for analysis and search, so much of this part of the secret of England's greatness as is capable of translation into stone and brickwork expression.

Comparing the architecture of the ecclesiastic and of the country gentleman with that of the business man, we would naturally anticipate finding that the predominating tastes of the one are sentimental and of the other practical or unsentimental. Art is so wholly a matter of sentiment—we might almost say it is pure sentiment of high and noble character, and architecture therefore largely, though not wholly, so—that we might, without surprise, discover that the street building of our commercial centres was entirely unsentimental, and architectural only in being wisely and designedly practical.

If we could plant an Utopia where, as a condition precedent of existence, subsistence was provided independently of the exercise or practice of art, we would devoutly wish the consummation that buildings only partaking of sentimental character should be designed by architects, and the streets devoted to unsentimental commercialism and its dependents, erected by mere surveyors. That they would be ideally beautiful architecture in so far as they were soundly built and truly adapted to purpose without the affectation of sentimental art I for my own part sincerely believe. The practical business man, however, takes the world as he finds it and conforms his labours to its requirements, and we, admiring the truly practical when it is practically true, must accept the street architecture of commercial purposes as it is, and suit our labours to its peculiarities.

The world, as observed by the keen eye of commerce, has a love of beauty—that is, of colour, of variety, of ornament. The Manchester print sells better in Africa if gorgeous, and ordinary articles of household use from smallest to greatest sell better if ornamented, just as they sell better if cheap; in fact, it is to be observed that cheaper articles can be obtained having more ornament upon them

than costly ones, cheapness and beauty of the commercial sort going hand in hand, and that which is intrinsically better being extrinsically worse, that it is deemed less worthy of decoration. The commercial world is at present so, its relation to true art anomalous and contradictory, but, we hope, yet under some preliminary pulsations of conscience upon the subject, at all events in the home market, though radically wrong in its conception of art as such. Art exists practically, and it is therefore grasped by the commercial hand, but its character changes in the touch from a pure sentiment to an advertisement, and in this very different aspect we meet it in our street architecture.

Good Design compatible with Requirements.

It may be well before going further to emphasise the necessary doctrine, that good building design—that is, good architecture—is not incompatible with the best adaptation to use, convenience and healthiness of arrangement. No definition of architecture should be allowed that would limit, in the presumed interests of art, for instance, all the access of light that business premises demand either in the size or position of windows. Should it be necessary to have the entire frontage of a building occupied with window surface, so far as the limit of the law allows, an architect would assume an entirely false standpoint should he declare that this purpose is contrary to art, though if he decides it necessary to limit the openings by constructive considerations he would be unquestionably within the sphere of his proper authority. Even architectural proportion—that subtle and almost indefinable quality of adjustment which gives pleasure—is itself based upon factors of service. For example, the apparently good proportions of a column depend upon a recognition of the substance of its material, for a well-proportioned wooden column would almost certainly become unsatisfactory if the same proportions were observed and it was erected of stone or brick. The traditional conventions of proportion in the so-called orders of classic architecture had their origin in the refined adaptation of supports to spaces owing to the necessary limitations of length and depth in the stone lintels which connected the columns. There is nothing radically inimical to satisfactory architectural proportion in any necessary acceptance of the large spaces requisite and recognised as essential for the window surfaces of shops or showrooms in warehouses upon the street fronts of the buildings.

The frank acceptance of the most serviceable and convenient materials for the peculiar requirements of commercial buildings is not under any circumstances to be avoided as inar-

tistic. In a public building of a quasi-monumental character and of varying use stone columns or arcades would have an architectural value and suggestiveness both in their forms and material. Association and tradition have in such cases much to borrow from ancient historic precedents, and a sheer modernism of idea would probably be alien in spirit to the *genius loci* and associations of the building. But in business architecture the converse is more usually the case; the commercial world can only in rare instances maintain ancient forms or style; the movement in trade of all kinds is to the newest and latest style, and the pressure of the time, not only in economy of production but in rapidity of distribution, is felt in every direction.

Use of Iron and Plate Glass Picturesque.

The employment of iron and steel fireproof construction for supports and lintels in the front as well as in the interior, the use of large sheets of plate glass and the carrying of great masses and weights upon narrow steel stanchions are instances of special treatment for which a pedantic architecture will not succeed in discovering conformable types in antiquity, though the same principles of truth, to which pedantry is blind, are to be observed if sought for in all genuine architectural forms. A progressive and living art of building has everything to gain from any new or increased suitability of its materials to the ultimate uses of the building.

We may depend that there is as much honest picturesqueness of true character about a modern warehouse front of rolled iron and plate glass as in the timber-framed construction and leaded-quarried glazings of its ancestor of the Elizabethan period, newly erected for the developing woollen trade of England, and similarly occupying whole surfaces of street frontage with small quarried glazed windows and a multiplicity of subdivisions necessitated by the overhanging construction—a contrivance to increase floor-space upon a limited site.

The advent of the employment of rolled-iron joists into building art, with its later development of complete steel-framed construction, marks an era upon the threshold only of which we now stand. The significance of this new aid to building can be estimated only by reference

LOGGIA TO SHOPS ON FIRST FLOOR.

to the truly astonishing high buildings of the United States. Nothing in architectural history can compare in importance with this development since the re-discovery and application of the dome to buildings of magnitude by Brunelleschi and Michael Angelo at the Renaissance. That sudden and amazing stride into a new domain of construction, when building art appeared to have exhausted its own development, is alike in extent and application to the almost spontaneous generation of high street buildings in America. The purposes and authors of the one class and of the other contrast picturesquely and characteristically enough, the evolution of conscious building art, cultivated by lofty ambition to do service to the universal ecclesiastical State policy of Christendom, on the one hand, and on the other the indomitable persistency of invention stimulated and spurred to all utmost developments by the commercial enterprise of a continent of seemingly exhaustless resources. Compare Michael Angelo with the "Soaring Bird of Freedom"! In the old country, however, the soaring qualities of steel-framed construction are limited by considerations which we need not discuss, for among the disadvantages of living in a city of the old world are to be counted an equitable right to light and air within one's building, and in narrow streets this involves a limitation of nearly every one's right to soar in building materials; and as the general sanitary conditions of the street itself are affected by the preservation of sunshine and air, they have become one of the many cares of "our excellent grandmother."

Architecture of Iron Construction.

Iron and steelwork have, however, entered so fully into the marrow of the building construction of our street architecture that walls, properly so called, are now few, generally the normal pair of party structures only, the remainder consisting of panels of brick or stone material filled into the framings of metal-work, while the floors themselves have in all important premises ceased to be of wood, and are of iron filled in with concrete or terra-cotta. The main problem of all construction—that of the distribution and carrying of weights—is also most profoundly affected by steel construction. The sectional area required in the supports is so limited, and the spans of the bearing girders so great, that the traditional proportions based upon wooden beams and stone arches, which have become almost a second sense of mankind universal, are no longer of any value, and this essential and fundamental factor of constructive proportion should and must reconstruct the visible expression and meaning of the symbols derived from the stone and wooden architecture of the past. These symbols exist in the mouldings, cornices, architraves, capitals, bases, and detail of the architectural ordinances of the various so-called styles. The modern architect must emerge from his museum of paleolithic implements and enter upon the iron age of commercial architecture with a good heart and reliant enterprise. The new factors of proportion are as valid as those that have passed away, and there is the same universal sense of that which is just and true to ensure the appreciation of intellectual motive, which is itself the sense of the beautiful in architecture. The new "half-steel" has exactly the same claim to be interesting first and beautiful afterwards as its exact forerunner the "half-timber," and may and should be studied and applied upon the same principles of expressive characterisation of constructive facts. The rivet heads, stiffeners and knees of framed girder and stanchion work are similar elements to the oak pegs, bracings and bracketings of our charming old English fronts. That has passed away with the sweet forests of Robin Hood; this remains with the black country of the smelting furnace and coal mine, but is as real and more real to us, as true indeed and as noble in service if looked at straightly without the pseudo-medieval squint of a false aestheticism.

Again, the old English frontispieces are charming to us because the glazing is all little pieces connected together by leaden strips, and our modern English warehouses disagreeable and inartistic because the glazing is of the more suitable and perfect material of plate-glass of modern discovery; this is an anachronism which illustrates that conflict between current artistic ideas and common-sense which has had

so malevolent an effect upon our business-house architecture.

The steel joist and stanchion not only have their use, and that the principal one, in the general construction of modern city buildings, but concern our subject mainly in their appearance or, perhaps we should say, non-appearance upon the street front. By their aid the shop window is enabled to extend itself across the whole site, and this advantage the commercial man cannot be induced to sacrifice for any architectural fancy of the necessity of visible support for its superstructure. It does not matter to him what the architect does with the girder so long as he provides unhindered space for the exhibition of wares. Its uses to the builder are many and obvious; it dispenses with arches and their thrusting or weights, it carries these certainly to the points of support; it receives the floor joists easily, and is so rapidly constructed and fixed that the poor architect has to be content and accept it, though he endeavours to satisfy his artistic conscience with delusions by masking the objectionable girder in stonework and resigning all criticism of the lower storey, beginning his own conception above it. But the ironmonger dogs the artist's steps still, and in window lintels and supports asserts remorselessly the value and economy of metal over stone and wood; the wide windows high up to the ceiling and low down to the floor, perforce, must be spanned too by girders, as there is so little room for rising arches or other means of construction, and these again are covered over with more or less delicate stone mouldings attached and pinned to the iron frame in an indescribably unconstructive manner. Few architects have as yet had the courage to think out an iron architecture, say, with glazed brick, terra-cotta, stone or concrete fillings. There have been encouraging experiments, but the mental effort of departure from the well-worn conventions of stonework design is apparently too great for the generality of street-architecture practitioners.

Modernism in Design.

The architect may find some difficulty in adapting his taste to his sense and his sentiments to business judgment, but ere long the sounder ideal of modern common-sense in these matters will be found as enjoyable as that of an old England, which is at the best unreal and imitative and, however charming and possible in the circles of ecclesiastical and domestic art, is inadmissible in the sphere of modern progressive commercial building. The meeting of architectural art and business life will not be found upon any ground of compromise between that which is ancient and modern, or between that which is ideal and practical, but in such a practical employment of modern conditions as will lead the way to further usefulness and appropriateness in building.

A whole-hearted acceptance by architects of the doctrine of a frank modernism of design and construction in business premises is sufficient requirement to make of them for the establishment and growth in our midst of a healthy street architecture, which, expressing the movement of the age in its requirements, will reflect the intellectual attitude of trained and artistic minds applied to a commercial

problem in building. The profitless and stupid antipathy that is supposed, and partially exists, between commercial and artistic character should thus, at all events in architecture, cease to be confessed, and having reformed the attitude of art to business life we can the more sincerely and successfully hope for and attempt the resuscitation, for it once existed in pure and noble beauty, of living art in the commercial world.

The employment of modern materials and the joyful acceptance of current requirements as a means of expressing a progressive architecture will, however, bring the architect into conflict with other ideals than those merely of an archaeological correctness or antique style. Serious problems in design, nearly all as yet practically unsolved, await him when the first and upper floors have to be designed over and upon a lofty ground-floor shop, the front part of which occupies all the clear space between the ends of the bounding party walls on each side.

It may be taken as a canon of architecture that buildings must not only be of a construc-

FLATS IN PADDINGTON STREET, LONDON, W.
PROFESSOR BERESFORD PITE, ARCHITECT.

tion that is secure in itself, but must be obviously so; and that a building, however scientifically safe, will not be architecturally satisfactory to the eye and mind unless it also appears to be safe. Doubtless time is a great convincer in matters of artistic criticism, and if a sufficient number of examples of a novel method of construction were put before the world to manifest to it that what is apparently unsafe, perhaps hung upon nothing, is after all perfectly secure and scientific as well, after a time this canon of architectural criticism would be satisfied in spite of itself by the relation of experience to judgment and the disappearance of that distrust of novelty which is a gift of Providence to save men from calamitous experiment.

The Shop Windows.

We should have become accustomed, perhaps, by this time to seeing great and massive erections of weighty stone and brickwork poised upon the slender brass pillarettes, lace-like arches, plate-glass fittings and mahogany fascias of shop fronts; but we are, I am sure, suffering artistic discomfort and deriving no pleasure from their carved and ornamental blandishment owing to the initial hiatus that the system of architectural design employed demands a basement and obvious foundation, and has none. With this difficulty the modern architect wrestles ineffectually; the implements

of his trade were all made for buildings with bases, and he knows not how with them to fashion a modern design without obvious support. The difficulty is everywhere self-confessed, and causes an infinity of interesting and sometimes amusing expedients. The projection of the shop front beyond the general face of the upper storeys of the front, thrown out so to speak as a screen beyond it, is a device only very partially successful; it has a certain sufficiency when the shutters are down, but modern progress is depriving the shop architect of this scrappy resource for architectural effect at close times and on Bank- and half-holidays. The void is there, gaping all the week, with perhaps the flimsiest draperies depending from the ceiling within it, dispelling all illusion as to supporting a very mine of weight overhead. The emphasising of the end piers which mask the party-wall ends, and the development of a cornice with the shop fascia to connect them and form a horizontal bridge, on which the upper part is carried, is frequent. This should be a more satisfactory method, as it would disregard the shop front and its contents, and dissociate the composition of the upper storeys from the lower ones. The failure, however, occurs in that the establishment by this treatment of a factor of architectural proportion integral to the whole front has as yet failed to obtain recognition. The architect supposes that the business has been completed, and proceeds in designing the floors immediately over to dispose his proportions in the traditional way, employing lintels and openings of ordinary narrowness, each of which is unconsciously engaged in defying the exaggerated yawn of the cavern below spanned by a member of their own architectural family under abnormal conditions. It may be more easy to point out than to demonstrate that the system of proportion compelled by the ground storey should be recognised in the design of the upper ones; and though openings above are not required of the extent of that below, there is a logical symmetry of spacing which would take the first factor, and by progressive reduction of systematic sub-

SCULPTURED FIGURES TO DOORWAY, PRINCES STREET, CAVENDISH SQUARE, LONDON, W.

division apply the scale and diminish the proportions harmoniously, with satisfactory results.

The Mezzanine.

We have referred to the usual treatment of the shop or ground-floor storey by supporting pilasters and a carrying cornice with a reversion to ordinary proportions in the upper part, but the treatment of the storey over the shop front as a mezzanine or *entresol*, and as part of the shop front, must not be omitted. A few years ago it was more commonly used as an architectural device for getting over the difficulty of affording apparent support to the upper part than it has been of late years—the later developments of shop design having a tendency to make two storeys of shop fronts extending over an area of plate-glass unbroken by constructive lines, over nearly half the elevation of the build-

ing. The mezzanine proper was enclosed by an arch springing from the side pilasters at the level of the head of the shop front, and spanning the whole frontage, if one of ordinary narrowness, rising to the underside of the floor over the mezzanine; thus an arch is gained of considerable size, and at first sight of some capacity, not only for carrying the upper storeys but of blending the smaller scale of that part gradually and harmoniously with the ground floor.

For single house and shop fronts this method has not proved very successful. It can be easily imagined, and indeed seen in many examples readily called to mind, that a large arch springing from narrow pilasters on the extreme limits of a frontage gives the impression that its thrust must be acting upon the neighbouring buildings—in the most likely cases also shops—and appearing to crush them. The initiated will, of course, understand that this will not actually happen, as the arch is more apparent than real, the weight of the upper building upon it being probably carried on a concealed horizontal girder behind the crown of the arch. The success of the arched mezzanine treatment therefore depends largely upon its neighbouring abutments, and unless these are controlled by the same designer, or pre-exist in a satisfactory way, the experiment is very risky. Instances can be cited in very modern London of lofty and powerfully-drawn arches of brick and stonework carrying with apparent scientific and architectural balance a series of upper storeys, but conveying their weight by every optical demonstration of mechanical law against the plate-glass expansion of a neighbouring elevation of the picture-frame order.

The *entresol* arch is also dependent for complete effect upon a sufficient reveal or exposed thickness on its under-sides to convey the impression of the substance and strength requisite to ordinary walling materials. This becomes difficult, if not impossible, where the shop front is continued upwards into the mezzanine, but can be obtained by recessing the window of the mezzanine upon the shop fascia.

The arched mezzanine treatment is most satisfactory, if not only so with any certainty, when several fronts can be treated alike and a continuous effect, as of an arcade, obtained, the arches over each shop corresponding and providing the effect of mutual resistance to thrust which is required. In such cases there is no reason why the arched construction should not suffice for carrying the wall above, provided that the easement of support required from the neighbouring houses is secured by the mutual covenants which originate in a joint ownership of such rights. The north side of New Oxford Street, towards its western end, affords a successful and satisfactory example of this treatment, the general proportions of the whole block and the reduced window requirements of the upper storeys being harmonised with large openings of the ground and mezzanine storeys by the architectural treatment of the arcade. Though this example may be open to other criticisms as to internal arrangement, it presents a standard to which, unfortunately, there has been no approach in any more recent example of an extended façade of shop fronts. The architect should be urged to continue to make use of the storey over the ground floor as a mezzanine on account of its value in extending the carrying proportions of the shop front, and of combining them with the complementary storeys of the building into a homogeneous and expressive design.

In general, architectural proportion is so much a matter of the relation of the solids to voids, that the designer of a shop-fronted house, limited as he is by earlier considerations, has very few principles left to guide him. The relationship of voids to solids cannot apply to this class of design, because the solids have to be eliminated as a condition precedent to suitability for shop display. The architecture becomes a collocation of window-frames, and the solids of which these frames are apparently constructed are unreal, concessions to architectural fancy, as in most cases the stone piers and window heads are but casings to metal girders and stanchions, large and small alike. Deprived of grouping, confined in perspective, tied to a topsy-turvydom of design, the architect of a shop front has difficulties to contend with which one devoutly hopes that he is alive to.

FRIEZE, NOVELLO AND CO.'S PREMISES,

But it is to be feared that the instructions of his commercial employer that his new front must be exactly like a superior rival's, or must be like the Louvre in Paris or like a Scotch castle, have steeled his artistic soul, and he reflects that it is hopeless and profitless to struggle with a client who has no taste, and that after all he is not paid by him for any other purpose than to provide him with just what he knows he wants.

Names and Signs.

We have not mentioned other artistic terrors, as figure or name tablets, signs and electric starters, in many cases necessary to commercial existence, though rendered so only by the force of a bad habit which could be readily and painlessly cured by statutory enactment. It may be suggested to the commercial world that the "best" shops and streets of shops in London are those where this obnoxious habit of self-assertive emptiness is less apparent than elsewhere, and that reputation and success are assumed by the public to belong to that house of business that dispenses with—to put it mildly—inartistic advertisement. However, as part of that frank modernism which we have predicated for the commercial architect, the provision of significant spaces for inscriptions and of such signs as architecture can, by deliberate forethought and pre-arrangement, make properly conspicuous and artistic at once is a certain part of his problem, and a by no means unpleasant one. Inscriptions and signs add a literary value to buildings which grows in value with every year of their history, and we could foresee a pleasant development of particular symbols and types in commercial architecture expressive of and akin to purpose in the building, of use alike to the tradesman and of interest to the public and artist.

Horizontal and Vertical Principles of Design.

The architectural qualities which can be exhibited in street architecture are thus comparatively limited. In the greater number of cases the front or façade only can be seen and is capable of considered design, though in corner buildings there is a return frontage available which admits of some grouping. The fronts of the many buildings forming a street are each comparatively narrow and lofty, and unless the street is a wide one the general effect of the design can only be appreciated from the limited standpoint of the pavement, either in sharp approaching perspective or in a directly opposite view from a point near to and under the building. These limitations very seriously affect the possibilities of successful results, it being borne in mind that the success of the architecture is that of the executed building *in situ* and not of the harmony of the proportions in true elevation or upon its picturesqueness in an ideal perspective view. The test of satisfactory result rather than of pleasing elevation must be applied rigorously to his work by the architect. This is not an easy thing to do, as each projection and horizontal effect is accentuated, while vertical lines and proportions are all foreshortened from either of the possible perspectives of an ordinary street. London architecture has but few examples of suitable methods of dealing with this difficulty. The horizontal cornice upon the skyline and similar lines subdividing the front above and below each storey of windows are the more usual methods. These have become simple to the designer solely from custom and from the facility with which they are drawn with a T-square, but a free consideration of the problem of designing narrow frontages to lofty buildings in a narrow street would certainly suggest that horizontal lines, with no continuity beyond the limits of a small site, are possibly not the only means with which to attempt suitable design. The varying contours of streets, sometimes broken, curved and crooked, sometimes in long straight lines, would direct some treatment which would not necessarily—as continuous horizontal lines must—throw each separate frontage into violent contact with the proportions of its neighbour.

There grew up in Gothic times in the narrow devious lanes of busy mediæval towns a method quite as universal as the use of horizontal cornices and lines, in the use of vertical ones, the grouping and arrangement being upwards, each window in a storey being grouped over the one below it, the margin lines being made

continuous and carried up into a gable in which the centre one often reached to the top, creating storeys in the roof as it went up. The principle seems more natural and proper, and one can easily imagine its growth among the craftsmen as a necessary tradition of street building, and vindicating itself by its suitability and truth of expression to their artistic instinct. It may be remarked that in other branches of building, all of the same period, such as in the external design of churches, detached houses and castles, there is no such universal tendency of vertical expression in the Middle Ages, the use of ornamental and corbelled parapets tending to complete many aspects of these buildings horizontally. But in street architecture the vertical grouping is very general, and instances of any other principle would be difficult to find and group until the dawn of the Renaissance, which brought with it the cult of the enormous horizontal crown or cornice.

Many examples remain in the Low Countries and in North and Western Germany—as at Lübeck, Münster in Westphalia, and Nuremberg—of the assiduous application of the vertical principle to narrow street fronts, executed in brick and stone, and collectively a more instructive exhibition of the innumerable possible combinations of simple forms upon one method is obtained. Of similar wooden architecture, where the horizontal principle of beam or lintel construction necessarily enters all the construction and design, England furnishes examples in cities such as Chester, Shrewsbury and Tewkesbury, while in Normandy there are many refined examples of beautiful half-timber fronts. The application of a delicate artistic originality emphasizing and giving value to vertical expression can be observed in mediæval examples, and the employment of horizontal steps in the brickwork gables, so characteristic to us of Bruges, is echoed in stonework examples in Westphalia, while the Scotch corbie-stanes, or crow's feet, all subserve the same vertical principle of design. The advent of the Renaissance in Northern Europe did not, as in the South, bring the pedantic use of huge shadow-casting cornices into its less sunny clime—that was left for the pseudo-Italian palaces which made the modern London of fifty years ago so gloomy—but allowed a great freedom of treatment in line and ornament, gradually casting loose from the craftsmen's methods of development from purpose, fitting and subduing all to preconceived notions of architectural effect. Swirling curves and disjointed architectural fixtures soon began to exercise themselves upon the polygon of wall surface provided by the front with its gable, and it was not until the need of a new restraint began to make itself felt that the freedom of rococo treatment was reduced by a steady application of horizontal cornice lines over and under each storey of the façade.

Picturesque Streets.

The happy independence which was obtained by each front, when the vertical method of design was practically universal, procured in the aggregate of a street view a charming grouping and freedom which has a fascinating effect, and always proves attractive to the artist-follower of Prout and Roberts on his sketching tours. The more or less flexible curves of the lines of road and gutters in a winding narrow street combine and yet contrast with the closely-grouped vertical sub-divisions of the house fronts, often broken by occasional projecting oriels or corbelled turrets, or in half-timber work by joist ends and brackets, and with the gable peaks in varying proportions, heights and skyline pictures naturally form themselves without effort of fancy or composition. The charm of a mediæval town has certainly within it a basis of reasonable beauty instructive to us as modern street builders which will bear stripping of its antiquity and associations—that is, of the quality with which we cannot endue our designs—and compare instructively with the artistic effect of more modern thoroughfares, whether purposely architectural as in the chill sobriety of Moorgate or King William Streets, or accidentally arranged on modern lines as in Queen Victoria Street or Shaftesbury Avenue.

We do wish to assure an universal artistic principle of street-building design, for to do so would be to limit the illimitable possibilities of

artistic combination and effect, but from the impressions of result we may derive safely enough the conclusion that in narrow frontages the design should be self-contained, its lines terminating satisfactorily within their own field, and the direction which is to the eye unbounded—namely, the vertical one—being that in which the artistic sense of appropriateness can be best brought to play; while totally the effect of a street or city built of independent but self-contained designs is pleasing, the separate fronts adding together picturesquely in the necessarily horizontal perspective of the streets.

Uniformity and Symmetry: Regent Street.

There are, however, many principles of design and ideas of symmetrical or picturesque arrangement beside those into the discussion of which we have gone at some length.

The principal consideration, in contrast to what we will call the mediæval independence of each frontage, is that of a uniformity compulsorily applied either by that relic of mediævalism most necessary and useful to architectural effect, the lord of the manor, or by special legislation. The underlying idea in such cases is the assumption, almost an unproved one, certainly uncertain, that uniformity of effect in street architecture is necessary and desirable in the interests of dignity and art. This whole doctrine of architectural symmetry has been courageously assailed by Gothic revival enthusiasts, its value denied, and its effects of repetition and graduation scouted, as formal weaknesses alien to the picturesque and truly artistic. The present generation stands in many respects at the parting of the ways. The heat of Gothic vigour has evaporated, and we are prepared to consider its artistic assertions at least as coolly as we have regarded the orders and proprieties of the preceding school which produced Regent Street and park.

Within the last half-century public taste, national genius, or what you will to call that will-o'-the-wisp, has romanticised into mediævalism with its guilds and crafts, ideally uniting work with art in life, and not in vain; also not in vain has it discovered the charms of the Bloomsbury and Soho view of art life, with its sober respectability of external appearance and delicious completeness within, reticent to plainness about the house and home, and serenely Athenian in monumental churches and porticoed institutions. While this sprite of fashion is at present dissipating her enthusiasms in a somewhat libertine interlude, we can do no harm by putting in a plea for the organised hypocrisy of Regent Street, with its many and various dispositions and sub-divisions successfully masked in stately groups and blocks culminating in the magnificent quadrant, new-made annually with fresh paint which renews every architectural feature with whiteness of surface—and is not architecture but mainly surface matter, after all! The sense of scale, of grouping, of harmony and of successful regulation still survive in Regent Street, though well-nigh three-quarters of a century have elapsed since it was designed, and of all London streets it is yet the only one of which, as street architecture in total, we can in any way be proud. We must not fail, though, to qualify our self-congratulation by the objections which lie below the surface, for they will practically prevent an entire repetition of the experiment. The stately grouping of varying blocks has been achieved mainly by the sacrifice of what to-day would be altogether too valuable comfort in arrangement and of market rental value in the "upper parts." There is a manifest wrestling between internal facts and external appearances, which struggles with windows, parapets and roof lines. The pleasant proportion of width of street to height of building will be rarely attained now in any great city, and the charm of curved line on which the whole street scheme is planned from St. James Park to Langham Place is uniquely happy in its architectural effect. The effort was a great one; the genius of Nash one for the occasion; and the result characteristic of the age that produced it, and serviceable and delightful to that which has followed. London would frankly approve of a repetition of the occasion, effort and genius, and of a result as expressive of our generation as of that of the First Gentleman of Europe.

Speculative Building in Important Streets.

A practical aspect of our subject sorely presses us to-day in London, and to some extent in all our larger cities. We have been considering the improvement of our street architecture upon definitions of the requirements of commercial buildings, and the way in which the architect seriously devoted to the advancement of his art can meet and give them artistic expression. These requirements postulate as a requirer an intelligent progressive man of business, as also a sympathetic and trained architectural mind to consider them. But practically neither the business man nor the architect have anything to say upon the matter in a way which can affect street architecture, for their buildings are ready made for them. They are the production—and as such also express the characteristics and ideals of their producers—of building investors who, buying or securing the most prominent and serviceable sites, have erected speculative shops and warehouses upon them as ready-made goods for the purchaser. I do not propose to take any exception here to the speculative purchase of land likely to become valuable, or to its being offered at the highest obtainable figure; and though it is gravely open to doubt whether the policy of providing ready-made buildings is the best and most profitable either for the promoter or purchaser, or for both, I conceive it well to be within the proper limits of our subject to protest in the name of our commercial men, in the name of architects and of all passers-by who have regard for the pleasant, decent and beautiful character of the cities of our land, against the outrageous garity of design, ignorance or defiance of elementary considerations of appropriateness, of proportion and of architectural suitability in expression, and against the abominably bad ornamentation that characterise the great speculative building blocks recently erected and now being carried out upon many of the most important sites in the metropolis. There seems to be no protection for the public, refined or refined, against the insults to taste and national self-respect by which the sordid incapacity of grossly ignorant men defaces our finest and most important thoroughfares. The architecture of the whole class of speculative building is normally of a low class, but since this element has invaded the more expensive sites and proceeded to erect buildings demanding the highest rents the depths of the degradation of speculative building art have received a new exploration and exposure that is appalling. Kind nature makes us slowly oblivious to constant or recurrent physical pain, but, speaking from painful experience, I cannot discover any such alleviation in the doom of having to come into daily contact with buildings in high places exhibiting the worst effects of architectural degradation. Indeed, a settled despair of London, in spite of much in many directions to give bright hopes of oases of cheer in the desert, drops with chilling and deadly effect upon that zeal without which an architect is fairly useless to his fellows and his art. A really bad building is a upas tree, to be destroyed, as rapidly as possible, and of the real badness of this branch of modern street architecture no one has any doubt. It is not even to be expected that the promoter or even his architect (so-called) possibly knows or cares

that it is bad or good; their interests are otherwise entirely wrapt up in present profits, and these are compelled by the occupation by their buildings of certain positions, and ensured at no more or less, whether the architecture is a source of pleasure or pain to the citizens upon whom it is forced. We protest; if we can do nothing else we will make this beginning by crying revolt against a shameless bad architecture, continued disgrace to our building art, commercial intelligence, national self-respect and civilisation. There are no good points, not even of arrangement and suitability or improvement, in the design of these blocks, and their construction sails as near inefficiency as the administration of a difficult statute by hard-worked and heavily-handicapped district surveyors can allow.

Regulation of Designs.

In conclusion, it is not, perhaps, much good railing at a blot, however iniquitous, upon the surface of a city; but as the mischief is spreading rapidly, we would point out again that, while not limiting buying or selling, free trade if you will, in land of public or private importance, there is a definite call for such a censorship, as liberal as you like but cultured and wide, that will prevent the intrusion of ready-made or purposeless buildings of hideous and incompetent architecture upon our public streets. With good will some reference to authority of designs in important streets of distinctive character should be readily obtained, not only as at present exists by statute upon construction, height, purpose and accommodation, but upon the more widely-dispersed, though less concentrated evil, of bad design. There is as yet no sufficient standard of public taste to enable us to trust such censorship without fear of controversy in the hands of any mere officials, but with the organised societies for the promotion of the fine arts and architecture and for the improvement of our cities there should be no difficulty in obtaining sufficiently large committees of taste willing to proffer advice and criticism and exercise veto without illiberality or narrowness. There may be danger in this suggestion, the censorship may prove either a stork or a log to the frogs, but there are greater dangers in the continuance of the existing state of things, for some of the best streets of London are already marred and appear to exhibit a gross decadence of public taste, which is really as untrue as any other artistic characteristic of such buildings.

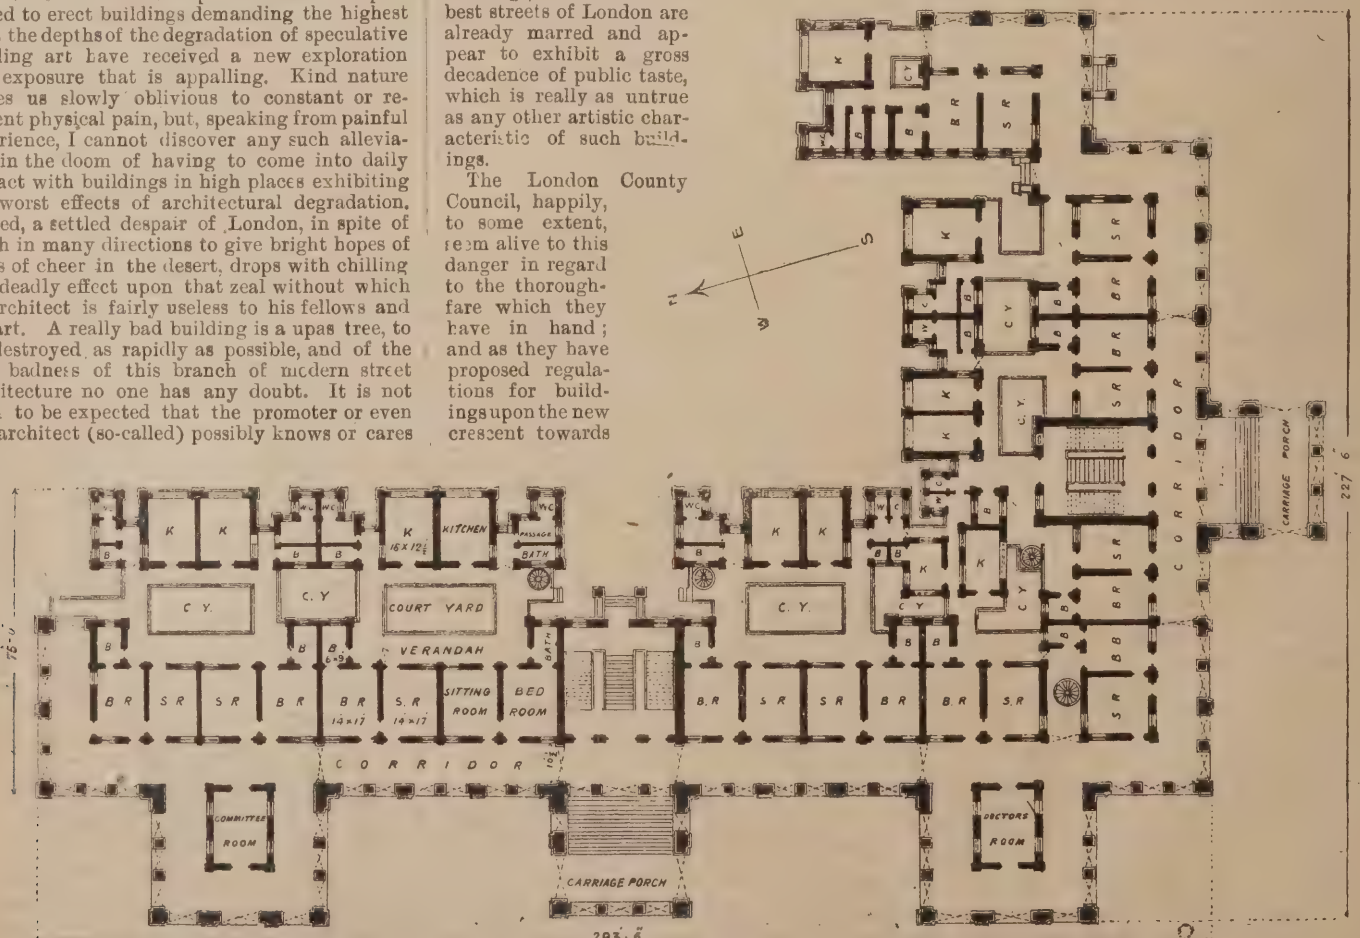

The London County Council, happily, to some extent, seem alive to this danger in regard to the thoroughfare which they have in hand; and as they have proposed regulations for buildings upon the new crescent towards

the Strand, and have held a tentative competition for uniform designs, that certainly mark a progression of ideas in the direction of proper control. But the subject is one of great difficulty and complexity; and unless the control is in the first place wisely directed in the true interests of successful architecture by highly competent hands, and in the second is so entirely firm by enactment and covenant that it cannot be broken away from, the experiment will not be successful. These two conditions are not unattainable, and Londoners hope for much, as as they always do, in spite of much disappointment. Into the discussion of the great new street from Holborn to the Strand, so full of detail and interest, we cannot now enter if we would. The preliminary work is too far advanced for suggestions to be of much value to the authorities, but we can and do appeal to all who build in our streets, whether promoters, owners, men of commerce, of speculation or of public purpose, to employers, builders and architects alike, to consider how deeply important is the right use of every opportunity of permanent building to the whole city; and if character is written in stone, wood or iron, that character should reveal devotion to the highest ideals.

Masters and Men.

The Operative Painters at Horwich are on strike for an increase of wages from 8d. to 8½d. per hour so as to bring them up to the same rate as Bolton. The masters refuse to give the advance to all the men, but special hands are now engaged over the sum asked for. One firm has granted the advance.

Coventry Building Dispute.—The Coventry building dispute is settled as far as the bricklayers, labourers, masons and painters are concerned. An alteration of working hours in the winter months has been agreed upon. The carpenters and joiners are asking for an advance of a farthing per hour. If they decide to insist upon their demands, then the question will have to be submitted to arbitration as the rules provide.

THE FRAMJEE DINSHAW PETIT PARSEE SANATORIUM, CUMBALLA HILL, BOMBAY: GROUND PLAN.

ARCHITECTURAL ASSOCIATION.

Mr. CARÔE ON THE PRESERVATION OF ANCIENT BUILDINGS.

A SPECIAL general meeting of the Architectural Association was held at 9, Conduit Street, W., on Friday evening last. Mr. E. Guy Dawber, vice-president, who occupied the chair, proposed that the following alterations and additions be made to the by-laws:—

By-law 26: Substitute the words "first ordinary general meeting" in place of annual general meeting.

By-law 30: Omit the words "hon. auditors."

Omit by-law 36.

By-law 42 to read: "42. The first general meeting during each session shall be the annual general meeting for that session, and at such meeting the prizes shall be distributed, the president shall deliver an address, and short addresses shall be invited from senior members of the profession. At the first ordinary general meeting each session a statement of the accounts of the Association, duly audited by a professional accountant, shall be laid before the members."

These alterations and additions were agreed to. The ordinary general meeting of the Association was then held. After the minutes had been read and confirmed, Messrs. H. C. W. Dod (London, N.) and J. A. Maxwell-Stirling (Madras) were elected members of the Association. The chairman then announced the following additional donations to the New Premises Fund:—

	£	s.	d.
Worshipful Company of Clothworkers	50	0	0
J. T. Christopher	10	10	0
C. Harrison Townsend	10	10	0
Louis Ambler	5	5	0
A. M. Torrance	5	5	0
O. F. Longden	5	0	0
H. Longden	5	0	0
F. Lishman	3	0	0
R. W. Collier	2	2	0
C. Dunch	2	2	0
E. W. Lees	2	2	0
W. J. Norbillard	2	2	0
A. W. Papworth	2	2	0
J. D. Slater	1	1	0

Donations previously announced 106 1 0
3,957 7 6

Total £4,063 8 6

Mr. R. S. Balfour announced some additions to the library, and the chairman then read the House List for the next session, which included Mr. Henry T. Hare as president, and Messrs. W. A. Pite and Louis Ambler as vice-presidents.

Mr. W. D. Carôe then read his paper on "The Preservation of Ancient Buildings." After referring to the Cambridge Camden Society the lecturer spoke of Sir Gilbert Scott, with whom the attempt to reconstruct the past rather than to preserve it grew like a fungus, plunging a great and deserved reputation into the dust. Reference was next made to restoration in France, Germany and Italy, where a large number of ancient buildings had been changed into cast-iron echoes of themselves. Viollet-le-Duc deliberately set before himself the goal of recovering the supposed form of a building at that precise period of its existence which he pedantically elected to be the most beautiful, or most interesting, or both. Leon Cathedral in Spain was an example of this method. The façades, the guide-book tells us with satisfaction, "have been purged of their Renaissance disfigurements," yet observe the inanity of the "Gothic" which has taken their place.

Mr. Carôe continued:—The restoration of the walls of Carcassonne, upon which, under Le-Duc, the French Government has wasted untold thousands, and aided by which Le-Duc was able to lay before us with a scholarly intuition and definiteness worthy of all praise the history and science of Romanesque and Mediaeval fortification, forms a striking, not to say ludicrous, example of the failure of the method, even in erudite hands. The further works now in progress in which Le-Duc's methods are being carried forward are really more comical than words can express. One is indeed tempted to ask if these men are quite sane. All over Europe works of a similar kind have been during the last thirty years, and still are, in active progress, and yet the modern spirit of a newly-emancipated continent is such that these gross misprisions of antiquity are warmly approved, and mediæval travestie

are too often regarded as glorious national monuments.

If I am asked for examples, they occur in every town, almost in every village: Angoulême with hardly an ancient stone left undisturbed; Leon largely rebuilt; Upsala a modern building; St. Mark's, Venice, externally an engineer's construction; St. Front, Perigueux, with the bottom knocked out of its remarkable history; Albi restored, and now being re-restored apparently for the sole cause that the French Government does not know what to do with its wealth; that marvellous courtyard of St. Gregorio, at Valladolid, wrecked and rebuilt, and all its wondrous carvings scraped up into soapy whiteness; the delightful sculpture of Wisoy being recarved because the architect (he told me so himself) thinks they are archaic and the heads too big for the bodies, and that he can draw them better, brilliant draughtsman as he undoubtedly is; Trondhjem and Stavanger new cut; Frederiksborgslot restored by a brewer like unto a public bar. And in Germany! The restorations made in Germany are more appalling than words can tell. I know not where to begin nor where to stop in referring to them.

I am not exempting our own country. We have suffered grievously—irrevocably—and not the least from the curious revivalist heresy that the art of architecture stopped short in the year of grace 1534. We are still suffering, but fortunately a sounder sense of proportion, which I am here to advocate to-night—the sense of preservation—is gradually making headway among us.

In passing, I refer to one other "grim" one-man school of destructive restoration, which is fortunately individual and unique—the brutal, ignorant, conceited, self-opinionated "school" of Lord Grimthorpe. It has been as much a disgrace to the century and the Church which permitted it as to the man who has had the effrontery to direct and to pay for it. Silence is perhaps most meet where memory is pain.

Parallel with this, but unfortunately on a wider plane, is the rapid destruction of ancient monuments to make way for so-called modern improvements. We witnessed lately how our County Council destroyed Tudor House to make way for an extra bit of asphalt.

But preservation, too, has its extreme forms which, like all extremes, carry their dangers to a good cause. I am most fully in sympathy with the primary tenets of the Society for the Protection of Ancient Buildings, but I must not be held to endorse all its methods.

I commend the various advisory leaflets issued by the Society, with special mention of Professor Church's recent admirable excursus upon wall paintings. They are generally sound and practical and instructive. But there will not be found very succinctly laid down the following somewhat inchoate and elusive principles which I have endeavoured to cull briefly from some examples executed and statements made by members of the Society:—

1. As a general axiom, a building is to be considered as a gem in a glass case. To touch or disturb it in any manner whatever is an act of sacrilege (a sentiment with which I, for one, heartily concur).

2. Nevertheless, you may whitewash it to any extent. You may rake out the inside of the walls, and substitute blue brick for old core without stint. You may rebuild or finish an interior with blue bricks, or you may patch up cracks externally with blue bricks.

3. But you may not patch them up with the original material of which the wall is built. That is counterfeit.

4. When you come to tracery, however, you may repair that in stone, and make such a copy of the old as you may be capable of. That, somehow, is not counterfeit.

5. You must underpin on all possible occasions.

6. And just as you may use whitewash, you may also use plaster. You may, indeed, "restore" ancient plaster in the fullest sense of the obnoxious word. In the eyes of the Society there is some special virtue in plaster as a mediæval building material which claims for it a treatment more exacting than you might accord to highly-wrought stone or timber, let us say.

7. Finally, the Society for the Protection of Ancient Buildings may advertise you and itself,

or you may advertise the Society for the Protection of Ancient Buildings and yourself, in the Press, or on quaintly-lettered tablets—if, that is, you are acting under its agis.

8. But woe betide you if you attempt anything whatever in any direction in connection with an old building without such imprimatur.

Here, then, I have briefly referred to the methods of the extreme schools on either side. The first is purely destructive, and the second creates in place a reactive method, apt to impress itself in illogical fads, as for instance when it whitewashes Exeter Guildhall, and is quite ready, we have been informed, to whitewash Westminster Abbey.

Now, I believe that wisdom lies once more in the *Via Media*.

If the tower and spire of Salisbury Cathedral were to fall to-morrow (from which catastrophe we have lately been saved by a restoration in defiance of every precept of the S.P.A.B., but against which no word of criticism was breathed), will any one say that we should do wrong in rebuilding it on the old model, and all that it destroyed in its collapse? I certainly should recognise such a reconstruction as a legitimate "counterfeit." Too many windy words have been wasted over so-called "counterfeits." Do we blame the Perpendicular builders of Westminster Abbey and accuse them of counterfeit because they imitated the Early Decorated style, and in some places very cleverly? Or do we call in question Mr. Micklethwaite's work, daily growing at the west end? It is, as I understand, a necessitous reproduction of ancient forms.

There are two primary principles which govern all cases:—1. In an ancient building not a stick nor a stone shall be moved if a sufficient reason is forthcoming to keep it where and how we find it. 2. When the work is done, no modern workman's mark shall be seen wherever such can be avoided.

The question arises: "How far is the ancient to give way to modern requirements?" Primarily the answer is, and this must be our third principle, "It is not to give way." Nevertheless, common-sense says that a building whose life, so to speak, is active must be suited to the needs of the day, within reasonable bounds. But I would ask you to bear in mind steadfastly that the tendency of to-day is to do too much, and you will never err on the wrong side if in the matter of adaptation (I am not now speaking of stability) you do too little. You cannot preserve too much.

It may be convenient at this stage, after the mention of these three guiding principles, to subdivide the buildings with which we are called upon to deal into three classes:—

(1) Ancient buildings which have continued in the use for which they were erected up to the present, and which it is desired to preserve for the same use—cathedrals and churches chiefly, detached monuments, some mansions and schools.

(2) Ancient buildings which have gone out of use, but which it is desired to recover to their old use or adapt to a new one, or incorporate into the midst of new buildings—old manor houses become farms, or farms become cottages, or ancient school buildings incorporated into a modern growth.

(3) Ruins of ancient buildings which it is desired to preserve as ruins and to prevent from further decay.

Now, while the same principles will govern in all divisions, the practice in each will vary somewhat. In applying them, let me recapitulate succinctly the three principles already enunciated:—

(1) Nothing shall be touched which can be left alone.

(2) We must efface our own work.

(3) Ancient work shall not give way to modern needs.

These are primary precepts. Hardly in any case will it be possible, unfortunately, to fulfil them; but according to the measure of our success in doing so in our work will that work be itself successful.

A fourth general principle applicable to all cases has to be stated, although it goes as a matter of course.

(4) Our first efforts will be directed to the stability of the building.

A fifth will, perhaps, not be so generally accepted in regard to all three divisions; it is

(5) The beauty of an ancient building is not to be marred by inharmonious accessories for any purpose whatever. The proposal, for instance, once made to build great brick buttresses to prop up the west front of Peterborough Cathedral I regard as simply brutal and an insult to the designers of that remarkable work. I cannot subscribe to Ruskin's precept, "Do not care about the unsightliness of the aid," although I admit its argumentative effectiveness.

The sixth and last general principle will be :

(6) In all cases ivy must be removed and destroyed.

Mr. Caröe then proceeded to deal with these principles in detail as concerned with the three classes of buildings under consideration, in the course of which he said :—

First see to your foundations. Remarkable although their work was above ground, the medievalists were sorry scampers in the matter of foundations, and they seemed to have exercised no forethought as to the weight they proposed to put upon them. It follows that underpinning is a frequent necessity.

Next repair the cracks and consolidate the core of the walls. I need hardly mention the utility of liquid grout in this connection, but must warn you not to use fresh cement.

Then we have often to deal with leaning walls. The idea that a wall is dangerous or necessarily going to fall because it leans is an absolute, if popular, fallacy. The mechanics of the question are simple enough. Remove all lateral pressure and the wall will not fall until the line of the centre of gravity passes outside the base. If the wall be buttressed there is a still greater angle of safety.

Let us pass to the repair of decayed stonework. The panacea for such decay, as advocated by the Protection Society, is whitewash. The panacea of the restorer is of course wholesale reconstruction. Now, a committee of chemical experts and architects has been sitting for a prolonged period in the endeavour to discover some process by which the unfortunate decay in the stonework of Westminster Abbey may be arrested. Where such decay has taken place in stones of which the chief constituent is carbonate of lime, and where the cause is the sulphurous emanations from the modern town atmosphere, which convert carbonate of lime into gypsum, a soluble substance, an arresting remedy has been found in baryta-water (hydrate of baryta). You may see the effect inside the chapter-house, which has been dealt with under Professor Church's able direction. Unfortunately in other places, where such a remedy was most needed, it proved a disappointment, and it is evident that it can be used only with the greatest circumspection. But the committee's report will be awaited with interest, especially if it determines for us the value of whitewash.

And what of the wholesale restoration? I adhere definitely to my precept No. 1. I should always myself advocate the employment of two architects in collaboration on any work of reparation, so that rashness or error or ignorance might be curbed in their effects. But in any case I should like to see constituted an authoritative committee to whom the younger man—and his senior, too, for the matter of that—might come, free of cost, for the resolution of his doubts and difficulties.

Now, the principles I have suggested for stonework apply generally to woodwork.

The beautiful roof of Gedney, Lincolnshire, was in the last stages of decay and dilapidation. The walls were pushed out and cracked in all directions. It was repaired without moving a single timber from its place. I can conceive no greater stigma attaching to an architect than that he finds it necessary to replace an old roof with a new one because the old one is seriously decayed.

In your windows recollect the vast importance of iron stanchions and saddle-bars, and on no pretext allow the ancient ones which you find to be done away with. If the iron has rusted in the stone, it should be temporarily removed, the rust filed away, and while the surface is bright it should be reset in cement. Paint it then with two good coats of red oxide before it has its two final coats of black, and it will not give trouble again. Stand out as far as you can against wire-protecting guards to stained-glass windows. I find that these make excellent

chicken runs for the parsonage garden. A word further of warning, and I have done on this head. If you find cracks in your tower, look to your bell frame.

Mr. Caröe closed the consideration of churches by briefly applying these principles to a hypothetical case in which an architect is called upon to "restore." He next dealt briefly with the second class of buildings, to which the general tenor of his preceding remarks applied, after which he spoke of the third and last class—ruins. He said :—I have reserved till now the sixth principle—the destruction of ivy. Of course I shall be told that I am advocating the destruction of the picturesque, but it is not so. Quite apart from the destructive qualities of ivy, the entire concealment of architecture by any evergreen growth is merely the rendering of it valueless. One is reminded of the seer of Brantwood's words: "The artist who looks to the stem of the ivy instead of the shaft of the pillar is carrying out in more daring freedom the debased sculptor's choice of the hair instead of the countenance."

Of course, in the early days after ivy destruction your building looks bare and unclad, but take heart and counsel. Nature has provided a most happy substitute, which is as harmless as it is beautiful. You may plant *ampelopsis viticella* to any extent, the lovely light-hearted and fickle but always tender sister of the stern and solemn ivy. After two or three years of patient tending and watching the growth of a plant which has tested and likes its situation is almost phenomenal. You have the lovely daintiness of the spring leaves, the richness of the summer green, and the glory of the autumn sunsets. And when the glory has departed, all your architecture is revealed again, with the slender tendrils only adding texture to the walls.

At the highly interesting church of Westwell, near Ashford in Kent, a church where the thirteenth-century groining is done in concrete, this lovely creeper has been permitted to grow over the window glass, which it loves to do. The glass is fortunately transparent. The effect is more beautiful than any modern glass-painter has ever conceived. I commend it to you.

To recapitulate :—First, get rid of the ivy on your ruin. The thick stems should be cut at about 3ft. distances and dressed with corrosive sublimate or any strong destructive chemical. The ivy must not be torn down from the face of the wall until it has lost its power of clinging, and should then be most carefully removed by the aid of scaffolding, and, what is still more important, the aid of tender-handed and careful workmen.

Obviously the most important duty is to protect roofless walls from the inroads of rain and frost. The method adopted at Kirkstall was to carry the irregular walls up to more or less the same level and cope with flat stones, slightly weathered. This, no doubt, is practically effectual if the coping stone is good. But the sacrifice is very great. The building loses its picturesque claim as a ruin, and becomes formal at once. I cannot see that so drastic a treatment is necessary. It is quite possible to remove the soil and vegetation from the rough wall tops, and grout them in with cement, leaving their irregular contour, and it is only necessary to provide for carrying off the rain with fairly even distribution.

We come now to the difficult point of the treatment of reconstructions of an ancient building, necessary for its proper sustenance.

Occasions arise where it is absolutely necessary to reconstruct part of an arcade, an arch, or a buttress, or perhaps a vault, or some tracery. It appears to be an accepted principle, even by our keenest historic friends, that where old stones exist and their approximate position is known, they may be put back—re-used. But the doctrine has been put forward and acted upon that although you may build part of a feature with its old stones you may not add to their number by new stones to the same section. Now, I do not hold with this system. I protest strongly against it, for I believe it to be false in logic as it is injurious in effect. If you are afraid of falsifying history, there are two courses. Either rebuild in rough-hewn masonry, which will tell its tale, or copy the old as nearly as you can, but put a mark or date on each stone if you

will leave some imperishable record of your work.

Gentlemen, the subject I have ventured to bring before you is not less difficult because barely two minds think alike upon it, and I can but hope that my views will receive their meed of criticism. But I hope, too, it will be kindly, and will give me the credit of pressing before all else upon the keen restorer the doctrine of "hands off," of recognising an actual as well as a sentimental beauty in time-worn and time-honoured antiquity, and of using my utmost endeavours to preserve what can be wiped out in an hour and, like Humpty Dumpty, never picked up again.

A discussion followed in which Mr. Aston Webb, A.R.A., Mr. Thackeray Turner, Professor Beresford Pite and the chairman took part.

Views & Reviews.

The Formal Garden.

The technical excellence of these illustrations is very great; they are of a good size and are well printed on stout paper: so that they make a very pleasant and useful album, pleasant on account of the beauty of some of the gardens shown, and useful for copying purposes for those who desire to produce miniature Hampton Courts and small models of Wilton Houses. Mr. Triggs's sketches are clear and unelaborate, their object being to set forth the plans and main details, while the beautiful collotypes present the gardens in all their charm of leaf and sunlight. The formal garden, however, can be carried too far, so that its artificiality tires and its absolute uniformity makes the observer long for a patch of grass that is not sliced up like so much brawn, or for a ragged piece of wood where the trees do not grow like pencils nor the bushes like tubs. Many of the gardens illustrated in this collection are very fine—there is a certain theatrical effect about them which pleases, and the grand scale on which they are carried out is undeniably imposing—yet the most beautiful of them all is the least formal: for the Privy Garden at Hampton Court, with its lovely trees growing in wild harmony and its peeps of lawn and path, is far more charming than all the rest: let it be compared to the very formal garden of Trentham Hall—both have a river as background—and its advantage is at once evident. Another contrast of a somewhat similar kind is offered by the Italian Garden of Wilton House, with its fine vista along the path that runs between the tall trees: here the beds are cut up unmercifully and the restlessness which they exhibit is only emphasised by the quiet expanse of lawn to the left.

Besides those already mentioned, the formal gardens of Drayton House, Hatfield House, Levens Hall (Westmorland), with its clip hornbeam walls, Balcarras (Hertfordshire), Kinross House, Drumlanrig Castle, and the beautiful terraces of Barmouth (Lanarkshire) are included in this portfolio, in addition to which some garden vases and a number of English and Scotch sundials are illustrated, and a fine view is given of the eagle-crowned entrance gates to Drayton House. To those who like formal gardens this additional collection will appeal at once.

"Formal Gardens in England and Scotland: their Planning and Arrangement, Architectural and Ornamental Features—Part II," by H. Inigo Triggs, A.R.I.B.A. London: E. T. Batsford, 94, High Holborn, price 21s. nett.

Much Art.

Sir Martin Conway, having for the past ten years occupied himself in great travels, more especially among the high mountains of the earth, people have forgotten (or never known) that for many years previously he devoted himself to the study of art. Now, however, as Slade Professor at Cambridge, in the volume under consideration he amplifies the views which he set forth when Professor of Art at Liverpool. This volume has no special literary merit, but the author, as one might expect, deals with the numerous problems in a very clear and practical manner; he acknowledges the requirements of the day, instead of ignoring them, like most writers on art; and he does not

wander into those regions of involved rhetoric or chronic moaning which are seemingly so attractive to many weary critics. Sir Martin Conway, in his first lecture, condemns the proposal to tax site values in cities, which he rightly considers would have a ruinous effect on the remaining open spaces, and he also has a strong word to say against committees of taste; but we are glad to note that "England is not a country of hopeless Philistines. Probably it does not contain a larger percentage of Philistines than Athens did in the days of Pericles. It is the structure of our society which is Philistine, not the units of which our society is composed." Sir Martin covers a lot of ground in his lectures, and he deals with so many subjects that it is impossible even to mention a tithe of them here, for they range from the art of living to photographic collections, and from "atmosphere" in a picture to the introduction of turnips from Holland. These subjects are, however, well knit together, and the teaching about them generally sensible and wholesome. The author has much to say about journalism and art, and he invokes a mead of pity for the poor critic who has one day only to rush around an Academy exhibition and is required to give his comment to the world the next morning. "Almost every artist declares that the whole mass of published art-criticism is worthless; yet probably nine artists out of ten subscribe to press-cutting agencies."—Sir Martin has indeed a sense of humour.

"The Domain of Art," by Sir W. Martin Conway. London: John Murray, price 7s. 6d. nett.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Hoods for Grates.

LIVERPOOL.—T. V. H. writes: "Kindly name a firm who make or stock metal hoods for dog-grates to brick flue."

Messrs. Young & Marten, Caledonian Works, Stratford, E.

L.G.B. Accounts.

CAMBERLEY.—W. V. M. writes: "Kindly explain how to enter up the stores account book prescribed by the L.G.B. The word 'stores' includes highway 'materials,' and if a page is to be reserved for each class of stores, one will have about fifty pages open for grass seed, dust wagons, horses, scavengers' brooms, shovels, picks, &c. Is this what is intended?"

The workings of the official mind being peculiar, if not extensive, it is impossible to say definitely what the L.G.B. require, but the querist can hardly err on the side of too much detail. But as few accounts (practically ledger accounts) as possible should be made, grouping miscellaneous matters of a kindred nature whenever practicable. Dust wagons, horses, brooms, &c., are, however, not "stores" in a legitimate sense; they should rather be classed as "plant" and excluded from the stores account book. No hard-and-fast rule could be laid down, because in a large district a multiplicity of accounts would be requisite which, in a smaller district, would be ridiculous. H. E.

The Use of Deal.

LONDON, W.—W. J. S. writes: "During some alterations to an old house in Canterbury we unearthed a small carved panel of deal wood which had scratched upon it the date '1404.' As doubts have been thrown upon the fact that the panel is really of this age, can you state whether deal was in use at that time?"

I know of no instance of the use of deal for architectural work in this country earlier than the sixteenth century. It is not at all likely the date "1404" is genuine. The earliest so-called example of the use of deal I ever saw is the old Stavekirke, originally the parish church, at Fortun in Norway, but removed bodily some

years ago to private grounds a few miles outside Bergen, in that country. It is said to date from A.D. 1150. I have had opportunities for examining it very closely, and if one excepts the two doors (both more than 3ft. wide and cut from a single plank) and some panelling, should think the greater part is not more than fifty years old, whilst the rest is even more recent. Steven's brown stain is much in evidence everywhere. Indeed, like the proverbial Irishman's coat, the fabric has been so often patched, mended and restored, that not a bit of the original structure remains.

HARRY HEMS.

Vibration of Bell Frame.

STROOD.—A. CAMPANILE writes: "The accompanying drawing (not reproduced) shows the (apparent) construction of the floor carrying a bell frame and six bells. Although very massive and clumsy it is unsatisfactory, and the rubble walls are much cracked. How could the vibration caused by the ringing be better absorbed? Would it be better to remove the bolts by which the carriage is fixed to the floor, or fix it more securely? Would it be better (and worth the expense) to remove the stonework from around the ends of the beams and leave them as shown?"

If the walls of tower are much cracked it is doubtful whether they are safe. Vibration from

VIBRATION OF BELL FRAME.

the movement of the bells may be reduced by increasing the weight upon the floor, which appears to have sufficient strength. This might be done by loading it with stone. The load may also be transmitted lower down and the 15in. by 13in. beams stiffened at the same time by adding a straining beam and struts through the centre, as shown in the accompanying sketch. The bolts of the bell frame should be well tightened up.

HENRY ADAMS.

Appointments in South Africa.

EDINBURGH.—A READER writes: "Can you give me any advice as to getting an appointment in South Africa?"

We advise you to wait till the war is over and things are a little more settled in South Africa. At present there is a plentiful supply of labour, but there will no doubt be a boom later; even then, however, you would need to have sufficient money to keep you for six months, if necessary, while searching for a situation, or possess sufficient to enable you to start in practice there as a builder and architect combined. If you have not sufficient money for either or all contingencies you would be foolish to go out without a definite appointment, which might perhaps be obtained by advertising in Cape Town or Pietermaritzburg newspapers.

Forming Mill-Pond Wall.

GALASHIELS.—A. H. writes: "A mill-pond is formed by the natural slope of the ground on three sides, the fourth being an embankment about 75yds. long and 6ft. high. The latter is

never watertight in consequence of rat-holes through it. It is suggested to have a wall of cement-concrete, say, 6in. thick in the centre of the embankment and going, say, 12in. deep below the bottom of the pond, or alternatively a similar wall on the inner face next the pond. Would a wall, say, 9in. thick at the top and 15in. at the bottom be sufficient? Please also say whether a better or less expensive plan could be adopted and prove efficient."

We advise you to build a concrete wall 6in. thick in front of the embankment next the pond and fill in behind it with finely-broken glass to prevent the rats burrowing through. If, however, you decide to build an embankment wall without a clay embankment behind, it should be 2ft. thick at the top, tapering to 4ft. 6in. at the base, but even then if the rats cannot find another outlet they will come through unless you use broken glass in it.

Assistant Surveyor, War Office.

WORKINGTON.—H. H. writes: "To whom should I apply for particulars of the War Office Assistant Surveyorships?"

Chief Surveyor, Royal Engineer, Horse Guards, S.W.

S.K. Building Construction Examination Syllabus.

WEDNESBURY.—H. M. writes: "Which issue

of THE BUILDERS' JOURNAL contained the syllabus of the South Kensington examination in building construction?"

The issue for September 18th, 1901.

Drainage of Burial Ground.

DURHAM.—CASTLE KEEP writes: "Is it necessary in laying-out a new churchyard which will be used for burial purposes to drain the subsoil of it?"

See a reply to an enquiry on the drainage of burial grounds on p. 70 of our issue for March 19th last.

Constant for Steel.

NEWARK.—M. writes: "What is the value of constant c for distributed breaking load in the formula $w = \frac{cad}{l}$ when the joist is steel? I have several books on this subject, but they only give the constant for wrought-iron."

For steel joists and girders increase the value for wrought-iron by one-half.

Planning of Restaurants.

EXON writes: "Kindly recommend a book dealing with the planning of restaurants, arrangements of fittings, &c."

We know of no book on the subject.

Particulars of our Insurance Schemes will be sent on application to the Manager, BUILDERS' JOURNAL, Effingham House, Arundel Street, Strand, W.C.

Bricks and Mortar.

APHORISM FOR THE WEEK.

When one views from without these Gothic cathedrals, these immense structures, that are built so airily, so delicately, so daintily, as transparent as if carved, like Brabant laces made of marble, then only does one realise the might of that art which could achieve a mastery over stone, so that even this stubborn substance should appear spectrally etherealised, and be an exponent of Christian spiritualism. — HEINRICH HEINE ("The Romantic School").

Our Plates.

THE FRAMJEE DINSHAW PETIT PARSEE SANATORIUM, recently erected on Cumballa Hill, Bombay, is a building of exceptional interest as a successful attempt to adapt European ideas of sanitary isolation and proper supervision to the climatic conditions of India and the requirements of native life. Reference to the plan, which is practically the same upon all floors, will show that a large amount of space is devoted to a communication corridor or balcony from which the various rooms open and are lit, a committee-room and doctor's-room being placed on the ground floor only, in commanding positions and entirely isolated. The patients, instead of being located in wards as would probably be the case in Europe, are accommodated by families in small residences, each consisting of sitting-room, bedroom, kitchen, two bathrooms and a properly disconnected w.c., the kitchens being detached from the dwelling-rooms and placed on the far side of verandah-surrounded courtyards, meals being generally partaken of under the shade of the verandah. The dwelling-rooms all have doors and windows both into the front corridor and the back verandah, thus providing a through current of air and ample light free from the glaring sunshine. Externally the treatment would have been more interesting, to an Englishman at any rate, if it had been more oriental in character, the style chosen, that of the German Renaissance work of about fifty years ago, being hardly suitable to Indian surroundings; though in even a large German city it would be considered a satisfactory and even an imposing structure. The architect is Mr. Shapoorjee N. Chandabhoj, of Bombay. The building cost 500,000 rupees, and was opened by his Excellency the Governor of Bombay (Lord Northcote) on January 24th last.—The little chapel of Roslin, bristling with pinnacles, stands on a height beyond Roslin Castle. It was built by Sir William St. Clair, third Earl and Prince of Orkney, as the choir of a larger building designed for the Collegiate Church of St. Matthew. The Earl lavished both wealth and thought on this chapel for the last thirty years of his life, and it is said acted as his own architect. The college was founded in 1450. In respect of the general plan, especially the feature of the central pillars at the east end between the choir and retro-choir, the structure resembles Glasgow Cathedral built a hundred years before. But in the decorative character of the carvings Roslin Chapel has no counterpart; their prolific variety is extraordinary. The "Prentice Pillar," according to a legend, was executed by a youth while his master was absent in Rome, and on his return, becoming jealous, the master killed his prentice.—The illustration of the church at Katwijk is interesting as an example of modern architecture in Holland.

Fires in Old Houses.

MR. S. CHEETHAM, of Rochester, writing to the "Standard" with reference to the recent fire at Euston Hall, says that a few years ago in his own residence smoke was noticed issuing from a crack where no smoke should have been. On investigation it was found that a brick had dropped out of the old central chimney-stack at the point where the flooring of the attic-storey joined the chimney, and allowed the smoke to pass between the flooring and the ceiling of the room below. This had evidently been going on for some time, and if during that time a fire had occurred in the chimney there can be little doubt that there would have been a serious conflagration. Mr. Cheetham suggests that in old houses it may be well to ascertain that the chimneys are sound at

the point where the floors touch them. If the mortar has become unsound, bricks sometimes drop out. He introduced into one of his bedrooms a modern firegrate in which there was no intervening space between the fire and the hearth. The cement-bedding was not sufficiently thick, and in consequence the new grate set fire to the old wooden beam on which it rested. The moral of this is that great care should be taken in fixing new grates in old houses.

The Düsseldorf Exhibition.

A GREAT exhibition of German industry and art will be opened at Düsseldorf, on the Rhine, on May 1st. Throughout the German Empire Düsseldorf is known as the "garden town on the Rhine" on account of its splendid public gardens and its magnificent surroundings. The exhibition will illustrate the development of German industry since 1880. In that year the first exhibition was held at Düsseldorf, and then electricity was represented by a small railway and twelve electric lamps. This year electricity will be everywhere in evidence. The exhibition will cover 150 acres of land, and will be bounded by the Rhine and by the Hofgarten. There will be twenty-five sections, including mining, wood and furniture, fancy goods, clothing, agriculture, building and arts and crafts. The many exhibits will be housed in structures, not uniform in design, but all of some architectural merit. The art gallery will remain standing after the close of the exhibition. The exhibition will remain open until October 20th.

Spirals in Architecture and in Shells.

MR. T. A. COOK in an article in the "Monthly Review" recalls certain suggested resemblances between some of the famous spiral staircases and the spiral curves of certain shells. In the wonderful staircase in the wing of François I.'s Château de Blois in Touraine the curve of the unknown architect's spiral is identical with that of *Voluta resperitilio*. The Scala del Bovolo, in the Palazzo Contarini, Venice, similarly finds for its exquisite rising spiral of light archways a model in Nature in the *Scaloria scalaris*. The Escalier de la Reine Berthe at Chartres exhibits the delicate exterior of the ascending helix of *Mitra papalis*. The spiral in stone may by itself be an artistic failure, as Mr. Cook points out is the case in the stone spirals of the Palais de Justice, Rouen, or the twisted screw spire of Chesterfield.

Richmond Hill View: The Two Bills.

MR. GERALD MAXWELL sets forth very precisely the present condition of the Richmond Hill view problem. He explains that the object of the Richmond Hill (Preservation of View) Bill is diametrically opposed to that of the part of the London County Council (General Powers) Bill which deals with the purchase of the Marble Hill estate. The object of Lord Dysart's Bill is "to settle the lines on which the Dysart estates on the Surrey side of the river may be developed." That is to say, Lord Dysart seeks power to build upon some 200 acres of Lammas land which borders the river on the Surrey side. The object of the London County Council Bill is to prevent a further development of building on the Middlesex side. There can be no question that it is desirable to save the Marble Hill estate from the hand of the speculative builder, and only £10,000 is now required to complete the purchase money. But is it so certain that Lord Dysart's scheme for building on the opposite bank can be made acceptable? Mr. Maxwell continues: "If Lord Dysart wishes to preserve one of the most beautiful landscapes in the whole course of the Thames, he will dedicate to the public that portion of the Lammas fields which lies between the wooded heights of Richmond Park and the Teddington reach of the river. And as this is entirely in the parish of Ham, it would be a direct compensation to the holders of Lammas rights. But the loss of this glorious panorama is by no means all that will follow from the proposed 'development' of the Dysart Surrey estates. Granted permission to enclose the Lammas fields, Lord Dysart may hand over to the builder the entire frontage from Half Mile Point down to Twickenham Ferry. There is nothing at present in the Richmond Hill (Preservation of View) Bill to prevent the building

line from extending round the curve of the river opposite Eel Pie Island; and the fields at this point form a salient feature in the view from the Terrace. To be sure, it is said that Lord Dysart intends to give a wide inward sweep here to the conceded riverside land. But it will have to be a very much wider sweep than that which has been recently staked out if it is to preserve the view intact."

WESTMINSTER ABBEY AND THE OFFICE OF WORKS.

A SIGNIFICANT REMINDER.

IN preparation for the coming Coronation the Office of Works is once more about to be turned loose, as it was in 1887, into the Abbey Church of Westminster," says "E. H. W." in a letter to the "Times." He therefore thinks the moment opportune for invoking aid against a repetition of the kind of wanton havoc which was played in the church fifteen years ago. Three of the grosser outrages then perpetrated deserve to be specified:—

1. On the north side of the sacrum are three magnificent tombs with lofty canopies. They are some of the best specimens of their class in existence, and date from the late thirteenth or early fourteenth century. One of them is the tomb of Aveline, Countess of Lancaster. This figure was shamefully ill-used in 1837, when large fragments were broken off it. Some of these were lying by the side of the effigy when the Abbey was reopened to the public.

2. Abbot Richard de Ware, who was elected in 1258, shortly afterwards visited Rome, where he stayed two years. Thence he brought a quantity of materials, including porphyry, palombino and serpentine for the paving of the sacrum in mosaic. This exceedingly fine example of *Opus Alexandrinum* was constructed by an Italian workman, Odericus, who accompanied the Abbot to England. Obviously, nothing could have been easier than to cover Abbot Ware's interesting pavement with a few planks while the works connected with the 1887 Jubilee were in progress. This simple precaution being neglected, the mosaic was badly smashed in various places, apparently by tools and scaffolding being flung down upon it from a height. The largest and worst of these injuries can be easily traced on the south side, a few feet in front of the portrait of King Richard II.

3. The worst and most wanton piece of vandalism was the treatment accorded to the Coronation Chair. Before 1887 its general colour was that ashy grey so characteristic of very ancient wood, while on various parts of its surface were still to be found traces of its original ornamentation in gilded gesso. In preparation for the Jubilee the chair was smartened up by an ordinary workman with a coat of dark-brown polish—a process which obliterated the remains of the antique decoration, and imparted to the venerable relic a spick-and-span look, reminiscent of Wardour Street rather than of Westminster.

Of minor injuries to the fabric of the church there were many, including a number of chips and scratches (as of hob-nailed boots) plainly visible on the triforium arcading and on the diaper-work of Henry III.'s walls.

"A long and bitter experience of the ways of the Office of Works shows that it is not fit to be trusted with the charge of historic monuments. Is it asking too much to demand that nothing shall be done during the next three months to the fabric or furniture of Westminster Abbey without the consent of the accomplished surveyor to the Dean and Chapter, Mr. Micklethwaite?"

In answer to the foregoing statements Canon Robinson gives the assurance that considerations of convenience and seating accommodation will not be allowed to weigh against the permanent interests of the fabric. "It may be safely said that the interference with the church will be less on this occasion than it has been on any similar occasion in the last two centuries. . . . For many months Lord Esher has been in communication with Mr. Micklethwaite, whose name is, I believe, a sufficient guarantee to all ecclesiastical antiquarians that the interests which they are concerned to defend shall be jealously watched."

IDEAL PLUMBING.—IV.

By G. A. ALLAN, Plumbing Instructor, Trades Training School.

(Continued from p. 92, No. 372.)

THE water-supply of a house is one of the most important matters connected with its habitability; so much so that in the London Public Health (1891) Act one of the "nuisances" rendering a house unfit for human habitation is the absence of the prescribed water fittings.

In towns and places where the water is supplied from main pipes the internal arrangement of the pipes and fittings is all that needs consideration. The pipe conveying the water from the main to the house is called the "service." The part which ascends through the building to the cisterns and draw-off taps is called "the rising main." This latter pipe should be provided with a screw-down stop-cock below the ground level, so as to be beyond the influence of frost, with a draw-off tap just above the ground level for emptying during frosty weather.

All water pipes inside of a building should be fixed on boards attached to internal walls or ceilings, and should be in full view. This is the American custom, and has much to recommend it. In the large cities of the North-west, where the thermometer occasionally registers 62 degs. of frost, there are very few burst pipes for plumbers to repair, nothing like so many in the whole winter as occur in London during one short frost. The fact that water pipes buried in the plaster of external walls provide profitable employment for a large and deserving class of jobbing plumbers appears to be the only reason for perpetuating such an absurd system.

When it can be arranged, the kitchen range should be fixed at one side of the wall between the kitchen and scullery, and the scullery sink at the other side. The wall at the back of the range will not often be so cold as to allow the contents of a pipe fixed against it to freeze even in the most severe winters. The rising main may then be run up behind the sink with a draw-off tap for constant service. This draw-off tap will serve to empty the pipe above it, and by leaving it open when the water is shut off from the house, even if the water remaining in the pipe freezes (which is extremely unlikely at the back of the kitchen range), it is most improbable that the pipe will burst. Of course, the rising main will not be emptied by simply shutting off the water and opening the draw-off tap. Air must be admitted at the top. This is most easily done by running off enough water to allow the ball of the ball-valve to be lowered and so open the valve and admit the air. The rising main supplies the different cisterns. One cistern of galvanized iron should exclusively supply the water for flushing the water-closets and slop-sinks. Another similar cistern should supply the hot-water apparatus. For domestic use, cooking, &c., the cistern should be of white-glazed earthenware. All the cisterns should have wooden covers and be fitted with overflow pipes, the cover of the stoneware cistern being ventilated. Provision should also be made for emptying this cistern, as it should be washed out frequently. The other cisterns need cleaning out occasionally, but not so often.

The cisterns should be placed in an airy, light, well-ventilated room, in which should be some arrangement for warming in winter-time, so as to prevent the frost from damaging the cisterns, or the pipes immediately in connection with them. A screw-down stop-cock should be inserted into each branch of the rising main supplying the cisterns, so that each cistern may be shut off separately for any purpose, without interfering with the others. A similar stop-cock should be fixed near the outgo of each cistern in the down service so as to shut off any service without having either to empty the cistern or to rely on a plug inserted into the outgo inside the cistern. To enable the down service to be emptied when the last mentioned stop-cock is closed and the lowest bib on the service opened, a piece of pipe should be branched into the service below the stop-cock and carried higher than the side of the cistern (see Fig. 18).

By running water pipes only on internal

walls the chances of their being burst by frost are reduced to a minimum, because, even in the severest weather, it is not usual for the temperature of an inhabited house to fall so low as to freeze water in the pipes. By running them on face boards in full view in the kitchen, scullery, bathroom and water-closet the damage done by a burst is very much reduced and the pipe can be repaired and replaced without any "making good" of plaster, paper, paint or tiles. By arranging all the water pipes so that they can be emptied when the water is shut off during the night, or when the house is closed, the chance of damage by frost is reduced to a minimum.

In water fittings, as in the whole of the sanitary arrangements, the simplest are the best. The majority of the ingenious but complicated inventions, mostly designed to remove fancied defects, should be studiously avoided, especially in the country or in any position where skilled labour is not readily available. The fittings though simple should be of the best quality, of heavy brass or gunmetal, by recognised makers who charge a fair rather than a cutting price, and who have reputations they value. The draw-off taps over sinks should be of the ordinary screw down pattern; the supply fittings for the baths and lavatory basins must be adapted to the flushing-rim style of supply.

Lead is the material of which water pipes are constructed in England. In America iron has

FIG. 18.

largely superseded lead for water pipes as well as for soil and waste pipes. Some American writers, as J. C. Bayles, condemn lead in unqualified terms equally for both purposes. Bayles also condemns galvanised iron pipe, preferring the plain black barrel, which he says is the very best material of which to form water pipe, and which will last twenty years before needing to be renewed.

Except in the case of soft water, lead is as good a material as any other of which to form water pipes. In the case of soft water, tin-lined lead pipe and tin-lined iron pipe are useful, also copper pipe; tin being affected very slightly, and copper not at all, by the soft water.

In country houses where there is no public service of water a supply must usually be found in the grounds attached to the premises, and wells or streams are then the most frequent sources from which the water is obtained.

Wells are of two classes, shallow and deep. One writer has explained that all wells less than 50ft. deep are shallow, while wells more than 50ft. deep are deep wells; but in the usual acceptance of the words as applied to wells "shallow" and "deep" have no necessary connection with the number of feet that the surface of the water is below the ground level. Shallow wells are such as yield water which has fallen in the immediate vicinity and has percolated through the earth into the well. Shallow-well water is the ground water lying on the uppermost impervious stratum. Deep-well water is found by digging or boring through the uppermost impervious stratum to the water that is beneath. Artesian wells yield deep-well water though the water will frequently spout into the air.

Speaking generally, shallow-well water is dangerous to use and should be avoided whenever possible. Deep-well water is good. Of course the deep-well water originally fell on the surface of the earth, but it has become thoroughly

filtered and purified before reaching the underside of the clay or rock, which retains what is called the ground water.

Water may be drawn from wells in the old primitive manner by means of a windlass and bucket. It is usual, however, to employ a pump. In deep wells the pump must be of the "lift and force" variety, fixed on a platform 20ft. above the lowest level to which the surface of the water sinks. The pump may be worked by manual labour or by a windmill, or by a steam-, gas-, oil- or hot-air engine.

In the cistern, which will of course be at the top of the building, a float should be attached to one end of a chain; which chain, passing over a pulley, has at its other end a weight hanging in front of a scale, the scale being as long as the cistern is deep. When the cistern is quite empty the weight will be at the top of the scale; when the cistern is full, the float having risen as the cistern filled, the weight will be at the bottom of the scale; when the cistern is partly full the position of the weight in front of the scale will indicate how much water the cistern contains.

When the pump is worked by manual power it will be better to have cisterns on different floors of the building, as it will then be unnecessary to pump water to the top of the house which is to be used cold in the scullery, dairy, laundry or stables. The windmill is a cheap and efficient motor for pumping in most situations, though when placed too near the building the appearance of many houses and institutions has been spoiled by it. All the attention that the windmill needs is to be put in or out of action, as water is or is not wanted and as there is wind; and to be kept very carefully oiled. A steam-engine is not suitable for pumping when power is not wanted for any other purpose. When an engine is required for the general work of the establishment it may appropriately do the pumping also, but to have to light a fire and get up steam only to pump would, under most conditions, be a waste of energy. Where gas is available, either from the public mains or from a private installation, a gas-engine is the best motor that can be used. It can be started at a minute's notice with a minimum of trouble; and as soon as the pumping is done the engine is stopped and the consumption of gas at once ceases. It can easily be arranged that when the cistern becomes full the counterweight shall shut off the gas and so automatically stop the engine. Where gas is not to be had, an oil- or hot-air engine will be best. These, like the gas- or steam-engine, or the windmill, can also be used for other work. But when the total amount of work to be done will keep an engine at work all day the steam-engine will be found most economical.

If the source of water-supply be a stream instead of a well the water will generally need to be filtered before being used, though it is usual to pump it first. From a stream, as from a well, the water may be pumped by means of a windmill or by a steam-, gas-, oil- or hot-air engine. If there is a sufficient fall in the stream there is also the chance of raising the water by means of a hydraulic ram, or of working the pump by means of a turbine or water-wheel.

If the water be potable as taken from the stream, and there is sufficient fall—10ft. is preferable—a hydraulic ram will give good results and needs practically no attention. A large overflow pipe discharging into the eaves-gutter will allow the escape of surplus water when the cistern is full. If the water as taken from the stream is not potable, but needs to be filtered, one or more filter-beds can be formed near the stream and the filtered water forced up to the house cistern by a pump worked by a turbine or water-wheel actuated by the stream.

In some cases a pipe is led from a stream at a higher elevation than the house supplied, and the cistern filled by gravitation; or the cistern may be omitted and the house supplied on the constant system.

Where there is an abundance of indifferent water and a small supply of water of good quality, the latter can be used exclusively for drinking and cooking, and the former for washing, cleaning, flushing and general domestic purposes.

Rainwater, in cities, is turned into the sewers. The roofs of the buildings are so foul that the water would be useless without filtration, and the amount of soot and dirt is so great that the

filters would soon be clogged. In the country the roofs are not so foul, most of the filth being birds' droppings. By arranging the rainwater stack pipes so that there shall be as few of them as possible, and attaching to each a Roberts' patent rainwater separator, the first rain which falls washes the roofs and runs to waste, while the balance is stored for use. A very large butt is sometimes fixed outside the scullery or laundry on a stand of the necessary height, with a pipe leading through the wall fitted with a tap over the sink. Occasionally a brick tank is built above ground and rendered inside with cement. But the best way of storing rainwater is in an underground cistern built of brick set in cement compo, of circular form, the bottom being paved with flagstones and the top being built bottle-shaped. The whole of the bottom and sides should be backed with well-puddled clay. In constructing it, the ground is excavated to a depth of 2ft. deeper than the inside of the tank is to be, and 18in. of well-puddled clay is laid over the whole of the bottom. The excavation should be 4ft. more in diameter than the inside of the completed tank. This allows a 9in. wall, with 18in. of puddled clay behind it all the way up. On the puddled clay first laid in the ground two layers of flagstones breaking joint should be laid to form the bottom of the tank. The wall should not be built up at any place more than 1ft. higher than any other place, and the puddle backing to the wall should be put in in layers of not more than 1ft. thickness. Each layer must be well worked into the layer previously laid. This work requires particular care, because if there is a defect the brick wall prevents it being reached and rectified. A pump is fixed near the sink with the suction-pipe leading to the bottom of the cistern and terminating about 6in. from the floor. By this means neither scum nor sediment can be drawn into the pump.

These underground cisterns are beyond the reach of frost, and keep the water cool in summer. They should be well protected at the manhole made for gaining access to the interior, and they should be cleaned out annually, at the time of year when the water in the cistern is lowest, so as to waste as little as possible.

When it is considered desirable to filter all the water supplied to a house, hotel or institution, sand is the best filtering material to use. When the water is taken from a stream the filter-beds can be formed on one side and the water filtered before it is pumped as previously explained. When only the drinking water is to be filtered a Pastur filter for screwing on to a tap should be used. There are only three efficient filters made. They are all of the candle type. They consist of cylinders of unglazed earthenware through the pores of which the water is forced by pressure. The earthenware is specially prepared. This is the only form of filter that retained all the germs of typhoid fever from some specially-infected water which was experimented with. The ordinary type of filter depending for its action on charcoal or chemical substances has been proved to be not only useless but harmful. For though it purifies water to a large extent while new, before it has been in use for any length of time it imparts more organisms to the water than it intercepts, and it is not certain to intercept the specific germs of disease even when new.

Closely associated with the question of water-supply, but not usually connected with plumbing, is the provision of hydrants for the connection of fire-hose in large houses, &c. Though less urgently required in towns where there is a good municipal fire brigade, these are eminently desirable in all positions, and are absolutely essential in the country. A large cistern in a tower, or just under the roof, should be kept exclusively for fire-extinguishing purposes. From this should descend one or more main pipes, generally down the stair wells, with branches where necessary along the passages, corridors and galleries. With a hydrant on each floor on the staircases, and enough hose connected to reach into the centre of any room near, the house will be well protected against fire. It will be no use, however, to fix a complete fire apparatus unless the inmates of the building are trained in its use. This should be frequently done both at set drills and on false alarms. And

twice a year, when the house is being cleaned, all the hydrants, valves, hose, couplings, unions, &c., should be overhauled by an expert.

The main supply to the hydrants should be kept away from all external walls and cold positions and carefully wrapped in many thicknesses of felt, as this is a pipe which cannot be emptied in frosty weather. The pipes and hydrants may be cased in the staircases; and it will not be beyond the ability of architects to work the treatment of the casings of the pipes into the general scheme of decoration in the building.

(To be concluded.)

DEFECTS IN THE "MODEL" BY-LAWS.

THE Incorporated Association of Municipal and County Engineers recently held a meeting at Birmingham, when a paper on "The Filtration of River Water" was read by Mr. A. J. Jenkins, deputy-borough surveyor, Burton-on-Trent, and another on "Local Government Building By-laws" by Mr. F. C. Cook, engineer and surveyor, Hinckley.

Mr. Cook devoted the first part of his paper to a consideration of the "model" by-laws, and while agreeing that some such guide to local authorities was necessary, deprecated the hard-and-fast rules which seemed to govern the officials at the Local Government Board in dealing with suggested deviations from them on the part of local authorities. He criticised the "all or none" attitude of the Local Government Board, pointing out, for instance, that though if a local authority desired to make by-laws as to the height of rooms the Local Government Board would assuredly insist upon their model clause being entirely adhered to, yet they appeared to have no objection to the matter being left practically unregulated. It could not, he said, be denied that the general effect of the adoption of by-laws based on the model code had been to considerably raise the standard of building throughout the country, but it was questionable whether, in the case of the smaller towns, they did not unnecessarily retard building operations to their detriment, and in the larger towns the increased cost of building, added to the high price of land, rendered almost prohibitive the ideal of one family occupying one house, and resulted in the overcrowding which was such a blot upon the sanitary condition of some of our large cities. Amplification or modification of by-laws could be secured by a private Act of Parliament, but, unless an Omnibus Bill were in contemplation, that was obviously beyond the power of, at any rate, the smaller districts. Moreover if the by-laws issued by the Local Government Board were to be regarded as a "model" series it should not be possible to get behind them by a private Act, and if modifications and amplifications so obtained were fit and proper powers for a local authority to enjoy, they should be within the reach of every town without the trouble and expense of promoting a private Bill. Mr. Cook suggested three main lines of reform:—A leveling-up by the compulsory adoption of modern by-laws in districts at present behind the times in this respect; the formulation of a code of model by-laws confined to those points which experience has shown to be essential; and the empowering of local authorities to make supplementary by-laws and regulations, specifying what may be regarded as matters of detail, and containing provisions specially suitable for the needs of different localities.

Mr. John Price, who contributed to the ensuing discussion, said that probably no town in the United Kingdom had worse by-laws with regard to ventilation at the rear of buildings than Birmingham, but they were endeavouring to overcome the difficulties in the Omnibus Bill.—Mr. Henry Price, the city building surveyor, mentioned that at the present time Birmingham was, with regard to open spaces at the rear of buildings, acting under the by-laws of 1876, and consequently had no power to compel the provision of any open space at the rear of a good-sized villa. He remarked that the Local Government Board had latterly been making much greater concessions than ever before,

New Patents.

These patents are open to opposition until May 19th.

1931.—Shaping Tool for Door Stiles.—3,048. A. J. NORRIS, 63, Mildmay Grove, London, S.E. The tool is mitre-shaped and has cutters on the head and base as well as on the periphery. It is attached to a rotary spindle and is specially intended for forming the shoulders of door stiles.

Non-Conducting and Anti-Corrosion Composition.—5,374. W. BRIGGS, 13, Panmure Street, Dundee. This composition consists of bitumen or pitch, 50 per cent; lime or whiting, 20 per cent.; fine sand or Portland cement, 20 per cent.; and flake mica, 10 per cent. These ingredients are melted in an iron cauldron and mixed well together.

Lime and Cement Kilns.—6,623. I. ISSERLIS, 12, Rostionnaja, Kieff, Russia. In order to combine all the advantages of the generator kiln and that of the Hoffmann furnace, and avoiding their disadvantages, two parallel longitudinal walls and two parallel rows of generator or gas hearths are arranged in immediate connection with the shaft.

Cement Manufacture.—6,800. G. W. BUTCHARD, Burch House, Rosherville; A. A. BUTCHARD and J. A. BUTCHARD, both of Ellerslie, Gravesend; and H. GIBSON, 9, Great St. Helen's, London, E.C. The slurry is kept in a round tank fitted with a special form of mixing and stirring apparatus, this consisting of a number of depending rakes fixed to revolving horizontal arms: the object being to prevent the slurry settling and so keep it ready for use. The upper part of the rotary kiln is reduced in diameter by the insertion of a tubular lining, so that the downward motion of the slurry is slow at first and its drying rapid. To prevent choking, the mouth of the pipe through which the slurry is pumped into the kiln is made conical instead of cylindrical.

Blast-Furnace Slag Cement.—10,857. A. M. CLARK, 53, Chancery Lane, London (communicated by Fellner & Ziegler, Machine Works, Kreuznacherstrasse, Bockenheim, Frankfurt-on-the-Main). The molten slag is fed on to a rapidly revolving cone or plate, where it is dispersed by centrifugal force and finely divided so that its particles are brought into contact with sufficient air to cause the complete combustion of all deleterious elements, such as sulphides, &c.

1902.—Water-Closet Seats.—2,396. M. J. ADAMS, 72, Park Lane, Leeds. The seat is made of wood but has the "soiling portions"—those which are more readily contaminated by the user—made of porcelain, earthenware or similar material.

The following specifications were published on Thursday last, and are open to opposition until May 26th. A summary of the more important of them will be given next week. The names in italics are those of the communicators of the inventions.

1901.—5,556, BROOKES & BARNES, kilns. 5,799, BRITISH CHARRIER WOOD CARVING CO., LTD. (*Charrier*), wood-carving machines. 6,167, CHATWOOD, locks for safes and strong rooms. 6,742, BEAUMONT, door locks. 6,982, MORTON & BRADSHAW, apparatus for removing or recovering fusible matter adhering to stones, blocks, &c. 7,102, BUTT & STREADER, vehicles for carrying timber. 7,447, GREENHILL, vertical bar metallic fencing. 7,472, WILLIAMS, pipe T's and elbows. 7,512 Osgood, taps. 7,814, LOSS, roofing tiles. 7,815, LOSS, roofing tiles. 8,433, LE MAITRE, window sashes, casements, &c. 8,575, HARGREAVES, door knobs. 8,619, WATROUS, water-closet valves. 8,767, DOULTON, water-closet fittings for connecting supply pipe to basin. 8,894, GOLBY (*Hass*), self-closing valves. 9,544, LUTHER, metal sash-frames for windows. 9,662, FRANCKE, double doors. 9,742, ASHWORTH, bricks. 10,021, BEAUMONT, coin-freed locks for lavatories. 10,388, SANER, corrugated metal flooring. 10,417, OBENLAND, hand planes. 10,622, TIMOFEEFF, pavements. 10,865, LONES, HOLDEN & LONES, manufacture of white pigment from zinc. 11,231, HALBACH, stocks and dies. 16,127, SEYMOUR & LOWENTHAL, sheet-metal frames. 21,806, GRIFFITHS, cranes.

22,884, HUXLEY, valves. 24,683, BERRY & JOHN BENNET LAWES & CO., LTD., cements or plasters and manufacture of bricks, tiles, &c. 25,177, FOSS & LINCOLN, valves. 25,261, WHALLEY, rainwater troughing for buildings. 26,066, PEARMAN, door-fasteners.

1902.—178, RANSOME, means for coupling metal bars in re-enforced concrete buildings. 307, COMSTOCK, window-sash fastenings. 1,489, BIRCH, drains.

Keystones.

Mr. Ernest Runtz has returned from Ceylon greatly benefited by the trip.

Mr. Henry Price has been appointed architect to the Manchester Corporation.

Architectural Copyright.—The law of artistic copyright in France has now been extended to include architectural works.

A Memorial Window to the late Mrs. Colston and her son has been erected in the parish church of St. James, Southbroom, Devizes.

In St. Olave's Church a new chancel screen has been erected to the memory of the late Mrs. Ingle, wife of a former rector of the church, and her sister. The work has been done by Messrs. Harry Hems & Sons.

Devon and Exeter Architectural Society.—A meeting of this Society was held last week, when Mr. Arthur S. Parker, A.R.I.B.A., read a paper on the building by-laws of Plymouth, our report of which we are obliged to hold over till next week.

Mr. Charles Kirk, of Sleaford, died recently. He was the surviving partner of the firm of Kirk & Parry—now merged in Kirk, Knight & Co.—builders and contractors, of Sleaford. Before the day of county councils the deceased held the post of surveyor for Kesteven.

Institute of Journalists' New Building.—The foundation-stone of the new hall being erected for the Institute of Journalists at the corner of Bridewell Place, in Tudor Street, E.C., was laid last Saturday, Mr. Henry L. Florence, F.R.I.B.A., is the architect, and Mr. J. Carmichael is the builder.

The New Public Baths at Walham Green, which have been erected by the Fulham Borough Council from the designs of Mr. H. Dighton Pearson at a cost of about £620,000, were opened last week. The establishment includes three swimming baths, eighty-four private baths, and a washhouse containing stalls for sixty-six washers.

An Iberian Temple Discovered.—Dr. Sieglin, Professor of Ancient History at the University of Berlin, has discovered during his recent tour in Southern Spain what is probably the oldest temple of the ancient Iberians, at the confluence of the rivers Odiel and Rio Tinto, near Huelva. The temple was dedicated to the Goddess of the Lower World, and is connected with two caves which are filled with debris.

Building Trades' Gift to the Nation.—Sir Theodore Martin states in the "Times" that he visited the Bisley houses on March 28th and found several large buildings which had been completed for many months, but without furniture, and the whole place utterly deserted. There was, however, a board stating the title of the homes and the address of the Soldiers' and Sailors' Help Society, to whom he now addresses several pertinent questions as to the future of the buildings.

Sheffield Society of Architects and Surveyors.—The annual meeting of this Society was held last Thursday, when the annual report was received. Reference was made in it to the action taken by the Society in regard to the new by-laws which the Highway Committee of the Sheffield Corporation had prepared for submission to the Local Government Board, and the Council hope that their recommendations will result in a workable set of by-laws being adopted. After the report had been approved the officers for the ensuing session were elected, Mr. P. Marshall, F.S.I., being elected president. The Society's prizes for measured drawings were presented to Mr. G. R. Morris and Mr. D. B. Jenkinson. The statement of accounts shows a balance in hand of £64.

New Poor Law Offices at Birkenhead are being erected from plans by Mr. Edmund Kirby, architect. The contractor is Mr. W. H. Forde, and the clerk of works is Mr. W. Hughes.

The School of Art Woodcarving, South Kensington, has been reopened in rooms in the new building of the Royal School of Art Needlework in Exhibition Road. Some of the free studentships are vacant and application may be made for them.

Goethe Statue for Rome.—Professor Gustav Eberlein, sculptor, has prepared his model of the Goethe statue, which the German Emperor has signified his intention of presenting to the city of Rome. A Corinthian capital serves as pedestal to the poet's statue, the plinth being decorated with three groups symbolising Goethe as dramatist, poet and philosopher.

A Large Hotel for New York.—Another great hotel is to be added to New York's already imposing list. Mr. John Jacob Astor proposes to erect, at a cost of £1,000,000, a great structure in the Upper Broadway district. It will closely resemble the Hotel Cecil, but will be somewhat less lofty and without a courtyard. A roof garden is included in the design.

A New Board School at Gatshead has been erected in Victoria Road for 300 scholars. The new school is a one-storey building (intended for children in the lower standards) consisting of six classrooms and a large central hall. Mr. W. H. Dunn was the architect, and Mr. Thomas Hunter, of Washington, the contractor. Mr. Thomas Rule did the plastering, Mr. Charles Nicholson the slating, and Messrs. Allinson & Son the plumbing. The hot-water apparatus was supplied by Messrs. Richardson & Co., of Darlington.

Stratton Audley Church has been restored at a cost of £1,000. The building has been put in thorough order by Messrs. T. Grimsley & Son, Bicester; the bells having been re-hung by Messrs. Webb, of Kidlington. The chancel roof has been taken off and a new parapet built, the interior having undergone a course of re-decoration and a new floor provided. New pinnacles have been added to the tower, whilst a lightning conductor has been fitted to ensure safety. The parapet walls have also been thoroughly repaired.

Truro Cathedral is about to be enriched by a fine example of Tinworth's bas-relief work in terra-cotta. The artist, who was first brought into note by Sir Henry Doulton, of the Lambeth potteries, executed a work 8ft. 5in. long by 3ft. 2in. in height called "The Way of the Cross," and the owner, Mr. Frank Walter Bond, of Wargrave Park, Berkshire, who is of Cornish descent, has presented it to the Cathedral of Truro. It contains about sixty figures, and is one of the best examples of Tinworth's handicraft. "The Way of the Cross" will probably be placed in a prominent position near the west end of the nave.

A Cottage Hospital at Kilsyth has been erected. It is built of red-pressed bricks, slated with green slates, and capped at the ridges with red tiles. The front gables are filled in with half-timbering, with the recessed part between them roofed over and formed into a verandah, with pillars and broad arches above and wood-railing below. The contractors were:—Masonry, Mr. William Reid, Larbert; joinery, Mr. John Peter, Kirkintilloch; slating, Mr. D. McNair, Falkirk; plasterwork, Messrs. J. & A. Williamson, Kilsyth and Kirkintilloch; and plumbing, Messrs. W. T. Forrester, Stenhousemuir. The architects were Messrs. M'Luckie & Walker, of Stirling.

The Eastbourne Technical Institute.—Mr. P. A. Robson, whose plans for the proposed Technical Institute at Eastbourne were adopted, has written to the Technical Committee stating that he is prepared to obtain a builder's tender for £25,000, to include all fees and both buildings (the Institute and the fire station), or for £20,000 with 10 per cent. margin. It will be remembered that the lowest tender was £34,000, and as this was nearly double what was originally estimated the scheme was defeated by an overwhelming majority. It was anticipated that the scheme would have to be completely re-modelled, and the architect's offer opens another way. He stipulates that he should be allowed to employ his own quantity surveyors.

A Coronation Exhibition is to be held shortly by Messrs. Doulton at their Lambeth works; a Tinworth Room will be a prominent feature.

In St. Lawrence Parish Church, Ramsgate, a stained-glass east window has been erected as a memorial to Queen Victoria, who as a girl worshipped there. The window is from a design by Mr. A. O. Hemming.

The Plans of Mr. J. M. H. Gladwell, architect, of Boston House, New Broad Street, E.C., have been accepted for the alterations to be carried on at the Buckfield Hotel, Snaresbrook. He will also be responsible for alterations and additions to the Victoria House, Burdett Road.

Copies of "Builders' Journal" Wanted.—The publisher will be glad to send a copy of the current issue of THE ARCHITECTURAL REVIEW in exchange for a copy of THE BUILDERS' JOURNAL for March 14th, 1902, or for March 21st, 1900.

Memorials at Shere.—A stained-glass memorial east window and a memorial lych-gate at the old church of St. James, Shere, have been dedicated. The glass is the work of Mr. James Powell, of Whitefriars, and the lych-gate is of local construction, after the design and erected under the superintendence of Mr. Lutyens.

A New Nurses' Home at Aston has been erected at Gravelly Hill in connection with the workhouse. Messrs. C. Whitwell & Son, of Birmingham, were the architects, and Mr. T. Johnson, of Great Brook Street, was the builder. The cost has been about £9,900. It occupies a position facing Feltham Road, to the south of the infirmary buildings. Accommodation is provided for upwards of forty nurses.

New Municipal Offices at Craws.—The Crewe Corporation, being unable to accept the London and North-Western Railway Company's price of £1 per yd. for land near the Market Square as a site for the new municipal offices, have decided to pull down their present suite of offices and the Market Tavern alongside and erect municipal buildings on their own freehold at a cost of about £12,000.

A New Board School in Devonport has been erected in Trelawney Avenue to accommodate 900 scholars. Messrs. Hine & Odgers, of Plymouth, were the architects. The cost is about £11,000. Mr. W. Blake was the builder, and Mr. G. Sleeman acted as clerk of works. Baylis's system of ventilation has been used throughout the building, which is warmed on the high-pressure system, the apparatus being fitted by Messrs. Longbottom, of Leeds. The walls outside are faced with select local red bricks, and the roof is covered with Delabole slates.

A New Fire Station at Glastonbury has been erected at a cost of about £1,200 in George Close, and comprises a large engine-house, secretary's office, stabling for two horses, yard for drilling and other purposes, store sheds and sanitary offices. But the feature of the building is a tower 40ft. high, specially built for drying the hose. The base of the tower is heated with hot-water pipes, which are also extended into the engine-house, in order to keep the men's clothes aired and dry. A roomy and conveniently-arranged house is built on to the station for a caretaker. The whole block has been built, under the supervision of the borough surveyor, by Mr. D. Dunthorne, contractor.

Surveying and Sanitary Notes.

The Estate of the late T. J. Fife, surveyor, formerly of Whittington Avenue, Leadenhall Street, has been valued at £10,139 9s. 4d.

Brisco Estate, Hastings.—The Hastings Corporation have decided to purchase for £18,000 about 9½ acres of the Brisco Estate. The land is in the centre of the town, and is considered a suitable site for a winter garden and recreation ground or for new municipal buildings.

New Public Park for Manchester.—The Heaton Park estate has been bought by the Corporation of Manchester for £230,000. It comprises an important family mansion, standing in the centre of the park, which has an area of about 650 acres, entirely surrounded by a brick wall.

Engineering Notes.

Widening of London Bridge.—On Thursday last the construction of the temporary timber foot ways on each side of the bridge was begun.

A Proposed Mono-Rail to Brighton.—It is stated that Mr. Behr, the inventor of the mono-rail and the original promoter of the Manchester and Liverpool Electric Express Railway, which received Parliamentary sanction last session, has been commissioned by an influential syndicate to prepare plans for a new electric railway from London to Brighton.

Windsor and Maidenhead Light Railway.—An enquiry was held recently with reference to the proposed light railway between Windsor and Maidenhead. The scheme was supported by some of the residents and strongly opposed by landowners and others in the district. Sir Alexander Binnie detailed the varying widths of the roadway along which the railway would pass

from Windsor through Clewer, Dedworth and Holyport to Maidenhead. The Commissioners under the Light Railways Act at the close of the investigation said they considered that the case for the promoters had not been sufficiently proved, and they accordingly refused to grant the order.

The Institution of Civil Engineers held a meeting on April 8th, Mr. Charles Hawksley, president, in the chair, when it was reported that the Council had recently transferred eleven Associate Members to the class of Members, viz.: J. H. Barker, G. J. Bell, G. F. Burn, J. Ferguson, F. D. Fox, M.A., A. P. Friend, W. Kingston, B.E., C. Mayne, G. T. Nicholson, J. H. Rider and E. G. Rivers. The monthly ballot resulted in the election of fifty-two Associate Members, viz.: J. E. Acfield (Leeds), A. H. Alcock (Leeds), A. M. Arter, (London), W. L. Atkinson (London), W. A. A. Battle (Leeds), G. R. Blackburn (Baildon, Yorks), C. R. D. Borrett (London), H. Brodhurst (London), W. E. Bush (Birmingham), W. Carnegie (London) J. D. Cormack (London),

G. H. Corringham (Leeds), E. McLeod Dowson (Cairo), F. A. Drought (Southampton), J. W. S. Emerson (London), A. R. Gibbs (London), W. J. Gow (London), J. E. Greig (London), J. W. Griffith (Rosslare), W. J. Guyatt (Glasgow), W. H. Haigh (Cardiff), H. T. Hildage (London), R. F. Hindmarsh (Newcastle-on-Tyne), B. Howdle (Seacombe), B. Humprey (New Swindon), W. Hutchison (Glasgow), J. Irvine (Leeds), G. Jerram (London), H. Lapworth (Sheffield), C. E. Lloyd (London), J. T. Maxwell (East Indian Railway), A. Millar (London), W. M. Moylan (London), C. F. Murphy (Bolton), J. J. Niven (Edinburgh), J. S. Owens (London), F. C. R. Palmer (London), G. Porter (Worthing), W. W. Preece (London), J. D. Prophet (Cuba, W.I.), A. C. Rogerson (Horwich), C. E. H. Salmon (W. Africa), W. C. Shettle (London), R. C. Sikes (Great Western Railway), H. L. Smith (London), F. C. Taylor (Manchester), W. A. Thain (Cardiff), G. Ward (Birmingham), W. Watts (Penistone), J. B. Willis (Ilford), J. F. Wilson (Cape Colony), F. Wright (Malta).

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
April 17	London, S.E.—Works	St. Olave's Union Guardians	Newman & Newman, 31 Tooley Street, S.E.
" 17	Silsden, Yorks—Six Houses	Co-operative Society, Ltd.	R. Holdsworth, Secretary, Society's Offices, Silsden.
" 17	Salford—Stones for Headstones, &c.	—	Borough Engineer, Town Hall, Salford.
" 17	Portadown, Ireland—Parochial Hall	—	J. W. Walby, Architect, Portadown.
" 17	Sutton Scotney, Hants—Pair of Cottages	—	W. & G. A. Bell, Architects, Andover.
" 17	Ilkerton—Car Shed, Offices, &c.	Tramway and Electricity Committee	Borough Surveyor, Town Hall, Ilkerton.
" 17	Bunham-on-Crouch—Additions to Schools	School Board	Chancellor & Son, Architects, Odinstford.
" 18	St. Anthony's Point, nr. Falmouth—Coastguard Bldgs.	Admiralty	Director of Works Dept., Admiralty, 21 Northumberland Av., W.O.
" 18	Dewesbury—Branch Store, &c.	Pioneer's Industrial Society, Ltd.	Holton & Fox, Architects, Corporation Street, Dewsbury.
" 18	Hull—Car Shed	Corporation	A. E. White, City Engineer, Town Hall, Hull.
" 18	Ilkley—Masonry, &c.	Urban District Council	Surveyor, Council Offices, Ilkley.
" 18	Stainton, near Dalton-in-Furness—Church and School	—	J. W. Dickson, 2 Fair View, Dalton-in-Furness.
" 19	Gateshead—Hall	—	A. L. Armour, 16 West Street, Gateshead.
" 19	Glenbucklet, Aberdeen—Farm Offices, House	—	Jenkins & Marr, 16 Bridge Street, Aberdeen.
" 19	Haverfordwest—Water Closet, &c.	Union Guardians	D. E. Thomas, Architect, Victoria Place, Haverfordwest.
" 19	Lancaster—Alterations to Cottage and Farm Buildings	Streets Committee	Borough Surveyor, Lancaster.
" 19	Landore, near Swansea—Church	Rev. D. W. Morgan	E. M. Bruce-Vaughan, Architect, Cardiff.
" 19	Londonderry—House	J. Alexander	J. McIntyre, Architect, Letterkenny.
" 19	Ruilham, Great Yarmouth—Chapel	—	A. S. Hewitt, Architect, Bank Chambers, Regent St., Gt. Yarmouth.
" 19	Surbiton—Boundary Walls	Urban District Council	Surveyor, Council Offices, Surbiton.
" 19	Gelligaer, Wales—Repairs, &c., to Schools	School Board	James & Morgan, Architects, Charles Street Chambers, Cardiff.
" 19	York—Church Restoration	—	Boreham & Morton, 24 John Street, Sunderland.
" 19	Kendal—Two Shops, Billiard Room, &c.	Stretford Urban District Council	J. Bintley, 7 Lowther Street, Kendal.
" 19	Old Trafford, Manchester—Public Baths	—	E. Woodhouse, Architect, 88 Mosley Street, Manchester.
" 19	Edgeworthstown, Co. Longford—Convent Schools	Redruth Brewery Co., Ltd.	T. F. McNamara, 50 Dawson Street, Dublin.
" 19	Par Station—Additions, &c., to Hotel	—	H. W. Collins, Architect, "Waledredon," Redruth.
" 21	Bristol—Hall and Classrooms	Great Northern Railway Co. (Ireland)	Oatley & Lawrence, Edinburgh Chambers, Baldwin Street, Bristol.
" 21	Dublin—Houses	—	Company's Engineer-in-Chief, Dublin.
" 21	Wardhouse, Scotland—House	School Board	A. Taylor, Overseer, Wardhouse.
" 21	Gloucester—Infants' School	Hornsey Urban District Council	H. Medland, 15 Clarence Street, Gloucester.
" 21	London, N.—Firemen's Quarters & Fire-Escape Shed	Hammersmith Guardians	E. J. Lovegrove, Offices, Southwood Lane, Highgate, N.

Sept 1-14	St. Petersburg—Bridges over Great Neva River	—	St. Petersburg Gorodskaja Uprawa, St. Petersburg.

Builders' Notes.

Mr. Frederick Adkins, senior partner in the firm of Messrs. Adkins Brothers, builders, of Victoria Road, Surbiton, died recently.

Messrs. G. B. Kent & Sons, Ltd., of 75, Farringdon Road, E.C., have just issued a new sundry catalogue of thirty-two pages.

The New Stour Valley Brickworks of Messrs. S. Barnett & Sons, Tipton, were formally opened last week. They are situated at Dudley Port. The new plant is capable of turning out 50,000 bricks per day. Mr. James Shenton, M.I.C.E., was the engineer of the works.

A Gladstone Statue.—Shoremaster Boddie, Aberdeen, has received the order for the massive granite pedestal for the statue of the late Mr. Gladstone, by the sculptor, Mr. W. Hamo Thornycroft, R.A., which is to be erected in George Square, Glasgow. The pedestal is to be of fine axed white Kemnay granite, and will weigh about 44 tons.

The Granite used in London Bridge.—The exterior of London Bridge is constructed of three sorts of granite. The eastern side is of the purplish Aberdeen granite; the western side, of the light-grey Haytor granite from the Haytor quarries, which lie adjacent to the famous Hay Tor rock, near Bovey Tracey; and the voussoirs on both sides are of both sorts and an admixture of the red-brown granite of Peterhead. The fillings-in are of Bramley Fall, Derby and Whitby stone.

Brick- and Tile-Making in Rhodesia.—Messrs. Taylor, Jarvis & Short, of Salisbury, Rhodesia, have now started brick- and tile-making, and recently took delivery of about 55 tons of brick- and tile-making machinery supplied about three years ago by Messrs. Robey & Co., Ltd., and Messrs. J. Whitehead & Co., Ltd., which had lain for 2½ years at Beira. As testimony to the expert packing which English firms of repute adopt, despite its long sojourn on the coast the plant was found to be in as good condition as when it left the makers' workshops. There is a large demand for good bricks in South Africa, and this is particularly the case at Bulawayo and in adjacent districts. The new engine equipment of the Bulawayo Electric Lighting Works was also supplied by Messrs. Robey & Co., Ltd.

British Fire Prevention Committee.—The Executive announces that Mr. Ellis Marsland, district surveyor of Camberwell, has consented to act as hon. secretary, thus supporting Mr. Edwin O. Sachs, the chairman, particularly in respect to the testing work, which has grown far beyond what was originally anticipated. Mr. Marsland, who has been closely associated with the committee from its outset, is this year Master of the Worshipful Company of Tilers and Bricklayers. The working Executive has also been strengthened by the following additional members:—Mr. J. W. Sheppard, North British and Mercantile Insurance Company; Mr. Langridge, A.M.I.E.E., Royal Insurance Company; and Mr. Hamilton, A.R.I.B.A., district surveyor for North Fulham. As to the testing arrangements of the committee for the coming session, tests are being arranged with another heavy warehouse floor, with roofing by the Vulcanite Co., Ltd., with glass by the Union Plate Glass Co., Ltd., who wish to have their wired glass compared with the glazing of the Luxfer Prism Co., and Messrs. Pilkington, whose materials have already been under investigation.

New Companies.

Manchester Geographical Society Building Co., Ltd.

Registered to adopt a certain agreement, to acquire land near Manchester, and to erect any buildings thereon; other objects as indicated by the title. Capital £10,000 in £10 shares. The first directors are E. W. Greg, H. Nuttall, E. W. Mellor, A. A. G. Tulloch, G. Oppenheim and E. Sowerbutts.

An Architectural Causerie.

Mr. Bodley and Mr. Shaw. IT has now been officially announced that Mr. G. F. Bodley, R.A., and Mr. R. Norman Shaw, R.A., have accepted the invitation of the Liverpool Cathedral Committee to act as their architectural advisers in the preliminary selection of architects and in the ultimate selection of a design for the Liverpool Cathedral. This will undoubtedly meet with approval in all quarters. A better choice could not have been made. It satisfies both parties, for while Mr. Bodley, as an earnest advocate of Gothic and the designer of many beautiful churches, will satisfy those who flock to Mr. Robert Gladstone's banner, the other party will rest assured that the influence of Mr. Norman Shaw, as the leading architect in this country, will counteract any undue preponderance for the one particular style. It is interesting to note the views which these two men hold in regard to the matter. Mr. Bodley believes Gothic, at its best, to be the most beautiful and most poetical architecture that the world has ever seen. He says: "If I compare the interior of Westminster with St. Paul's, my greater praise and deliberate choice is for the supreme beauty of the Abbey. . . . Nor does Westminster stand alone for the expression of refined grandeur." In saying this Mr. Bodley endorses the opinion of Coleridge, who wrote: "When I enter a great classical church such as St. Peter's at Rome, or St. Paul's, London, I feel how great is Man; but when I enter Westminster Abbey or other great Gothic churches I feel how small is Man." Mr. Norman Shaw, on the other hand, considered that the restriction of the style of Liverpool Cathedral to Gothic was "simply deplorable," and, moreover, he strongly objected to any form of competition being held, favouring instead the selection of an architect of proved ability (proved by actual work executed), to whom a perfectly free hand should be given: and in support of his contention he cited the late Mr. Bentley and his magnificent design at Westminster—"It is like a revelation after the feeble Gothic stuff on which we have been mainly fed for the last half-century." Bentley was a devoted "Gothic man" for about forty years, but, says Mr. Shaw, "when he was confronted with this great work he threw off his Gothic shackles, and made an entirely new capture, feeling, I have little doubt, that he could do better in another manner." It is thus pretty evident how divergent are the two men's views; yet it were well; and if only the Committee will behave themselves and not treat Mr. Bodley and Mr. Shaw as puppets we shall doubtless obtain the best selection that can be made from the designs which are to be submitted

by the end of next month.—Whilst referring to Mr. Bodley, it is perhaps opportune to note that a dinner was recently given to him by his past and present pupils and assistants to celebrate the somewhat tardy honour awarded him by the Royal Academy. Professor F. M. Simpson, one of the earliest pupils, occupied the chair. In the course of the evening a large silver salver was presented to Mr. Bodley as a memorial of the occasion. The salver, which has been admirably made by Messrs. Widdowson & Veale bears on the face Mr. Bodley's coat-of-arms, and on the back the following inscription written by the President of Magdalen College, Oxford:—

GEORGIO . FREDERICO . BODLEY
ACADEMIE . REGLE . NUPER . ASCRIPTO.
VIRO . OMNIBUS . MUSIS . AMICO.

conscience; a kind of courtesy to architectural demands; and that at heart the Council either did not believe in, or have sufficient taste to care for, a uniform treatment.

Truro Cathedral. THE report of Sir Thomas Drew on the fractured bases of the piers in Truro Cathedral has now been published in full. A summary will be found on p. 151. Sir Thomas ascribes the cause to the mortar being so finely ground and scientifically mixed that the piers became practically monoliths, "with the attendant risk of undistributed pressure all coming on a single bed, and that under the plinth. . . . The modern mortar was too prompt in its setting quality and too thin to allow of the automatic adjustment that is afforded by a thick swimming bed of old mortar." He also thinks the weights were too soon imposed on the substructure. The wrought stones were bedded out to the face and the joints pointed-up as the work rose. This is a practical method with suitable mortar rightly handled; but tight bedding was adopted at Truro. The occurrence draws attention once more to the general misunderstanding of the function of bedding. Sir Thomas considers the bases should be restored, and states he would not take the responsibility of advising inaction; yet, in spite of this warning, the Committee have decided not to remedy the damage, presumably on the recommendation of the architect, Mr. F. L. Pearson, and the

DRAWING-ROOM. ALBERT E. DIXON, A.R.I.B.A., ARCHITECT.

The Council's Competition.

QUITE recently the London County Council put up a large black board at the corner of Wych Street showing a plan of the crescent end of the new street to Holborn and announcing that three extensive building plots at the eastern end of the island portion would be offered at Tokenhouse Yard on June 17th. Opposite, on the corner of the crescent, Carr's new restaurant and offices is to be built according to Mr. Walter Emden's designs, while at the other end of the island the new Gaiety Theatre and Restaurant, and Short's new premises, are being rapidly erected from Mr. Runtz's designs (largely altered by Mr. Norman Shaw). In October, 1900, there was a brave show of the schemes formulated by the eight architects whom the Council selected, and to whom they paid £2,000 for their trouble. And these two facts do not tally. Everything goes to indicate that the Council have abandoned the idea of a homogeneous treatment of these blocks of buildings, though the opportunity was the finest ever given them. If this proves to be true, the spending of £2,000 on a competition was a pure waste, and would only confirm the belief in many minds that this was simply a weak concession to their municipal

contractor, Mr. Willock, who were present at the meeting. This is a grave mistake.

The Persistent Problem.

PEOPLE are always disputing about "restoration," and doubtless Mr. Caröe's method before the Architectural Association will not be accepted in all quarters. Mr. Caröe was particularly insistent on the modern architect "effacing" himself when called upon to make additions to any old building, but personally we cannot altogether agree with this view. It is considered perfectly proper for Early English additions to be made to a Norman building or for a Perpendicular window to be inserted in a Decorated church, yet nowadays we are told to abhor such ways, and to swallow up our own work in what can never be more than a mimicry of the old. With Mr. Selwyn Image, we consider that when a new window has to be inserted in an ancient church it shall be the best that the artist is able to produce after his own device. It is true that individual instances may be cited where most unpleasant, even disastrous, results have followed by such a practice being adopted; but the principle itself is nevertheless much nearer the truth than the other.

STABLES TO HOUSES, NORTH HILL ROAD, HEADINGLEY, LEEDS.
ALBERT E. DIXON, A.R.I.B.A., ARCHITECT.

MODERN LIGHTHOUSE CONSTRUCTION.

By G. DRYSDALE SWEETMAN.

AT a recent meeting of the Institution of Junior Engineers Mr. G. Drysdale Sweetman, of Ryde, gave some "Notes on Modern Lighthouse Construction."

To illustrate the evolution of structural design the four erections on the Eddystone were briefly described, and their chief points of difference indicated as follows:—The base of Winstanley's tower (1695) was built of stone, strengthened with iron bands; its sides were vertical, and were encumbered with a profusion of unnecessary and even dangerously obstructive ornament. It was in the form of an octagon 100ft. high, and was destroyed by a storm in 1703. Rudyerd's tower (1705) was built of wood ballasted with stone. Its plan was circular and the unwieldy ornament was omitted. In section it was a frustrum of a cone, 23ft. in diameter at the base and 14ft. at the top, and about 67ft. high. The foundation rock was levelled off in steps and the tower united to it by means of bolts keyed into the rock. It was destroyed by fire in 1755. Smeaton's historic structure was finished in 1759. The material was stone, and for external form the trunk of an oak tree was chosen. The base was thus considerably broadened and the waist narrowed in comparison with Rudyerd's tower. The masonry was bonded together and into the rock by an elaborate system of dove-tailing. It was 76½ft. high, and was partially removed in 1882 owing to the concussive erosion of the bed-rock, which threatened its stability. Douglas's new Eddystone was built of granite and differed from the last-named in having a cylindrical base with vertical sides carried 2½ft. above high-water mark. The tower, which was a concave elliptic frustrum, started from the top of this vertical plinth. The total height from foundation to vane was 170ft. The walls were 8ft. 6in. thick at the base and 2ft. 3in. at the top. The tower was solid to a height of 25ft. 6in. above high water.

In some experiments on wave power made at the Skerryvore and at the Bell Rock by Thomas Stevenson forces as great as 6,083lbs. per ft. at the former and 3,013lbs. at the latter station had been recorded; with these stupendous forces to combat it behoved the designer to appreciate every minute detail of the disturbing elements and to endeavour to neutralise their action. By spreading out the base not only was a broader foundation area obtained and the centre of gravity lowered, but also the force centre of

each wave stroke was raised by the momentum of its impact and a portion of its violence dissipated in overcoming the force of gravity. There was a limit, however, to this base-spreading policy, set by the tendency of the wave crests and spray to rise so as to obscure the lantern, and it was partly to obviate this difficulty that the late Sir James Douglas designed the new Eddystone with a cylindrical base.

The generally accepted shape for a lighthouse in plan was circular, but the suggestion was offered that with a polygonal plan of many sides but little more obstruction would be made to the waves, and instead of swirling round as in the case of a circular tower the waves would be made to take a rather divergent course, and so offer a lee-side for landing purposes. The foundation courses should in all cases be sunk below the surface of the rock, for, though the stability of the structure depended for the most part on its weight and the low position of its centre of gravity, the idea was to make the tower virtually a projection of the rock itself. It was important that the pressure of all the materials and structural units within the tower acted vertically, so as not to produce a resolved force operating laterally as an outward thrust. Care should be taken to so locate the openings in the tower as to afford them the greatest protection. It was interesting to note that the presence of seaweed was of great advantage in breaking the force of waves. The internal accommodation usually comprised the service-room, which contained the lantern, attendants' room, bedroom, general stores, oil stores or (as the case may be) gas store, dynamo-room, &c. A water tank low down in the base and a crane were also necessary.

The author in referring to materials of construction pointed out that although skeleton towers were often easier to erect than masonry ones, owing to the difficulty of devising a safe landing-stage during rough weather, and also to the impossibility of fixing any floor below the highest probable wave crest, accommodation was greatly hampered if a very high tower were not otherwise necessary. For masonry structures, the granites, syenites and porphyries

were the most useful stones. In some situations the use of concrete has much to recommend it, and if only the difficulties of cracking could be obviated there was no doubt but that the material would be more largely used. Besides the popular theory of expansion and contraction, the possibility of some sudden chemical change in the later portions of the setting process producing a disruptive molecular disturbance, or perhaps of the mass being in itself in such a state of initial tension or compression that it was sensitive to ætherial or seismic tremors which would not affect a more resilient material, were advanced to account for the cracking of mass concrete.

In conclusion the author dealt with the optical arrangements of lighthouses.

CHESTER CATHEDRAL.

THE RESTORED SOUTH TRANSEPT.

THE Chester Archaeological Society recently inspected the restored south transept of Chester Cathedral, now almost completed. Before the visitors proceeded to examine the various parts a paper was read by Archdeacon Barber, in which, after the history of the transept had been related, he described in order the various stages of the restoration or reparation of this transept after £1,000 granted by the Ecclesiastical Commissioners had been expended in 1880 in the repairs of external work. The first thing undertaken was the groining of the eastern aisle. Having explained the representations on the various carved bosses, the Archdeacon passed on to the year 1887, when the mean tracery was removed from the great south window and replaced by that of the late Sir Arthur Blomfield. In 1889 the eastern aisle was refloored, the divisions between its several chapels indicated, and the sedilia and piscina in St. Nicholas' Chapel restored. Other windows designed by Mr. Kempe were added as memorials. Coming to the restoration now approaching completion, Archdeacon Barber, after explaining its inception as a memorial to the late Duke of Westminster, said the columns and walls had been cleared of numerous coats of whitewash, thus disclosing the original stone. Extensive repair was necessary not only at the bases, but also in other portions of the piers. The vaulting of the roofs had been carried out for the first time. All the bosses were designed by Mr. Blomfield in conjunction with Messrs. Thompson, whose carvers executed them under the guidance of Mr. Fincher, who carved the bulk of the figures himself. Some idea might be formed of the extent of the work from the fact that the stones out of which the larger bosses were carved weighed three-quarters of

a ton. Turning to the central portion the Archdeacon said they could not but admire the general effect of the groining, and again commend the wisdom of Sir Gilbert Scott and his successors in adopting this mode of treatment. The colour of the stone was such that the two materials blended together in perfect harmony.

PHOTOGRAPHY AS APPLIED TO ARCHITECTURAL MEASUREMENT AND SURVEYING.*

By J. BRIDGES LEE, M.A.

MOST people are in the habit of looking upon photographs as more or less artistic or inartistic pictures destined to convey impressions more or less accurate or inaccurate of what things look like. Comparatively few people have yet acquired a habit of regarding photographs as accurate measureable records of external facts.

The first important generalisation we can arrive at is that the picture surface can only be an exact copy of the thing depicted when that also is a similar surface, and only then when the picture surface was parallel to the object surface at the time when the picture was taken. We may conveniently regard a photographic picture as a radiant production every point of which is at the end of a straight line coming from an apical point somewhere in front of the picture. Generally that point is somewhere inside the body of the lens, but it may be outside, either before or behind the lens, and it is called the station-point. The picture yielded by the lens is the same as would be obtained by a simple pin-hole at the station-point; a good lens gives a brighter and more sharply-defined picture than a pin-hole, but otherwise the pictures are the same in size and outline.

With this conception always in mind that a photographic picture is a collection of points at the ends of straight lines radiating from the station-point in the same directions as corresponding straight rays of light which have originally travelled from the objects depicted to that point or its adjacent counterpart, a correct understanding of many of the problems of photographic geometry becomes simple and easy. It becomes clear at once that when the true position of a picture is known with reference to its station-point any number of direction lines from the station to points on the objects depicted can be ascertained with ease, because they will be the same as the direction lines from the station to the corresponding points on the picture. To fix the actual positions of the object points it is sufficient to know their several directions from a known point and the distances of those points along the direction lines. Generally it is not convenient or easy to determine directly the distance of a point along a radius of direction. The most convenient and best way for general purposes is to find the horizontal distance first, then the altitude, when the actual line or distance will be the hypotenuse of the right-angle triangle of which the horizontal distance and altitude are the sides containing the right angle. To find the horizontal distance a method of intersection similar to the plane table method of land surveying is used. Photographs of the same objects are taken from different stations. The direction rays to any point whose position is required are observed and projected on a ground plan, when the intersection of the projected rays will mark the position of the point on the ground plan. The altitude can then be ascertained by determining from the picture the angle of elevation and computing the height which would subtend the observed angle at the distance already ascertained on the ground plan. Also the altitude will be a fourth proportional to three lengths, which can be measured directly. These are (1) the distance from the station to the projection of the image point on the horizontal trace of the picture plane. (2) The horizontal distance of the point from the station measured in scale feet on the plan. (3) The measured height of the image of the point on the picture above or below the horizon.

Or it may be determined by substituting values in a general formula $h = d \tan \alpha$, where h is the altitude above or below the station, d is linear horizontal distance, α is the angle of elevation observed from the station and \tan , and is $\frac{y}{\sqrt{f^2 + x^2}}$, where f is focal distance and x and y are abscissae measured from the centre on the

horizon and principal vertical lines as rectangular co-ordinates.

In practice there are no considerable difficulties provided we have enough accurate information about the pictures which are used.

The methods so far considered and explained in outline relate only to the fixing of points on a ground plan by the methods of intersections and of elevation by the particular methods described. These methods are almost universally applicable, and with moderate care they yield very accurate results with much less expenditure of time, money and effort than would be needed for an ordinary survey of the same ground with a plane table or any of the other known methods of surveying. In Canada this method has been largely used, and it has been found that the actual money-saving from using the photographic method was then two-thirds of the computed cost of a plane table survey. A similar saving has been computed as the result of using this method for the survey of the Trans-Baikal Railway in Siberia; and it seems reasonable to believe that with the improved instrumental appliances of the present time, and others perhaps to follow, the saving of expense for surveys hereafter will be from 80 to 90 or perhaps even 95 per cent. of the cost of similar surveys in the past by old-fashioned methods.

When dealing with buildings it is often

up the camera perfectly square in both instances, the images of the vertical hair on the face of the building will include between them a slice exactly as broad as the measured distance between the two camera stations.

One way to investigate flat surface areas is to apply what is known as the method of squares. If we imagine a plane area to be entirely made up of small squares, then the position of any point in the area is sufficiently determined if it is known in which square it is located and what is its position in the square. When dealing with a front view it is sufficient to superpose on the picture a sheet of glass on which has been ruled or photographed a network of regular squares in elevation. If the focal distance of the picture be known, it is a very simple matter to compute the scale value of the squares for different distances of the object surface.

Next in order of simplicity of measurement to a simple frontal view of a plane surface will be a horizontal surface or plan. For practical work regular series of perspective squares may be engraved or photographed on flat sheets of glass to make what are called perspectometers, which can be laid in position on the photographs with the scale surface next the picture face. These perspectometers need to be specially constructed with precise reference to the focal length of the lens in each case.

HALL IN HOUSE, NORTH HILL ROAD, HEADINGLEY, LEEDS.
ALBERT E. DIXON, A.R.I.B.A., ARCHITECT.

possible for the photographer, without difficulty or much loss of time, to measure directly with a tape the perpendicular distance from the diaphragm of his lens to the wall of the building to be photographed. This distance can be noted on the picture. The scale can then be calculated and constructed in a few minutes, and all distances on the surface elevation can be measured directly with a pair of compasses and that scale.

Distances on parallel surfaces nearer or further away, such as projections, porches, deep-set windows or other recesses, will require different scales of measurement according to their distances in advance of or behind the principal surface, or the same scale can be used for measurement and the results divided or multiplied by a constant computed for the difference. Another way to get the scale is to place a rod of known length in close contact with the surface where its image will be entirely included in the photograph.

Sometimes it is not convenient to walk up to a building to measure the distance to it or to place a measured length against it. A very efficient plan then is to shift the camera a measured distance to the right or left parallel to the face of the building, and take a second picture, when, if due care has been taken to set

The method of squares which has been spoken of as applicable to the measurement and plotting of elevations and plans can be applied also for the measurement of other receding flat surfaces, such as the roofs or walls of buildings.

Sooner or later the time will come when photographic projection will be systematically employed for teaching perspective, and it will be employed practically, on a large scale, for projecting images from one plane to another. We must not expect to obtain full knowledge of unknown objects of three dimensions by aid of a single photograph, or even a number of photographs from a single point of view. To study unknown objects thoroughly we need to be able to examine them from several different points of view and to compare the views. The use of photography does not obliterate this necessity, though it helps very decidedly towards correct final conclusions, because it records faithfully the appearance observed at every station, and these views from different stations can be brought close together and directly compared.

[Note.—A paper by Mr. Bridges Lee on "The Geometric Interpretation of Photographs as applied to Surveying and Other Purposes," with illustrations, was published in THE BUILDERS' JOURNAL for January 15th last.]

* Summary of a paper read before the Society of Arts on April 16th, 1902.

GROUND PLAN.

FIRST-FLOOR PLAN.

HOUSES, NORTH HILL ROAD, HEADINGLEY, LEEDS. ALBERT E. DIXON, A.R.I.B.A., ARCHITECT.

Engineering Notes.

The City of Sheffield Smallpox Hospital has been supplied with Shorland's double-fronted patent Manchester stoves in glazed faience, and patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

Buckingham Palace Lake. Various improvements have been made in the grounds of Buckingham Palace. The ornamental lake in particular has been extensively altered. It was a large basin with a total depth of about 7ft. from the lowest point to high-water mark, and had sides sloping outwards at a very sharp angle. The appearance of the water at its edge was consequently most deceptive, and the lake might well have been found dangerous. As a much shallower depth would be ample for ornamental purposes and equally effective for boating, about 3ft. of the basin have been razed off and the surrounding lawns treated in proportion. The fountain in the centre has been removed.

For the Purpose of Supplying Water to Derby, Leicester and Nottingham, and the counties from which these great towns take their name, the Derwent Valley Water Board are "tapping" the dales of Derbyshire and constructing a series of gigantic reservoirs which it is computed will hold about ten thousand million gallons of water when completed. This great enterprise is being carried out by an association of local authorities forming the Board. Of the five reservoirs decided upon, two will be constructed above Derwent Hall, two in the Ashop Valley and one near Bamford. Each reservoir will be two miles in length, and the construction of the railway, which is a necessary preliminary to the work, is nearing completion. The construction of the first great dam is now in its initial stages. The colossal character of the undertaking may be realised from the fact that the watershed extends a distance of about forty miles, and that twenty years will probably elapse before all is finished. The engineer for the scheme is Mr. Edward Sandeman, who designed the great Plymouth reservoir at Dartmoor. The Derwent Valley Board are themselves carrying out the work under Mr. Sandeman's supervision.

The Institution of Mechanical Engineers held its annual dinner last Thursday at the Hotel Cecil, the president, Mr. William H. Maw, occupying the chair. Lord George Hamilton, in response to a toast, said it was his desire that all orders in connection with Indian railways should be placed within the limits of the British Empire. During the last two or three years certain orders had gone abroad because the British manufacturers had not been able to comply with the time limit that it had been necessary to impose.

At his request a conference had been held at Calcutta, at which the representatives of the leading Indian railways had been present, to discuss the important question of standardization. He believed that if a satisfactory conclusion could be arrived at on this subject one of the main obstacles which now prevented the locomotive factories of this country from complying with requirements in times of emergency would be to a large extent mitigated. The Japanese Minister, Viscount Hayashi, observed that in the early part of the last century the Emperor of Japan, thinking it most important to develop the material resources of his country and to educate his people in the sciences, applied for the assistance of engineers and professors in this country. The progress that had been made in these matters by Japan was owing a great deal to the advice of gentlemen connected with the Institution of Mechanical Engineers and with kindred institutions.—At a meeting on Friday last Mr. Robert E. Atkinson read a paper on "The Standardization of Pipe Flanges and Flange Fittings."

DISAPPEARING EDINBURGH.

OLD Edinburgh is rapidly disappearing. Year by year ancient buildings vanish; soon all will have gone, and from High Street everything venerable from its historic or traditional associations will have passed away. Time was when the close packed and high-piled alleys demanded a thinning out in the interests of sanitation and of decent living. That time, however, is long gone, and now the question is not what must needs be demolished, but what can and ought to be preserved. A group of antique buildings, of more than common interest and value, is being swept away even now. These tenements, situated between Bailie Fyfe's and Morrison's Closes, are unusually good examples of old Scottish domestic architecture. On the street elevation some of the fronts have been modernised, but in the rear the features of a former age are striking and conspicuous. In Bailie Fyfe's Close the group terminates to the north in a lofty tower-like structure, gabled and crow-stepped. Adjoining it a picturesque combination of dormers and chimney stacks leads up, at the end next the High Street, to a tall staircase with two beautifully-moulded doorways, one giving access to a large hall a few steps higher than the ground floor, the other leading to the upper storeys. A bold string-course above the two doorways unites and harmonises the composition. A little to the north of the two doorways just described a low-browed, cellar-like opening gives access to a vaulted

passage leading in the direction of Morrison's Close, whither we shall now proceed. Passing down Morrison's Close from the High Street, we come at once to another common stair, enclosed in a lofty square tower rising above the level of the Close to a height of seven storeys, and giving access to an imposing structure united on the west to other buildings equally striking, which extend as far as North Gray's Close. These houses, viewed from the close, are, or rather were, of a most stately and picturesque character, amply realising all that has been said by Daniel De Foe, Taylor, the water poet, and other visitors of former days, in praise of the great edifices of stone which adorned the ancient capital. Returning to our stair-tower we find a succession of short flights of easily-graded steps carried by a centre wall which, on each landing, terminates in a half-column with finely-chiselled capitals and bases. Each step carries a bold moulding on all three edges, and the whole aspect is rich and effective. Proceeding down the Close we come to what is now an open yard, formed by the back of the buildings in High Street and Bailie Fyfe's Close. From this yard the buildings to the north and west have been removed some time ago. The vacant space reveals the fact that the entire group has rested on vaulted basements of stone, solid and massive as those of an ancient castle. Access to these buildings, which had enclosed a small and almost secret quadrangle measuring about 20ft. by 12ft., was obtained by the low-browed and cellar-like door already described in Bailie Fyfe's Close.

Inside the quadrangle at the north-west angle, and on the level of the first floor, appeared a deeply-recessed Latin cross about 3ft. 6in. in height. Nothing further could be made out from beneath, but an ascent to the first floor opened on a large hall about 39ft. by 15ft., at an inner angle of which, within the longer limb of the Latin cross, was found a narrow lattice window of leaded glass—one of the rarest things of its kind in old Edinburgh. About the middle of this hall, on the west side, was a tall mullioned Gothic window. It was flanked on the north by a magnificent fireplace, with bold mouldings and clustered columns which sustained a massive monolith lintel about 8ft. by 2ft. The stones forming the fireplace are now heaped together in the yard. All that remains of this remarkable group of buildings is now in process of demolition. In its place we are to have a number of new erections, the frontage to the High Street to be built of stone, but the buildings behind are to be simply brick tenements of the usual shoddy type, as destitute of human interest as of architectural quality.—(Extracts from an article in the "Scotsman.")

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication

Fountain Court, Hampton Court Palace.

LONDON, S.W.—G. A. H. writes: "Where could I obtain working drawings of Fountain Court, Hampton Court Palace, suitable for making a perspective drawing?"

Two plans and an elevation, made by Mr. Alfred Cox, A.R.I.B.A., in 1888, are to be consulted at the Library of the Royal Institute of British Architects, 9, Conduit Street, W., while two elevations by Mr. P. L. Marks were published in the "Builder" for March 24th, 1888. G. A. T. M.

New Police- and Fire-Brigade Stations.

WEST HARTLEPOOL.—H. B. writes: "Kindly mention the best police- and fire-brigade stations that have been recently erected."

In London a new police station (the largest of its kind in the Metropolitan district) has been built in Cannon Row, New Scotland Yard, from the designs of Mr. J. Dixon Butler, and a small police-station by the same architect has been built in Hyde Park in place of the old one that did service for so many years; a new station for the Metropolitan Fire Brigade has been erected at a cost of £12,000 in West End Lane, Hampstead, from the designs of Mr. W. E. Riley; a new fire-station has been built in the Euston Road at a cost of £21,000; another at Islington; and another at East Greenwich (this being at the junction of Horn Lane and Tunnel Avenue with Lower Woolwich Road—cost £13,100). In the provinces a very large fire- and police-station is being erected at Manchester from the competition designs of Messrs. Woodhouse & Willoughby (estimated cost, £110,000); new police courts and sessions house are to be built at Blackburn; a new police- and fire-brigade station has been built at Cambridge (see our issue for November 13th, 1901); a new central police-station is being built for the city of Hull (see our issue for September 11th, 1901); a new fire-station is to be erected in Westgate Street, Cardiff, from the plans of the borough engineer, Mr. Harper (estimated cost, £15,250); a new town hall and police-station has been built at Ilford at a cost of £30,000; a new fire station at Stockport (£12,000); and a new central fire-station has been erected at Scarborough.

Obtaining Faculty to Church Alterations.

STROOD.—A. CAMPANILE writes: "How does one obtain a faculty for building a heating chamber and vestry to a church, and also for executing needful repairs, including filling-up graves (if any), laying 6in. concrete and wood block (or tile) floor? Please state to whom one must apply, whether detailed specifications and drawings are necessary, and any other particulars."

I believe that application has in the first instance to be made to the bishop of the diocese, though the faculty would eventually be granted by the Dean of Guild Court. A full description, together with drawings, specification and estimate from a responsible contractor should accompany the application. G. A. T. M.

Colours to Withstand Exposure.

READING.—B. A. F. writes: "Kindly recommend what to use to get this colour (vermilion) and also a light wash of crimson lake on an ordnance sheet, which will last exposed to slight damp and the strongest sunlight. I have tried Higgins's vermilion waterproof ink, but this faded in about three weeks in the weak sunlight which we have had lately."

Try the colours made by Mr. A. G. Thornton, St. Mary's Parsonage, Deansgate, Manchester.

Questions of House Tenancy.

LONDON, W.—A. H. writes: "(1) When must the key be given up to terminate a tenancy? Supposing some premises had been vacated, but the keys were omitted to be surrendered, could

the landlord claim rent afterwards? (2) If the tenant's fixtures are left on the premises after possession has been given up, because they were not worth removing, can the landlord claim a dilapidation for their removal or for the making good afterwards? (3) If an agreement has been signed, and stamped, to rent premises for the remainder of out-going tenant's term, namely, nine months, with a clause inserted to the effect that the tenant has the option at the end of the term to continue occupation for a further term of three years, how long does it hold good? Is it necessary at the end of the first term to have fresh agreement?"

(1) If notice has been given to terminate the tenancy of any dwelling-house, and the rent has been paid according to the terms of hiring, the key should at once be given up unless you have terms of acquittance signed by the owner or his agent; otherwise you may be liable for any and every accumulation of rent, even if you have given notice, unless you have taken the receipt and acquittance which is required by law. (2) Tenants' fixtures cannot be removed after possession has been given up; neither can the landlord claim dilapidation for them if they were taken by you from the previous tenant, and left by him with the consent of the landlord. All new fixtures erected by yourself the landlord can, unless erected with his consent, compel you to take away and make good any damage caused by removal. (3) If the agreement has been properly signed and stamped, with the landlord's signature attached, it will be necessary to get the lease renewed, at or before the expiration of six months, for a new term of agreement.

J. E. BRAND.

Iron Doors in Party Walls.

PORTSMOUTH.—STUDENT writes: "Kindly answer the following question set at a recent examination: 'Draw plan and section of double iron party-wall doors, hung folding, with iron rebated frames, in an opening 3ft. wide by 7ft. high, between two warehouses.'"

Iron doors would not usually be hung folding in an opening only 3ft. wide. By the London Building Act of 1894 an opening shall not be made in any party wall or in two external walls dividing buildings which if taken together would extend to more than 250,000 cub. ft., except under the following conditions: (a) Such opening shall not exceed in width 7ft., or in height 8ft., and such opening or openings taken together shall not exceed one-half the length of such party wall on each floor of the building in which they occur; (b) such opening shall have the floor, jambs and head formed of brick, stone or iron, and be closed by two wrought-iron doors, each $\frac{1}{2}$ in. thick in the panel, at a distance from each other of the full thickness of the wall, fitted to rebated frames without woodwork of any kind, or by wrought-iron sliding doors or shutters, properly constructed, fitted into grooved or rebated iron frames; (c) if the thickness of the wall be not less than 24in., or the doors be placed at a distance from each other of not less than 24in., such opening may be 9ft. 6in. in height. The accompanying illustration shows the required answer to the question.

HENRY ADAMS.

Design for Roof-Truss.

WELLINGBOROUGH.—BASS FLUTE writes: "I send rough section through small schoolroom

IRON DOORS IN PARTY WALLS.

(not reproduced). Is the construction safe, or should iron king and tie rods be used? The principals are 9ft. apart."

The construction shown will be safer if it has 1½ in. by ½ in. stirrups at the three points where the laminated rib touches the collar beam and principal rafters, with bolt ends screwed ½ in. and with a 2 in. by ½ in. plate across the top to take the nuts. There should also be a 1½ in. by ½ in. strap round the bottom ends of the rib, which may be bolted through the wall piece, but it would be better made as a stirrup with the bolt ends carried through the wall and nuts on the outside.

HENRY ADAMS.

Making Perspective of Asylum Buildings.

OXFORD.—PERSPECTIVE writes: "I am about to make a perspective of a large block of asylum buildings and I want to show them as seen from an elevated standpoint. What should be the height to show buildings about 1,000ft. to the rear of front block; and what should be the distance in front of the picture-plane in order to avoid a distorted appearance?"

The accompanying plan shows what in my opinion are likely to prove the best positions for picture-plane and "eye," the latter being located about 250ft. above ground and 350ft. in advance of the picture-plane. It is, however, very much indeed a matter of taste, and local

circumstances may render a view in parallel perspective more suitable, such as would be obtained by locating the eye where shown on the sketch supplied with query. G. A. T. M.

Strength of Roof-Trusses.

NORTHAMPTON.—PARISH ROOM writes: "I cannot find formulæ or diagrams to enable me to find out authoritatively the scantlings for the roofs shown on the enclosed sketches (not reproduced). Are the scantlings as figured sufficient?"

There are no formulæ or diagrams applicable to the trusses shown on your tracing. The lean-to shed roof should have a cleat on the post under the tie-beam (unless the latter is let in on each side), and an angle brace or curved bracket should be fixed between the post and the tie-beam. The wall end of the truss should have a stone template under the tie-beam. The posts should be protected from wet lodging against the foot and from other damage by a splayed and mitred skirting 7 in. high; the bed upon which it rests should also be weathered. The scantlings shown for this roof are very light, but appear to be safe. The connection of the parts of the roof-truss for the upper hall is not quite clear. The principal rafters must not be less than 9 in. by 3 in., the collar beam and angle filling-pieces being of the same size; the latter, forming the curve, must be bolted through to the principal rafters and collar beam by bolts not less than 3 ft. apart; the pitch-pine facing will then come outside all these timbers. The wall should be 1½ bricks thick at the very least, or should have substantial piers at each truss, say, not less than 18 in. by 9 in.

HENRY ADAMS.

Quantities in Contracts.

IPSWICH.—QUANTITY writes: "(1) 'The bills of quantities will form the basis of the contract. The contractor is to furnish the architect with a priced copy, and all variations will be valued in accordance with these prices.' Does this clause

make the quantities part of the contract, and can the contractor claim for any omissions or errors in them? (2) Please recommend a simple book on single and double entry book-keeping for builders."

(1) The clause makes the quantities part of the contract and the contractor can claim for omissions or errors in them, and likewise reductions can be made if the errors are in favour of the contractor. (2) We cannot recommend any of the books on book-keeping for builders.

Architects' Certificates.

CARDIFF.—ENQUIRER writes: "I send you a copy of an architect's certificate and should be glad to know the proper way to fill it in (1) when granting a certificate on account of work done under a contract; (2) when granting a certificate for extras on a contract; (3) when granting a certificate for full amount of contract and extras, keeping only the usual retention money in hand for a stated time; (4) when granting a final certificate which includes all retention money kept back and remaining amount, if any, of the contract amount and extras."

The form of certificate you send is hardly adequate enough; it should be larger, so as to allow more particulars to be given. (1) State the sum, name of job, nature of work and the number of the instalment. (2) State the sum, with words "on account of extras to"; then follow with name of job. (3) State sum, "on account of works completed at (name of job) making in all — per cent. of the total value of the works, inclusive of extras value — on the amount of the contract and leaving a balance due to him (contractor) from you (client) of £ —, that is — per cent. of the total value of the works, pending the issue of my final balance certificate." (4) Add words "being the final balance due to you from (name of client) in settlement of all claims you have against him and relieving you from all further liability under the agreement made (date of builder's agreement)."

Assistant Architect and Surveyor, Office of H.M. Works.

B. J. writes: "Kindly state how to obtain an official nomination for this examination, also the range of knowledge required for the various subjects. Papers (of nomination examinations) previously set are not published."

Applications for official nomination should in the first instance be addressed to the Chief Surveyor, H.M. Office of Works, Storey's Gate, S.W. Such nominations, however, are rarely given to any who are not temporarily employed in the department and of whose capabilities the "Chief" has knowledge. As a rule the first step is consequently to obtain temporary employment as a draughtsman. The range of the examination has not materially altered from what it used to be when the appointments were open to public competition; while there is no "standard" of knowledge which ensures success. As a rule three candidates, all capable men, are nominated for each vacancy. Those who score most marks, provided they reach a comparatively low grade of efficiency (as almost all succeed in doing), secure the vacant posts. The requisite standard for success therefore depends upon the mark-obtaining abilities of the other competitors, and as this may on any occasion be exceptionally high it is impossible to be too well prepared for an examination, especially as seniority for promotion ranks in order of merit.

G. A. T. M.

Concrete Piers.

LIVERPOOL.—HAZELWOOD writes: "What is the safe load per ft. super. for concrete piers? Would 15 tons per ft. super. be the maximum for a pier 4 ft. square and 30 ft. high? What is the best proportion of materials for the above class of work? May 6 to 1 be taken as perfectly satisfactory?"

The load on a pier 4 ft. by 4 ft., 30 ft. high, should not be more than 10 tons per ft. super.; the safe load we advise is 8 tons on a pier composed of 3 parts of broken brick to 1 of cement: 6 to 1 is unsatisfactory in a pier, though reasonable in foundations. If 6 to 1 were the proportion, the safe load would be 4 tons per ft. super.

New Patents.

These patents are open to opposition until May 26th.

1901.—Wood-Carving Machines.—5,799. THE BRITISH CHARRIER WOOD CARVING CO., LTD., 49, St. Mary Axe, London, E.C. (communicated by L. C. H. Charrier, Vendome, Loir et Cher, France). This is an improvement on the machine described in specification No. 25,003 of 1894. A reciprocating beam is provided to carry a number of independently-working tools and pressers in combination with a movable part of the frame below the work for actuating other tools.

Removing Pitch, &c., from Stones, &c.—6,982. W. MORTON, 33, Elizabeth Street, and J. H. BRADSHAW, 62, Dale Street; both of Liverpool. This invention more especially relates to the removal and recovery of pitch from paving setts of torn-up roads. The apparatus consists of an oven mounted on wheels and having an endless screen travelling throughout its length. The setts are placed on this screen, the pitch is melted off as they pass through the oven, and the cleaned stones are discharged at the other end.

Tile Manufacture.—7,814. R. LOSS, 34, Kronenstrasse, Hanover, Germany. Completely-finished tiles are made in one operation from a strip of clay forced out of the pug mill. The clay passes between a pair of moulds carrying rollers—the moulds in each roller being half the depth of the tile—and is thus pressed into shape and cut off. Nibs are also formed automatically.

Bricks.—9,742. J. ASHWORTH, Middle Beck-side House, Dalton-in-Furness. The brick is made with a depending overlap covering the joint and so preventing the entrance of moisture.

Rainwater Troughing.—25,261. W. WHALLEY, 354, Colne Road, Burnley. The troughing is of salt-glazed earthenware in short lengths made integral with the wall plate and jointed with cement. In a modification, the wall plates are dispensed with and holdfasts used for supporting the troughing.

The following specifications were published on Thursday last, and are open to opposition until June 3rd. A summary of the more important of them will be given next week. The names in italics are those of the communicators of the inventions

1901.—5,681, DEVILLE, lifting jacks. 6,479, ROBB, combination instrument for taking bevells, measuring angles, &c. 7,122, YOUNG, fireproof and soundproof floors, partitions, &c. 7,269, BOUSFIELD, top-running rails for sliding doors. 7,276, HUMPHREYS & READ, apparatus for opening and closing gates, doors, &c. 7,762, TAILBY, saw benches. 7,827, DEFRIES & FEENEY, binges. 8,118, BOYLE, downcast ventilators. 8,169, RODNEY, locks or latches. 8,184, HARRICH, system of construction with beton strengthened by metal. 8,453, ANGER, mechanism for operating ventilating sashes. 9,197, HEATH, ascertaining height of an object or the distance of one object from another. 9,317, PRUCE, apparatus for opening and closing fanlights, &c. 10,591, ROLLINSON, tubular or timber expansion framings and scaffolds. 10,646, ROBERTSON, double-hung sash and cased windows opening inwards. 11,884, HAYDOCK, hand planes. 13,643, LAKE (*Piccard, Pictet & Co.*), crushing mills. 14,703, LEGGOTT, openers for fanlights, &c. 18,837, COOMBS, sanitary refuse receptacles. 23,057, GÖLKEL, clamping device for work benches. 23,488, ADAMS, methods for "setting" articles in kilns. 24,019, OSBOURN, dirt traps for steam-heating systems.

1902.—632, BROWN, draw-off taps. 1,819, GOODRIDGE, non-septic purification and utilisation of sewage from country mansions and large houses. 2,848, STROHM, circular saws. 3,441, ECKSTEIN, window sashes, casements, &c. 3,506, WILSON, shutters, doors, &c. 4,019, NEWTON (*New Jersey Wire Cloth Co.*), fireproof constructions. 4,140, FLANAGAN, metal roofing sheets. 4,160, MEYER, stop cocks.

Law Cases.

Sealing of Agreements with Local Authorities.—The case of *Lawford v. Billericay Rural District Council* was recently heard in the King's Bench Division of the High Court of Justice. The plaintiff sought to recover the sum of £169 14s. as remuneration for his services as an engineer in preparing a report and plans and performing other duties in connection with a sewerage scheme which was being carried out by the defendants. The defence was that the agreement on which the plaintiff relied was not a valid agreement binding on the defendants because their common seal was not affixed to it. In giving judgment Mr. Justice Darling said he regretted to have to come to the conclusion that it was necessary, in order that this agreement should be binding upon the defendants, that it should be under their common seal. No decision, so far as he could find, had got rid of the principle defined by Lord Denman in the case of *Church v. Imperial Gas Co.* (6 A. and E., 846) and which was assented to by the Court of Exchequer in *Mayor of Ludlow v. Charlton*. The common seal of the defendants had been put to the original drainage scheme, and to have exacted the use of the seal in the case of the extension scheme could not have caused great inconvenience or have tended to defeat the object for which the corporation was created. The plaintiff chiefly relied on *Clarke v. Cuckfield Union*, but, in his Lordship's opinion, that case did not avail the plaintiff. He could not find the rule anywhere laid down that the objection of the want of the common seal could only be held good in the case of executory contract. Judgment for the defendants.

An Architect's Action for Slander.—On Friday last in the King's Bench Division of the High Court of Justice the case of *Low v. Tinnelly* was heard. The plaintiff, Mr. W. R. Low, architect, Basinghall Street, sued Mr. Thomas Tinnelly, a member of the Feltham School Board, to recover damages for slander. It appeared that the plaintiff was employed by the Feltham School Board to prepare plans and specifications and take out quantities for the erection of a school for them, and according to his case the specification, as usual, provided that the charges of the plaintiff for the preparation of the quantities and lithographing them should be paid by the contractors. The defendant, it was said, on July 16th, 1901, convened a meeting at the Board school, Feltham, which he hired for the purpose, and at which he spoke the words complained of. They were to the effect that the contractor had to submit to a specification drawn up by Mr. Low, "by which Mr. Low collars his fees twice over, and no contractor gets a chance unless he submits to what I call a downright fraud." The defence was a denial that the words complained of were spoken and that the provision of the specification as to the architect being paid by the contractor for the preparation of the quantities and lithographing was usual. Further, it was denied that the words bore the meaning which plaintiff alleged, and it was pleaded that they were, if spoken at all, uttered without malice in the belief that they were true, and, being addressed to the defendant's constituents and ratepayers of Feltham, were privileged. The learned judge held that the occasion was privileged; but declined to hold that there was no evidence of malice. There was, he thought, strong evidence if the jury believed that the defendant was not using the privileged occasion as such. If the defendant said that the plaintiff got his fees twice over he thought that was an abuse of the occasion. Therefore, the question came back to whether defendant used the words. The jury said they found the words complained of were used, and that they exceeded the privilege of the occasion—that they were used recklessly rather than out of spite, and they awarded the plaintiff £50 damages. Judgment accordingly.

"Design Laying" is the title of No. 44 of the "Useful Arts and Handicrafts" series issued by Messrs. Dawbarn & Ward, Ltd., 6, Farringdon Avenue, E.C., price 6d. nett. It is written by Mr. Thomas Bolas, F.C.S., F.I.C., and describes the methods of tracing, transferring, reversing, enlarging, reducing, repeating and fitting designs for use on all kinds of fabrics and materials.

Views & Reviews.

Fletcher on Light and Air.

This new edition of the late Professor Banister Fletcher's well-known book has been revised and rewritten by his sons, and full reports are included of the recent important appeal cases of *Warren v. Brown* and *Home and Colonial Stores v. Colls*; other modern decisions being also given, and six new coloured plates added illustrating the effect of new buildings on existing easements. Reference is made in an "introductory note" to the recommendations of the joint committee of the Royal Institute of British Architects and the Surveyors' Institution which sat to consider the existing law of light and air, but the authors are not of opinion that the methods suggested by that committee will justly meet the requirements: they are inclined to think that the present methods are the best, with the exception that a professional assessor or assessors might sit with the judge, as is customary in the Admiralty Division. Moreover, they observe that the committee seem to have overlooked the fact that, if the easement to light and air is to be abolished, this should also apply to any other kind of easement—"A purchaser is as much entitled to buy a house with dominant lights as he has (*sic*) to buy one with any other easement, such as a right of support, &c." The twenty-seven diagrams of cases at the end of the book, with their accompanying letterpress, are most useful in illustrating the various decisions; while the numerous details of the law are clearly set forth and explained in the several chapters. The book is well arranged, and reference is consequently easy.

"Light and Air," by the late Professor Banister Fletcher, 4th edition, revised by Banister F. Fletcher, A.R.I.B.A., F.S.I., and H. Phillips Fletcher, A.R.I.B.A., A.M.I.C.E., barrister-at-law of the Middle Temple. London: B. T. Batsford, 94, High Holborn, price 6s. 6d.

The Great Smoke Plague.

This is a practical book on smoke-prevention and should be in the hands of all those interested in the problem. Since 1890 the author has been Chief Smoke Inspector for the city of Sheffield, and having in addition read most that has been written on this subject and seen almost every device that has been discovered, he is in a position to speak with authority on the matter: and he does so briefly and lucidly, wasting no words on theories, but devoting himself entirely to the existing conditions of things, describing what has been done, and making suggestions for further improvement. For the sake of clearness he assumes that there are two kinds of smoke—preventable and unpreventable; meaning by the former that thick black smoke, or unburnt carbon, which can and ought to be consumed; and, by the latter, smoke which has lost its carbon constituents and is thin and of a varying colour when emitted from the chimney. The author observes that those who say hard things against the local authority for their inactivity and supineness in not suppressing smoke other than black would do well to remember that the authority has no power to do so; though it is very evident that such power should be given; and the author suggests that section 91 of the Public Health Act, 1875, should be amended by the substitution of the word "dense" in place of "black." The prevention of smoke from private dwelling-houses and from steam boilers is dealt with (a long chapter being devoted to smoke-preventing appliances for the latter), and reference is also made to cures, special and gas-fired furnaces, and to metallurgical furnaces: as regards the last, the author demonstrates that the doors used are of the wrong kind so far as smoke-prevention is concerned. The difficulties attendant on the prevention of smoke from sheet mill and similar furnaces are many, but it has been proved that much of the smoke can be prevented without injury to the trade and without restricting the output; throughout the book, however, the author emphasises the necessity for the fireman or stoker to co-operate with the machinery provided, and to use it intelligently—"he can, if he will, prevent at least 80 per cent. of the smoke which is now being belched into the atmosphere." In view of the fact that the smoke from dwelling-house chimneys is so largely responsible for the existing evil in towns and cities, it is to be

regretted that the author has not devoted more space in illustrating and describing the chief smoke-consuming devices introduced by numerous firms, in the same way as he has dealt with the various smoke-preventing appliances for boilers and furnaces.

"Practical Smoke Prevention," by William Nicholson. London: The Sanitary Publishing Co., Ltd., 5, Fetter Lane, price 3s. 6d. nett.

Conditions of Contract.

By writing this very able book Mr. Macey has performed a service to architects, builders, lawyers and others materially affected by the conditions of contract in building works. Conditions of contract are such all-important documents that it is surprising a similar treatise has not appeared before, as the legal decisions and other matters relating to the general conditions were formerly only to be found distributed in many books and periodicals. The book is arranged on the convenient principle of enumerating each clause in order and explaining it by notes below. In addition, however, tables of cases, short summaries of the decisions, suggested forms of tender, agreements, schedules of prices &c., are given. Of course, such a large work of this kind is not in handy form or short enough for use as a reminder in everyday practice in writing specifications, but it should be read thoroughly by all architects and contractors, and the subject mastered. The book contains, we are glad to see, a glossary of terms, and there is a good index at the end—a most important requirement in a work of reference.

"Conditions of Contract relating to Building Works," by Frank W. Macey. Revised as to strictly legal matter by B. J. Levenson, Barrister-at-Law. London: Sweet & Maxwell, Ltd., 3, Chancery Lane, W.C., price 15s. nett.

Bridge Construction.

It is unnecessary to review at great length the third edition of Professor T. Claxton Fidler's "Bridge Construction," as this standard work on the subject is so well known. This edition has been revised in connection with railway bridges, for, on account of the continued increase in the power and weight of locomotives entailed by the growth of railway work, the consequent heavier loading of bridges has necessitated a change in practice. The calculated tables giving the sectional area of struts are extended to include struts of mild steel. The general title of the book is misleading, as iron and steel bridges only are dealt with, and no reference is made to bridges of stone, concrete and wood, as might be expected from the title: indeed, we think it a pity that Professor Fidler has not extended it to cover the whole subject of bridges, which would not entail a very large addition; or he might write a companion volume. The omission cannot be defended on the grounds that iron and steel bridges are the cheapest and most convenient, and therefore should be the stock-in-trade of the engineer, for it has been found in America and elsewhere that granite and concrete bridges offer considerable advantages over iron ones, both in cheapness and lasting quality. Then, again, for temporary work timber bridges are undoubtedly the cheapest, and if built more substantially might last fully half a century, or longer: for footbridges over railways, canals, &c., they should be more extensively adopted. For some time past there has been much talk about the need for the co-operation of the architect with the engineer in the design of bridges, and this book provides many instances of illogical designs, which are not final in their form; that is, they are not functional. It will, however, be necessary for architects, before they can expect to be fitted to advise, to possess a considerable knowledge of the problems entailed in the design of bridges, and there is no better work for this instruction than Professor Fidler's treatise. It is quite wrong to suppose that a work of art can be secured by adding ornament to the engineer's skeleton; the architects must take a hand in the modelling of the structure throughout in order that it may be made organic.

"A Practical Treatise on Bridge Construction: being a Text-book on the Design and Construction of Bridges in Iron and Steel," by T. Claxton Fidler, M.I.C.E., Professor of Engineering, University College, Dundee. Third Edition. London: Charles Griffin & Co., Ltd., Exeter Street, Strand, price 30s.

ANCEY GATEWAY.

A CRITICISM OF THE BY-LAWS.

A PAPER on the building by-laws of Plymouth was read by Mr. Arthur S. Parker, A.R.I.B.A., before a recent meeting of the Three Towns Branch of the Devon and Exeter Architectural Society. Mr. Parker said that the Plymouth by-laws were largely a copy of the Model By-laws of the Local Government Board. Although the model code was framed on sound general principles, it had also been found to be imperfectly suited to rural districts, and the Local Government Board had recently issued, by request, a modified code for rural district councils. In the modified by-laws no proper allowance was made for sanctioning temporary iron churches, chapels or schools, although such facilities were clearly desirable for stated periods to enable congregations to be formed preparatory to the erection of permanent buildings. The isolation of 30ft. required for exempted buildings over 15ft. in height necessitated a larger site than was needed for permanent structures. An isolation of 10ft. or 12ft. should amply suffice to satisfy the idea of iron buildings catching fire, instead of 30ft. The model code in respect to the formation of new streets was inadequate for large towns. The minimum width of 36ft. generally followed had produced miles of streets throughout England insufficient for modern traffic, including tramways, especially where such streets were main arteries to adjoining districts. The widths had recently been increased in the Plymouth by-laws, but without reference to such streets being tributary or main thoroughfares. In hilly towns such as Plymouth the absence of a limit of gradient in the formation of new streets had allowed landowners the liberty of arranging their streets at right angles to the slope of the hill, instead of being laid obliquely to lessen the incline; and as streets, once formed, were absolutely permanent, the results to successive generations were infinitely more important than the convenience of building owners. It was to be hoped that before many years elapsed an alteration of opinion might cause fewer sewer ventilators in the main streets, especially in new estates, with further provision for proper elevated shafts. A stone wall 30in.

practicable in Plymouth to utilise the roof space in houses of ordinary span without the use of a mansard roof for the additional accommodation which could otherwise be provided at a very small first cost. Mr. Parker said that it would also be well on the score of economy for modern opening skylights to be acknowledged in by-laws. Much thought was given by borough authorities to devise workable schemes for the housing of the working classes, but little attention was given to the removal of hindrances in their own by-laws. Again, walls for an outhouse 5ft. long by 7ft. high were required to be 18in. thick for stone or 9in. for brick, by not being separately classed from main structures. The great strength and economic use of buttresses for strengthening walls was practically ignored in the schedule of wall thicknesses for warehouses and public buildings, notwithstanding the standing proofs in ancient buildings.

The by-laws most affecting the vital interests of the town were those relating to the requirements of open spaces at the rear of buildings. Public buildings, warehouses, factories, churches, breweries and public halls were not compulsorily required to have open spaces, the meaning of this exclusion being that they were not habitable dwellings. The requisition was applied to nominally one class of build-

ing, defined as "domestic," but, as a matter of fact, this by-law term included every other kind of building not of the public building or warehouse class. It, therefore, included numerous buildings inhabited to a much less extent than factory buildings, and quite apart from domestic use. These by-laws were not qualified in Plymouth as to the nature of use for which the building was constructed, nor for variations in districts or areas as provided in some towns, nor was there consideration given to buildings abutting on old streets formed before by laws were made, as provided for in London; nor was there any equitable rule whereby an efficient air-space could be obtained, without unduly damaging the value of the site, as full width space at the rear above the ground floor of business premises of shallow depth, such as was clearly set forth in the London Building Act. On the contrary, lock-up shops with offices over, re-erected on old sites in the very heart of the town, were required to be treated in precisely the same way as domestic dwellings in Laira or Compton, with an open yard or garden at the rear on the street level, notwithstanding that all the virtues of open space for air could be obtained over shop or ground-floor levels. The consequences were that persons owning property in the chief streets—especially where the site was not of great depth—were unable to rebuild at all without losing one-third or even one-half the ground area of their valuable premises. Consequently restoring and patching the old premises had to be resorted to instead of rebuilding.

Ancey is a peaceful old town in Savoy hemmed in on three sides by mountains which almost enclose the beautiful lake that borders it. Canals run inland from this lake, affording many picturesque street views; the streets themselves are mostly provided with stone colonnades, and on market days the country-folk arrange their wares under the arches. The two views shown on this page are typical of a small French agricultural town. An illustration of the Palais de L'Ile and some additional particulars of Ancey were published in *THE BUILDERS' JOURNAL* for May 8th, 1901.

BATTERSEA HOUSING COMPETITION.

THE Battersea Council recently invited competitive designs of houses for the working classes, consisting of five types of houses, as follows:—(1) A house of two storeys containing not more than five rooms and scullery, &c.; (2) a house consisting of two self-contained tenements containing three rooms and scullery, &c., on each floor; (3) a house consisting of two self-contained tenements containing four rooms and scullery, &c., on each floor; (4) a house consisting of three self-contained tenements containing three rooms and scullery, &c., on each floor; and (5) a house consisting of three self-contained tenements containing four rooms and scullery, &c., on each floor. The instructions were furnished to 106 persons, and fifty-eight sets of designs were submitted. On January 31st the Committee met and received these designs. They appointed Mr. Thomas Blashill, late superintending architect to the London County Council, to assist them in the matter. The Committee on several occasions conferred with Mr. Blashill, and in view of the number and class of designs submitted they were in favour of awarding four extra prizes of £10 each in addition to those of £50, £25 and £10 already agreed upon; and having obtained the authority of the Council to do so, they came to the following decisions:—(a) That the authors of design No. 37 have submitted the best set of designs, particularly as to the cottage and the four-room tenements; and the first premium of £50 is awarded to Messrs. G. T. Smith & Weald, 10, Guildford Place, London, W.C. (b) That the author of design No. 12 is the next in merit, particularly as to the three-room tenements; and the second premium of £25 is awarded to Mr. J. Sydney Bucklesby, of "Fairlawn," Kingston Road, Merton, Surrey. (c) That the author of design No. 21 is the next, particularly as to the four-room tenements; and the third premium of £10 is awarded to Mr. H. Bertram Tarrant, 27, Devereux Road, Wandsworth Common, S.W. (d) That the authors of the following designs (placed in the order of their number) be awarded the extra premiums of £10 each upon their consenting to allow the designs to become the absolute property of the Council, the condition already attached in cases (a), (b), (c):—

No. 4: Messrs. Haigh & Spencer, 19, Spencer Road, Wealdstone, Middlesex.

No. 8: Mr. W. G. Lewton, 6, "The Forbury," Reading.

No. 19: Mr. William West, 19, Craven Street, Strand, W.C.

No. 23: Mr. F. J. W. Goepel, 36, Bulwer Road, Leytonstone, Essex.

The designs are on exhibition this week at the Municipal Buildings, Lavender Hill, S.W., from 2 p.m. till 5 p.m. to-day and on Saturday, and from 2 p.m. till 9 p.m. on Thursday and Friday.

Caerwent Explorations.—Lord Llangattock, in a letter addressed to the chairman of the Newport (Mon.) Museum and Art Gallery, expresses his satisfaction at the prospect of the treasures from Caerwent being deposited at Newport. His lordship feels most strongly that they should not be taken out of the county, and has evidently considered the difficulties in the way of arranging for the proper custody of the remains at Caerwent itself. There is some probability too that the Roman remains at Caerleon will ultimately find a more fitting resting-place at Newport Museum.

Greek Antiquities.—Dr. Dörpfeld, the Director of the German Archaeological Institute at Athens, acting on his conjecture that Homer's island of Ithaca, of which Odysseus was king, was that now known as Santa Maura (Leucadia), which lies to the north of Thiaki, has been making excavations there. He believes that some of the remains he has already discovered, including objects of art and traces of monuments and aqueducts, date from the Homeric epoch and confirm his theory. The Archaeological Committee has decided to restore the Erechtheion. The greater part of the famous ruin on the Acropolis is still standing, and the fragments necessary for its complete reconstitution are all lying around.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Classic art had to portray only the finite, and its forms could be identical with the artist's idea. Romantic art had to represent, or rather to typify, the infinite and the spiritual, and therefore was compelled to have recourse to a system of traditional, or rather parabolic, symbols. Hence the mystic, enigmatical, miraculous, and transcendental character of the art-productions of the Middle Ages.—HEINRICH HEINE.

Our Plates. THE two semi-detached houses and stables in North Hill Road, Headingley, Leeds, were completed last year for Mr. J. A. Holroyd. The elevations are in red-pressed bricks, Morley stone, red-tile hanging and red-tiled roofs; portions of the exterior walls are carried out in timber and plaster. All the drains run direct to manholes or have iron inspection eyes at bends. Upon the north and east the erection has to follow a building line. In the south house the hall is panelled with kauri pine stained and polished. The drawing-room is panelled with American yellow-pine painted white and the dining-room is panelled in oak. In the north house the hall is panelled in American yellow-pine. The photographs are by Mr. Charles R. H. Pickard, of Park Lane, Leeds. The architect is Mr. Albert E. Dixon, A.R.I.B.A., of 5, Park Lane, Leeds.—"The Croft," Newark-on-Trent, has recently been erected for Mr. W. B. B. Quibell from designs by Messrs. Brawill & Bailly, architects, of Nottingham and Newark, and the work has been admirably carried out by Mr. William Smith, builder, of Newark. The house consists of a spacious panelled entrance-hall, with cloakroom and lavatories, &c., morning-room, dining-room, drawing-room, with convenient kitchen offices, all of which are on the ground floor. On the first and second floors are a billiard-room, seven bedrooms, two bathrooms, linen and box-rooms, &c. The whole of the premises have been fitted up with a self-contained electric-light plant, which has been carried out by Messrs. Furse & Co., of Nottingham. All of the rooms, halls and corridors, &c., have been heated with hot-water, which has been carried out by Messrs. Howitt & Sons, of Newark. The exterior of the house is constructed of red bricks and the upper portion of tile-hanging and half-timber, the roof being covered with red tiles.

The late Mr. Oldfield. MR. EDMUND OLDFIELD, M.A., F.S.A., Hon. Fellow of Worcester College, Oxford, died recently in his eighty-sixth year. He was in his day a considerable authority on architecture and classical archaeology. For many years he retained the honorary office of librarian of Worcester College. He became assistant keeper of antiquities at the British Museum, and was associated with Sir Charles Newton in organising and developing that department. He was the author of several papers on subjects of classical archaeology, including those on the Mausoleum of Halicarnassus. He was placed on the committee for the decoration of St. Paul's, and was a strong opponent of the designs of Mr. William Burges, which were illustrated by a model exhibited at the Royal Academy. Mr. Burges, in the early 'sixties, had carried out in the chapel of Worcester College an elaborate scheme of decoration and colour which met with Mr. Oldfield's strong disapproval, and was quoted as a warning against the employment of Mr. Burges upon St. Paul's.

Decorators and Architects. THE Incorporated Institute of British Decorators held its annual dinner last week. Mr. J. D. Grace (the president) occupied the chair. Mr. W. G. Sutherland, in proposing "The Incorporated Institute of British Decorators," said that their chief aim was to bring together decorators, and to show that they had some higher aim in view in raising the standard of their art. The chairman, in reply, said there were two questions he would like to see dealt with: first, some method of arbitration should be established which would save a great deal of misunderstanding and litigation; and, secondly, a form of contract should be devised between decorators and architects, which, while leaving

freedom to the latter, would not prove oppressive to the decorator. "The National Association of Master-Painters of England, Scotland and Ireland" was proposed by Mr. M. Cawton (past-president of the Painter Stainers' Institute). Mr. J. G. Cole replied for Wales, Mr. John Scott for Scotland and Mr. Sibthorpe for Ireland.

Truro Cathedral. THE Building Committee of the Truro Cathedral met last week for the further consideration of the report of Sir Thomas Drew on the cracks which have developed in the nave piers of the cathedral. Sir Thomas Drew, in his report, which was dated January 14th, said that he had no adverse criticism of the designer of the piers. He could not say, however, that he personally accepted the view that the modern methods of rigid and inelastic constructions, the fine jointing in laying stone, was an advance upon ancient practice. The cause of disaster obviously to him arose from the modern specification as to mortar and bedding observed with a precision which was quite unusual in less conscientious builders. Beds of piers in old work were usually laid in a comparatively thick bed of mortar, not too good, which lent itself to a certain elasticity. At Truro the mortar was to be theoretically perfect as a cohesive cement and the jointing theoretically perfect. The result was that the several drums of the columns became so perfectly adhesive that the pier became practically a monolith, with the attendant risk of undistributed pressure all coming on a single bed under the plinth. The provision of a damp course of asphalt added to the evil. Although it might be urged that as there had been no spreading of the first fracture the base stones had found their bearings and might remain, he would not take the responsibility of advising such inaction. It was possible that at some time or another some disturbance might affect the true plumb in the piers, and the least shift of pressure on the fractured bases might mean disaster. He therefore recommended that the fractured stones be taken out and replaced with sound stones of a harder kind than the Bath stone used in the original construction. The rubble foundation should be lowered to admit of a level copestone of strong concrete. The Committee resolved, in view of the fact that cracks have not increased in nine months in spite of heavy weights being placed upon them, to defer the removal of the bases of the piers. The construction of the groining will now be proceeded with.

The Latest Discoveries in the Forum. SIGNOR BONI, Director of Excavations in the Roman Forum, has found a prehistoric tomb in the bed-clay about 12ft. below the level of the Sacred Way, opposite the Regia, and close by the Temple of Antoninus and Faustina. The tomb is believed to date approximately from the eighth century B.C., and contains a large urn of black ware full of calcined bones, and several vessels. But more important architecturally is the clearance that has been made round the Temple of Castor and Pollux, the three massive fluted columns of which rival those of the Temple of Saturn as the most striking monument in the Forum. The earth and ruins having been removed, the foundations of all the east side of the temple have been laid bare in such a way as to make it possible to reconstruct the plan of the building. During the clearing many remains and fragments of the temple were discovered, the most interesting being an enormous block of marble belonging to the tympanum or spandrel of the temple on the side facing the Lacus Juturnæ. Close to this big fragment was found a capital, almost complete, the decoration of which, with that of the large fragment, will make it possible to determine the form and the richness of the decoration of the whole tympanum. It is hoped that when the earth has been entirely removed from the site of the interior of the temple some fragments will be discovered that may throw light on the internal character of the building. By a fortunate circumstance these immense marble blocks could not be taken away by the thieves of the Middle Ages and of the Renaissance, since they are firmly embedded in the tiled pavement surrounding the temple, through which they crashed as they fell from their position 100ft. above the ground.

R. I. B. A.

TRADITION IN ARCHITECTURE.

A MEETING of the Royal Institute of British Architects was held last Monday evening, Mr. William Emerson presiding. Mr. Alexander N. Paterson, M.A., read a paper on "Tradition in Architecture: its Function and Value," of which the following is a summary:—In defining the scope of his paper, while guarding against a tendency to give undue prominence to the inheritance and teaching of past times, the author sought to carry his audience with him in regard to the vital importance of tradition as an element in all art of permanence and value, in the hope mainly that the far-reaching voice of the Institute—not only within our own shores but throughout the Britains beyond the seas—might be expressed and asserted to restrain, to counteract, to check the too easily learned and pernicious teachings of the so-called "new art" movement, with certain cognate developments in English architecture. In using the term "tradition" he wished to disentangle it from another term with which it was apt to be confounded, namely, archaeology. The idea expressed by the word "tradition" in this connection was, briefly, the influence, both conscious and unconscious, upon us as workers in art to-day of the methods of seeing and doing on the part of the many generations of workers who have preceded us, and who when in life were engaged in like problems to these which now occupy us. Tradition in this sense as regards architecture was twofold, viz., tradition in construction, tradition in design. Tradition must not be confused with style. Styles have their day, and pass. Tradition endures. It must also be clearly differentiated from archaeology. The archaeologist's attitude is that of the scientist, not the artist, much less the art-worker. Defining the term "art" in relation to architecture, the author said that it was the living creative interest which devotes itself to the design and erection of buildings which will satisfy the requirements, and be in accord with the sentiments of the time; that the art in these buildings is a necessary and natural outcome and development of similar work in the past, of which the technique is learned consciously and unconsciously through tradition; and that archaeology (with history in its train) is, at best, a science by means of which we may arrive at more precise knowledge regarding certain aspects of such work. That we should be able to say that a moulding is early, late or transitional will not influence our powers of plan and design; its true importance to us is that in gaining exactness of knowledge as to such details we are bound to increase our knowledge of the work itself, of the constructional difficulties and the means by which they were overcome and rendered unexpected points of interest, of the infinite variety, the enveloping harmony and the crowning beauty of the building, which through years, and maybe centuries, of growth ultimately reached the completed, the organic form in which we see it. Only—let such enthusiasm be kept under restraint. Do not let us take it for granted that because a feature looks well in an old building therefore it will be equally effective if tacked on to a new front.

In the spirit of the old work we admire there are no qualities more pre-eminent than directness of aim and honesty of purpose. These two qualities we shall find to be most surely preserved by working after the methods of our more immediate forbears. Architecture, of all the fine arts, is most subject to convention, and that under two main influences—the one immovable, unchangeable, the limitation of that construction through which it must express itself, and which in its turn is subject to the all-pervading law of gravity; the other, as constantly but gradually changing, the physical, mental and spiritual requirements of those for whose use buildings are designed, together with the effective range of constructional resources at our disposal wherewith to satisfy these requirements. The accumulation of the tradition of former ages has provided us with certain methods, certain formulæ of construction, from which we cannot escape. On

the other hand, it is only from our immediate predecessors, and even contemporaries, that we can gather to what extent the immediate requirements of the day must guide us in our use of these formulæ, and what constructional resources are available for the purpose of extending their scope. The leading contours of mouldings and the principles regulating their use, the right and beautiful in proportion—such as these are the traditional data with which architectural design is produced; it is only when novel materials intervene, or in a particular situation, that variations, even to the extent of discords, are admissible and, in their place, admirable. Be sure, however, of the harmonies before introducing the discords. Only the master can successfully cope with the bizarre, the unexpected. There may indeed be a bondage of tradition as of archaeology, but this is impossible when (and this the author took to be an essential and vital principle in the truly traditional attitude) it is accepted in its widest form, when the tradition of yesterday and even of to-day is regarded as of not less but more importance than that of the century of Wren, of the Gothic master-builders, or of the Greek and Roman classics, when the tradition of steel girder, plate glass and electric light is accepted along with that of stone vault and flying buttress.

The author went on to speak of the present position of architecture in this country. For nearly a hundred years England has followed a path all her own in such matters, with results which can scarcely be called successful. The path has led, as it were, through a maze, and we are likely to end, when we emerge, precisely where we entered. Meanwhile neighbouring Continental nations have been quietly pursuing and developing the traditions of earlier times in the light of modern opportunities and requirements, guided therein by a continuous and systematic study of architecture, with the result that, as regards civil architecture in particular, they are far ahead of us in achievement. Few modern English buildings compare with similar work in Paris and other European centres in any of the attributes which constitute architecture a great art; yet English work of earlier date is equal, if not superior, to foreign. The moral is obvious: the fault is not the nation's or the men's, but the point of view, the methods, and, above all, the lack of continuous tradition; while, if the doctrines of the "modern school" are to prevail among our younger men, the outlook for the future is still worse. The author briefly glanced at the architectural history of England during the nineteenth century to make clear this idea. Within the last few years, however, the value of tradition, modern as well as ancient, has shown a tendency to reassert itself; architecture, along with the crafts which nourish it, has been revived, the true principles of design are being taught with organised effort, and but for this curious "new art" development there was good hope that English architecture would again assert itself in its natural and national characteristics of dignity and refinement. Of the doctrines of this "new art" or "modern school" there were various manifestations; the one prevailing tenet seemed to be that the "copying of styles" is to be avoided as a deadly sin. Why? asked the author. It was the first time in the history of architecture that a like position had been taken up, for it was surely an admitted fact that, from Assyria and Egypt onwards, the architects of Greece and of Rome, of the Romanesque, Mediæval and Renaissance times, had no other idea in their minds but, in working out constructionally their fulfilment of temporary requirements, to copy the styles which had gone before as they knew them. Did the work thus produced suffer in regard to sympathy with the needs of the times, to nobility, to beauty, even to originality thereby?

It is to this taboo of the styles that the characteristics of the new movement are to be traced. The refusal to employ the formulæ thus provided has its necessary result in the prevailing baldness, the absolute lack of variety and movement. The styles, especially those of the last few centuries, are essentially the product of civilisation; the architecture of modern times is mainly that of the city; but as recent precedents must be ignored, and architecture

cannot escape from the traditional standpoint, inspiration must be sought in the times before city life existed, with a resultant sham rusticity, an assumed simplicity of living and thinking, entirely at variance with the thoughts and habits of those whose requirements the buildings are supposed to supply and even, if due investigation were made, with those of the designers themselves.

Another characteristic, the result of the same tendency, is the attempt to return to the conditions of working of those earlier times when the individual worker was—or is now supposed to have been—his own master in the particular portion of the general work to which he devoted himself. The said individual worker is, of course, under present-day conditions unable to play the part thus allotted to him, but if he is employed not by a "firm" but by a "guild" all is right, and the utmost latitude is at once allowed to the producer in matters of furniture and ornament, with a consequent loss of homogeneity and restfulness in the general scheme. The half-trained amateur, again, too full of art enthusiasm to consent to the drudgery necessary to acquire technical skill in execution—being an "artist"—must be allowed absolute independence.

Encourage the crafts by all means, give the craftsmen every liberty within their own spheres—the architect will be aided and stimulated by their co-operation and help; but his must be the guiding and controlling mind, and his work may, and often must be, independent of their aid. Let it not be thought that it is by working only on such line as those just touched upon, as its devotees would have us believe, that one can be earnest or even original. He was inclined to believe that the love of originality for its own sake was the root of all evil in the pursuit of the fine arts. For indeed that, desirable quality though it be, is just one that will not come by "taking thought" for it, and if it be sought after this fashion the result is but a superficial affectation which is at the opposite pole from those solid and enduring qualities which are of ultimate value in the arts. But if the architect, instead of seeking originality and endeavouring to take it by force of devious paths and strange revivals, is content to follow the quiet lines of tradition, holding at the same time true to himself and the requirements and opportunities of his day, it will be found to have sought him. Future generations will see in his works the special beauties and qualities of his period just as we to-day discover them in those of our predecessors.

A discussion followed in which Messrs. G. H. Fellowes Fryne, W. C. H. Wilson, Henry T. Hare, Colonel Prendergast, E. W. Hudson and William Emerson took part.

A Lecture on "Garden Design" will be delivered by Mr. F. W. Meyer before the Devon and Exeter Architectural Society at the Athenæum, Exeter, to-morrow, April 24th, at 7.30 p.m.

Coronation Decorations.—A letter has been sent from the Royal Institute of British Architects, signed by the president, the hon. secretary and the secretary, expressing the hope that those who are concerned with the erection of triumphal arches and other decorative trophies will seek the assistance of eminent artists for their design, instead of being content with the mere commonplaces of trade furnishers.

An Enormous Block of Granite was recently removed from its natural position at John Freeman, Sons & Co.'s Tregarden Quarry, Luxulyan. The block was found to be 55ft. by 26ft. by 20ft., and weighed about 2,043 tons. To remove this mass a hole 3½ in. in diameter was drilled to a depth of 19ft. 3 in., and into it 40lbs. of powder were placed. It is very seldom that such a mass is removed practically in one block.

A New Wesleyan Chapel at Euxton has been opened. The accommodation is for 200 adults or a mixed congregation of about 240. The principal elevations are faced with Accrington bricks, relieved with Lancashire stone dressings. The chapel roof is ceiled at the collar beam with visible timbers, wrought and varnished. Mr. W. H. Dinsley, of Chorley, was the architect, and Mr. William Hampson, of Chorley, the contractor. The cost of the building, exclusive of the land, amounted to £1,300.

SICILY AND ITS ARCHITECTURAL MONUMENTS.—VI.

By F. HAMILTON JACKSON, R.B.A.

(Continued from p. 98, No. 373.)

THE railway from Girgenti to Palermo runs through broken country till past Aragona Calda, the junction for Catania. Beyond Comitini it pierces a spur of the hills and enters the valley of the Platani, by the side of which it runs till within a short distance of Rocca Palumba. The hill-town of Sutura which is passed on the way is supposed by some to have been the ancient Camicus. The Arabs gave it the name of Sotir in 860. All through this valley the hills are very beautiful in form and distant colour. The outlines are strange, and often remind one of the Spanish Montserrat or of the Dolomites. Along the line the signal houses and stations are protected from mosquitoes by verandahs with large panels which are filled with wire-gauze. Before reaching Rocca Palumba the watershed between the two seas is passed by means of several tunnels, and the line then runs down to the coast along the valley of the Fiume torto. Before reaching Termini the line from Messina comes in, and from this point runs along a beautiful coast into Palermo, known to the Greeks as Panormos—all, harbour—a term which perhaps applied rather to the district than to the city. It is generally considered that the city was one of the Phœnician settlements, and coins found there bear in Phœnician or Hebrew letters the word "Sis" or "Tsits," which means "flower." It is probable that there was a Sicanian town here first, or why should the Phœnicians, a trading people, have troubled to establish themselves in the place? The modern name comes from the Arabic "Balarm" or "Balarmuh."

Hamilcar Barca encamped for three years on the Heircte, a portion of Monte Pellegrino, from 247 B.C. to 245, watching for a chance of taking the city, which the Romans had captured in 254 B.C. The place of his camp was known till quite lately as the "fendo dei Barca" and depended on the Monastery of S. Martino. He then grew corn enough to feed his army there, and though Pellegrino looks barren enough now it was covered with underwood down to the fifteenth century. Augustus made it a colony. In 440 A.D. Genseric and his vandals besieged it, and its stout resistance probably saved Sicily, and perhaps Rome, since he had to return to Carthage unsuccessful. Belisarius captured it from the Goths in 535 A.D., slinging platforms to the tops of the masts of his ships, which were higher than the walls, from which archers and slingers rained missiles on the defenders. Palermo was taken by the Arabs in 830 A.D., who made it their capital, and it rapidly became exceedingly prosperous. It was said at that time to have had 300,000 inhabitants, a number which is nearly equalled in modern times. The Normans took it in 1072 and it remained the capital of the island. The greater part of the prominent buildings, however, are the work of the sixteenth and seventeenth centuries, when the Spanish viceroys ruled the island, and the more interesting earlier works have to be sought for here and there. Of the antique period nothing remains, and the buildings which show Moorish influence were most of them built for the Norman kings, the splendour of whose court and whose artistic leanings combined to make Palermo the most cultivated and advanced city of Europe during the period of their prosperity.

Perhaps the most remarkable building in Palermo is the Cappella Palatina, which is in the Royal Palace at the top of the city, and is profusely decorated with marble inlay and fine mosaics; generally considered the most beautiful palace chapel in the world. It was founded by King Roger the First, and a document of 1132 A.D. still extant, signed by Peter, Archbishop of Palermo, declares it a parish church, "by special desire of King Roger." The consecration did not take place, however, until 1140, when, according to a homily delivered on the occasion, it must have been nearly complete, although William the First also decorated the chapel with splendid mosaics. Many restorations have since taken place which are recorded by inscriptions. The plan is a combination of

Latin basilica and Greek cross. The nave has five bays, and at the choir arch the columns are coupled and the level of the floor rises by four steps, and three more steps approach the altar, which is in a semicircular apse. The choir enclosure is of marble, pierced toward the nave and inlaid in other places with elaborately interwoven forms composed of many small pieces of coloured marbles. The aisle walls are sheeted with marble in their lower portion and covered with mosaic above, a band of inlaid work dividing the two. The roof is most elaborately painted with arabesques, figures, and animals, which have a curiously Persian or Indian look. It is "artesonado" and has other Moorish features. All the arches are pointed and stilted; the columns and capitals appear to be antique for the most part. Outside is a portion of a portico of similar columns which is said at one time to have surrounded the chapel. On the right are a twelfth-century pulpit with marble inlays and a carved Easter candlestick of the same period, added to at a later date. The subjects of the mosaics are chiefly taken from the lives of Christ, St. Peter and St. Paul, and Old

is so characteristic of the period, and appears in La Cuba, La Favara, La Zisa, and other buildings of the Norman kings. The rest of the Royal Palace is absolutely uninteresting, but the Porta Nuova which is attached to it, though baroque, is picturesque from inside, having a well-proportioned loggia above the gate and a pyramidal roof decorated with painted tiles, a mode of decoration which Sicilian examples make one sometimes wish was possible in our climate.

A short distance to the left is the curious church of S. Giovanni degli Eremiti, founded in 1132 and incorporating what was probably a mosque in its structure. It has five domes, plastered externally and painted red. The plan shows an Egyptian cross with three apses, of which only the central one shows externally; the nave is divided in the middle by a pointed arch which affords partial support to two of the domes. On the south are the remains of the mosque divided by a row of five columns. Under the Normans the whole building was used as a burial-place for the nobility. Attached are some pleasing cloisters of rather later date, now laid out as a garden, with a pointed arcade

S. GIOVANNI DEGLI EREMITI, PALERMO.

Testament histories. Those in the choir are the most ancient and were probably executed by Greek craftsmen, since the lettering of the inscriptions is Greek. The Madonna over the high altar, and the figures of St. Joseph and St. Anna in the side apses, are of the eighteenth century; the altars themselves are rather later, and the choir stalls are modern. At the other end of the nave is the royal seat with panels of small ornamental inlays and the royal arms. The red cross appeared to be made of paper stuck on to a slab of porphyry! Several doors in the chapel are interesting. One is of wood with large nails in the Moorish fashion, one of hammered iron, and two of bronze. Outside is a trilingual inscription of 1142 recording the erection of a water clock.

The palace occupies the site of the ancient castle. The nucleus is Saracenic, but additions were made to it directly after the Norman conquest and by later sovereigns. Of this work, however, the only portion now apparent is the tower of Santa Ninfa, which contains the Royal observatory and the "Stanze di Ruggiero," a room decorated with mosaic and marble, said to have been chosen by Roger as his own after the siege, with another adjoining, the details of which the guardians date with the most appalling inaccuracy! The tower is ornamented externally with the flat-pointed arcading which

and coupled columns. Some have considered this as a survival of the monastery of S. Ermete, one of the six founded by Gregory the Great in Sicily; but the present name is sufficiently explained by the fact that the monks whom Roger established there were of the order of hermits founded by S. William of Vercelli and Giovanni da Musco. Other churches of the same period are La Martorana, S. Cataldo and S. Giovanni dei Lebbrosi. The last is the earliest church near Palermo, having been built in 1071, while the siege was still in progress. It is called "dei Lebbrosi" because the lazaretto was afterwards established there by William the Good. The approach is through a tanyard and a garden, for the church lies back from the road. It has the usual dome over the crossing; the roofs are vaulted with a barrel vault and finished above with concrete and tiles set as a slightly sloping terrace. The entrance is between two low towers, one of which is occupied by a staircase which leads to the roof and to the custodian's rooms, for he lives in the fabric.

The two churches of La Martorana and S. Cataldo stand close together behind the Piazza Pretoria. San Cataldo was for some time used as the post-office, but has now been cleaned out and restored in a discreet manner. It is most interesting as showing the construction of

buildings of the type, since the walls are bare of mosaic or marble incrustation. It was probably founded about 1161 by Majone di Bari, grand admiral of the kingdom under William the Bad, a man of whom Falcando tells the most shocking stories, though his information has been proved false in one or two instances. What is certain is that he was murdered in the Via Coperta and that his prospective son-in-law, Matteo Bonello, was the first to plunge a sword into his side. The remains of the sword may still be seen hung at the door of the archiepiscopal palace. The populace dragged his corpse about the city in jest, Falcando says, who evidently hated him as much as the people must have done. The pavement of S. Cataldo is of the usual Opus Alexandrinum kind, and the altar front is of semi-transparent marble, with incised emblems. The Spaniards removed the mosaics in the seventeenth century, replacing them with stucco, now in their turn removed. La Martorana is so called because in 1433 it was given to the Benedictine nuns, whose convent close by was founded in 1195 by Aloisa, wife of Godfrey of Martorana, but it was founded by George of Antioch, admiral to King Roger the First in 1143, and was then called S. Maria dell' Ammiraglio. As might be expected from its parentage, it is a typical Greek church in plan, exactly like others which may be seen at Athens or Constantinople. It is square, with three Eastern apses, the dome supported on arches which spring from four columns as at S. Cataldo, and the other arches supporting the vaults arranged in the same manner. Against the triumphal arch of the apse are four colonnettes of porphyry and granite, and others in a similar position to the smaller apses; in front of them the pavement is raised. There is a door to the north and another to the south, and no doubt there was one also to the west from the atrium which was in front of the church, and where the judges of the city sat, and a notary, by name Enrico di Martino, exercised his profession. In 1588 the church was lengthened to the west, taking in the atrium and the portico. At this time the external mosaics were destroyed, except two showing King Roger before Christ and George of Antioch before the Virgin, which still remain inside, together with those of the ancient interior which cover the vaults and the upper part of the walls as in the Cappella Palatina. As there were not quite enough columns in the atrium for the fresh requirements, some were bought, and the registry notes the buying of two for 6 "onze" from the rectors of S. Antonio, and of three (two of marble and one of granite) for 38 "onze" from the Confraternity of S. Catherine of Olivella, with bases and capitals. (The granite one was cut up into four to heighten the others.) In the course of restoration fragments of plaster window-panels were found, proving, together with one found *in situ* at S. Giovanni degli Eremiti, that this was the usual manner of filling the windows at that time. After the Sicilian vespers, in 1282, the parliament met in this church to receive the ambassadors of Peter of Aragon and to swear fealty to him. The high altar, though baroque in design, is beautiful by reason of the exquisite colour of the precious Sicilian marbles of which it is constructed. The upper storey of the campanile and the cupola were damaged by an earthquake and taken down in 1726. Mongitore says that Fra Giacomo Amato, a worthy architect, "cried with grief" over it, saying that the damaged foundations ought to have been looked to, not the top of the building. It has a pointed arched entrance on the ground, and the first floor is decorated with inlays and the curious transverse rustication often found round the arches of the period.

Another ancient church very much altered in later times is the church of La Magione, founded in 1150 by Matteo Ajello, admiral to Roger the Second. It was at first held by the Cistercians, but Henry the Sixth expelled them because they favoured Tancred, and placed Germans there instead. It was at one time superior to the cathedral in riches and in the extent of its jurisdiction, and S. Giovanni dei Lebbrosi was under it. Works of restoration have revealed the existence of a painted roof, apparently of the fourteenth century, and some frescoes in the cloister. All these churches are of the kind of which the Normans found remains when they came to Sicily. The principal divisions internally

were the solea which divided the sacrarium and presbyterium from the nave or aisles by a low wall, a compartment on the north called *matroneum* for women, the men being on the other side in a space called the *senatorium*, and the three apses, the two side ones of which were called *diatonicon* and *protasis*, and were used for the sacred preparations. The exterior narthex divided the nave from the portico, an intermediate space for catechumens. The Normans found at Palermo a Greek archbishop, Greek priests at Troina, and six or seven monasteries in different parts of the island.

The ancient cathedral of Palermo was used as a mosque by the Saracens, and though restored and richly endowed by Count Roger it was not thought magnificent enough. King Roger therefore added S. Maria Inconcrinata, a chapel dedicated on May 15th, 1129, where he was crowned two years later. Here also the two Williams, the unfortunate Tancred, Henry the Sixth, Frederick the Second, Manfred of Suabia, Peter of Aragon, and all the Aragonese down to Martin, were crowned. After 1410 the kings of Sicily were crowned in Spain. Close to the chapel

was a loggia in which the king showed himself to the people, some remains of which are still to be seen in the Via del Papireto. The chapel itself was unfortunately destroyed in the bombardment of 1860. The cathedral, a building quite southern in appearance owes its erection to an Englishman, Walter of the Mill, who was archbishop under the two Williams. An inscription formerly existed in the apse which gave the date of the dedication of the cathedral to the Virgin of the Assumption as 1185. Two slender towers flank the apse, and two more very similar rise at the angles of the western façade. Three doors are in this façade: above the centre one is a very rich two-light Gothic window, while above the side doors are large windows divided into lights with slender columns. This façade is of the early part of the fourteenth century. The bell tower, similar in style, is on the other side of the street, forming part of the archbishop's palace, which is united to the cathedral by two large arches thrown across the Via Matteo Bonello. The south porch has a large central arch and two smaller arches at the sides; the gable above has

S. CATALDO, PALERMO. DRAWN BY F. HAMILTON JACKSON, R.B.A.

sunk panelling of elaborate Gothic design: it was added in 1450. The door within, with the mosaic panel of the Virgin and Child, is a little earlier. One of the columns here bears a Cufic inscription, and, no doubt, came from the old cathedral. Round the top of the walls runs a fanciful battlemented cresting, and the eastern end has inlaid arcading, something like that at Monreale. The exterior has many curious inconsistencies; for instance, pointed arched panels with mouldings enriched with the egg and dart, Greek honeysuckle forms inlaid above a corbelling the arches upon which are pointed and filled in with Renaissance shell forms, and, on the north side, a colonnade with an arch in the centre beneath a broken pediment the architrave of the door beneath which after passing the corner suddenly shoots up into a pointed arch, terminating in a scrolled keystone of late Renaissance type.

The interior was ruined by Ferdinand the First of Bourbon, the works occupying thirteen years and being completed in 1801. Ferdinand Fuga was the instrument. Ships were laden with porphyry, granite, jasper and lapis-lazuli torn from walls and pavement and sold over sea. The *chefs d'œuvre* of the Sicilian school disappeared or were destroyed and the sepulchral slabs and monuments broken up. The only remains of the ancient splendour are the sepulchres of the kings in the first two chapels to the right of the nave. Of these, four consist of porphyry tombs under canopies and two are of marble—one that of Constance of Aragon, an antique sarcophagus with hunting scenes, and the other that of Duke William, son of Frederick the Second of Aragon. The slabs with crouching figures which support King Roger's tomb show the height of Sicilian sculpture in the latter half of the twelfth century. The tomb is of simple form and made of slabs of porphyry cemented together. Those of Henry the Sixth and Frederick the Second came from Cefalù, where they were probably provided by Roger for himself and his wife. He died in Palermo, and was buried there in spite of the protests of the bishops and canons of Cefalù. Frederick the Second's is sustained by four great lions of porphyry seated on their haunches; on the cover are six circles carved with the figures of the Saviour, the Virgin and the Evangelists with their symbols. The columns and roof of the canopy are all of porphyry. Henry the Sixth's is similar, but the cover of the sarcophagus is smooth and it is not supported on lions but on slabs elegantly shaped. That of Constance, his wife, is later in date: its canopy is of marble and the columns have insertions of mosaic like those of King Roger's canopy. These tombs were originally near the chapel of the Sacrament, but in 1781 they had to be moved, and were then opened. Frederick the Second was well preserved. He was wrapped in a mantle embroidered with Arabic letters and designs; the crown sceptre and orb were laid beside him. Henry the Sixth was wrapped in a robe of yellow silk, with the imperial mitre with Arabic inscriptions at his feet. The sepulchres of King Roger and his daughter had been already rifled of everything valuable. A holy-water basin and reliefs of the Passion of Christ by one of the Gagini, and the stalls of the choir, are other noticeable things remaining in the cathedral. To the right of the choir is the chapel of S. Rosalia, the tutelary saint of Palermo, whose grotto is on Monte Pellegrino. Her shrine, which is carried through the streets in July, is heavy and extravagant in design, and weighs over 1,400lbs. of silver. The crypt beneath the choir is thought by some to be the most ancient church in Palermo. It is square, with eight columns of granite in the middle, but may have been larger before the present cathedral was founded. The arches are very strong and are pointed now, though the capitals suggest Lombard carving. Twenty-four archbishops lie buried in it, some of them in early Christian sarcophagi.

(To be continued.)

NOTICE.—We have made arrangements for the publication of concise answers to the questions set in the South Kensington Building Construction examinations which will be held on Saturday evening, May 3rd: and we hope to publish the answers to questions set in the Elementary Stage in our issue for the following Wednesday, May 7th.

FIRE TESTS WITH AUSTRALIAN HARDWOOD DOORS.

THE British Fire Prevention Committee has just issued Nos. 68 and 70 of its publications, dealing with fire tests with jarrah and karri doors. The former test was with a 1½in. framed jarrah door with 1½in. solid panels and a similar door of karri. The door openings were

test with a 2in. jarrah four-panel (bead flush both sides) door and a similar door of karri. The doors were of the same size and similarly hung as those in the previous test. The temperature averaged about 2,000 degs. Fahr. The following is a summary of the effect:—In 5 minutes smoke appeared over the top right-hand corner of the karri door and through the panel near the hanging stile; in 20 minutes smoke appeared at two points in the right-hand

CAPPELLA PALATINA, PALERMO. DRAWN BY F. HAMILTON JACKSON, R.B.A.

3ft. by 6ft. 9in., the doors opening inwards on the fire side. The following is a summary of the test, which lasted one hour:—In 1 minute smoke came through the joints of both doors; in 13 minutes flame appeared over the top of the karri door, and in 16 minutes flame similarly appeared over the top of the jarrah door; in 48 minutes the top rails of both doors were alight all along; in 53 minutes small holes were burnt through the karri door about the centre and bottom rails; in 57 minutes flame was extending downwards through the joints between the stiles and the upper parts of the frames of both doors; in 58 minutes small holes were burnt through the jarrah door about the centre rail.—Publication No. 70 deals with a

panel of the jarrah door, and in 26 minutes vapour appeared at the bottom of the lower left-hand panel of this door; in 28 minutes vapour appeared at two points through the joints of the lock rail of the karri door, and in 30 minutes both of the top panels of this door buckled inwards; in 30 minutes also vapour appeared at the lower bolt of the jarrah door; 5 minutes later a red glow appeared in the left top panel of the karri door and the lower left-hand panel was bulging slightly inwards; in 39 minutes the upper panels of this door buckled inwards and a red glow appeared in the joint between the hanging stile and the lock rail; in 46 minutes flame appeared at the top of the muntin of this door; in 50 minutes the top of the jarrah

door was bulging outwards; in 52 minutes a glow appeared between the slamming stile and the lock rail of the karri door, and also at the top left-hand corner of the lower panel and between the panel and the bottom rail; in 53 minutes the lower panels and muntin of this door were bulging outwards, and after the same time the jarrah door was bulging outwards at the slamming stile next the lock rail; in 56 minutes a red glow appeared in the slamming stile of the jarrah door about 6in. above the lock rail; in 60 minutes flame appeared over the top bolt of this door, and in 60 minutes also the muntin and upper panels of the karri door had fallen. At the close of the test the jarrah door was still standing, the slamming stile burnt through in two places, much bulged, and the joints of the panels next to the slamming stile open; while the door and frame of the karri door were practically destroyed.

AUSTRALIAN TIMBER BRIDGES.

AT a recent meeting of the Society of Engineers a paper was read on "Australian Timber Bridges and the Woods used in their Construction" by Mr. Herbert E. Bellamy, city engineer, Rockhampton, Queensland. At the outset he pointed out that bridges built entirely of timber were now seldom erected in England, but in the Colonies such bridges were very extensively employed. He then proceeded to discuss the life of such bridges, which, he said, was very varied, but might be put at from thirty-five to fifty-five years, according to situation and other circumstances. He then proceeded to describe a timber bridge which he had recently designed and erected in Queensland. This bridge is 320ft. long and 18ft. 6in. wide. It spans a creek 10ft. deep at high water, and which also has 20ft. of black mud below the bed. In flood times the waters rise 25ft. above the level of the ordinary high-water mark. The piles, which are of ironbark timber well creosoted, were described in detail, the sizes, lengths, methods of scarfing, driving, tests and covering with Muntz's metal being given. The cost of driving the piles complete, including materials, labour, plant, &c., was given at 4s. 6d. per lineal foot. The decking and its members are of spotted gum, and the cost was stated to be 99s. per square, including all material and labour. The total weight of all the timber in the bridge as fixed is about 200 tons, whilst the work of the ironwork fixed is 4½ tons. The total cost of the structure, including a small portion of the approach roadway, was £1,900. Mr. Bellamy then described the different varieties of Australian timbers—seventeen in number—mostly used in bridge-building and for other constructive purposes, specimens of all of which were exhibited. He referred to the distribution in the Colonies and the qualities, &c., of the principal trees. Of different kinds of timber suitable for bridges, ironbark, spotted gum, blue gum, blood-wood, blackbutt, box, mahogany, karri and swamp mahogany were stated to be amongst the most durable. Ironbark, mahogany, blue gum, blood-wood, swamp mahogany, turpentine or peppermint, tea, she-pine and cyprus pine are very durable when constantly immersed in water or in wet ground, and are therefore well adapted for piles, &c., for the foundations. Karri, which is a member of the eucalyptus family, is largely used for street-paving. Mr. Bellamy expressed the opinion that the good qualities of Australian timbers were not fully realised, otherwise they would be more extensively used both in Europe and America. He next described in detail the appearance of good timber, the chief qualification being slowness of growth as shown by the narrowness of the annual rings. He then enumerated the various methods of seasoning, which consist either in evaporating the sap by air-drying or in dissolving it in water and afterwards sun-drying the timber. Artificial drying is rarely resorted to with timber for engineering purposes. He then passed on to a consideration of the general causes of decay and the destruction of timber by worms and insects. The destructive methods adopted by the white ant and the *teredo navalis* for invading timber were explained, and the means employed for its protection against these pests were pointed out. It

was stated that copper sheathing was not permanently effectual in resisting the attacks of the *teredo*, but that creosoting, properly carried out, was the most successful of any process yet known. The preservation of timber was then considered, and the lecturer dealt with painting, charring, creosoting and impregnation with metallic salts. The last method, however, has not in all cases given satisfactory results.

Builders' Notes.

Mr. Samuel Manson, builder and contractor, of Scarborough, died recently at the age of sixty-six years.

Preston Builder's Affairs.—The public examination was recently held of James Varley, builder, of Preston. The statement of affairs showed gross liabilities £4,883 1s. 6d.; expected to rank, £724 1s. 6d. The examination was adjourned till May 9th.

The Adelaide Gallery Restaurant has been partly refloored by the Acme Wool Flooring Co. on the system patented by Mr. W. W. Duffy. East India teak and West Australian jarrah blocks are used, laid in herring-bone pattern on the ordinary boarded floor.

A Big Timber Yard Fire occurred last Saturday at Gainsborough, Lincolnshire, on the premises of Messrs. Newsum, Sons & Co., timber importers, who have extensive mills and warehouses adjoining the river Trent. An immense stock of planed and moulded work and prepared builders' materials was destroyed. Nothing was saved and the damage is estimated at nearly £100,000.

A SPEECH BY MR. EMERSON.

THE Cardiff, South Wales and Monmouthshire Architects' Society held its annual dinner at Cardiff recently. Mr. E. W. M. Corbett presided.

Mr. E. Seward in proposing the toast of "The Royal Institute of British Architects" coupled it with the name of its president, Mr. William Emerson, and referred to the unique position occupied by Mr. Emerson, who, with a true love of the romantic side of Gothic building, wove into its feeling the real spirit of the Oriental art. That was a complex sort of problem for an architect to attempt. In that respect Mr. Emerson stood alone. He had also taken a prominent part in such public matters as the Victoria Memorial Executive, of which he was a member. Mr. Emerson had lately returned from India at the request of Lord Curzon to consult regarding the Queen Victoria memorial for India.

Mr. William Emerson, in reply said it was a very real pleasure to him to be present, not only because he had come to meet the architects of South Wales, but also because some of his earliest interests in architectural matters had been aroused by objects in this district while he was a pupil of the late Mr. William Burges. The Royal Institute of British Architects had now about 1,800 members, and with allied societies it had about 3,000 or 4,000 members. The end and aim of the Institute were to promote the advancement of the art of architecture and to look after the interests of the profession. So far as the first aim was concerned he supposed that one of the principal ways in which to do this was the education not only of the public but the rising generation of their own profession. In the latter respect England was behind France, Austria, Italy and other European nations. But England had made decided strides, and this had been mainly the result of increased interest taken by the Institute in examinations. He was glad to know that this had had a popularising effect on them, and it was gratifying to find that last year no fewer than 670 sat for these examinations—a larger number than ever before. The architects of this country did not need anything in the shape of a diploma granted by Act of Parliament, but if these examinations were properly arranged matters would right themselves in time. Another point that he would like to say a word about was the want of *esprit de corps* among architects. The speaker deplored the way in which competitions were often started

by public bodies. They caused a tremendous amount of waste of time and energy among members of the profession. Competition was of course a good thing in some ways, but when it came to rushing into every single competition he thought that architects should make a stand against them unless every man was paid so much for his drawings, and some duly qualified assessor appointed. In reference to the rush of work nowadays he urged that more time was wanted to enable the architect to go more into the country in order to allow him to study the lessons which were to be learned from Nature, because a man with a true love of the beautiful would no more sit down and design some of the buildings that were to be seen in the streets of to-day than he would design a warehouse and call it a palace.

Keystones.

The Estate of the late Mr. Sidney Cooper, R.A., has been proved at £40,659.

Mr. William Jones, architect, of Morgantown, Merthyr, a nephew of the late Mr. John Williams, whose business he took over, died recently.

All Saints', Weston-Super-Mare.—The completed portion—chancel, nave and north aisle—of the permanent church of All Saints', Weston-super-Mare, has been consecrated. The foundation-stone was laid four years ago.

The Grove Park Workhouse, which was recently handed over to the Greenwich Board of Guardians by the contractor (Mr. Thomas Rowbotham), has cost £175,020, or £240 per bed, while that of a neighbouring workhouse of practically identical extent has been £257 per bed. Mr. Thomas Dinwiddy is the architect.

Stourhead House, a fine old Georgian mansion dating from 1720, the residence of Sir Henry Hoare, Bart., at Stourton, Wiltshire, has been destroyed by fire. The outbreak was due to a defective flue in a bedroom. The valuable pictures and heirlooms, of which the mansion contained a great store, were removed in safety, but the building was gutted.

Charles Kean's Scenery.—About 400 water-colour drawings, about 10in. by 7in., of the scenes and properties in the plays produced by Charles Kean at the Princess's Theatre are now to be seen in the Victoria and Albert Museum, South Kensington; and among them are many interesting architectural schemes. They have been presented to the nation by Mr. and Mrs. F. M. Paget, into whose possession they had come, Mrs. Paget being a niece of Mrs. Kean.

The Church Crafts League will hold an exhibition of the work of its artist members at the Church House, Westminster, S.W., from April 30th to May 30th, between the hours of 10 a.m. and 6 p.m. Admission is free and no tickets will be required. The collection of mediæval church ornaments which Mr. W. H. St. John Hope obtained for the "English Church Exhibition" at Brighton during the Church Congress in October last will also be included in the exhibition. The "private view" will be on Tuesday, April 29th, and the Lord Bishop of Rochester will formally open the exhibition on that day at 4.30 p.m. Cards of admission (for April 29th) can be obtained from the secretary, Mr. Francis Burgess, Church House, Westminster, S.W.

Manchester Society of Architects.—The report of the Council for the year 1901-2 gives the aggregate membership as 193 (an increase of eleven during the year). Reference is made to the Badge of Office which has been presented to the Society by Mr. Alfred Darbyshire, to be worn by the president for the time being. With regard to the proposal to create a Chair of Architecture at Owens College, the Council state that no effort will be spared by them to further this desirable object. The Competitions Committee report that they have formulated a scheme for appointing correspondents in various towns within the Society's area, as defined by the R.I.B.A., so that they can be informed early of any proposed competitions and get into communication with the promoters. The revenue account shows a deficit of £31 7s.

The Last of Fotheringhay Castle.—Lady Wantage has given the Peterborough Archaeological Society permission to protect the last remnant—a fairly large but shapeless piece of dressed stone and concrete—of Fotheringhay Castle, Northamptonshire, where Mary Queen of Scots was beheaded. The castle was dismantled in 1630.

Turner's House at Twickenham is to be offered for sale by auction to-morrow. Sandycombe Lodge, as the house is called) though Turner himself first named it Solus Lodge), is within three minutes' walk of St. Margaret's Station, and, it has been said, was built from his own design. This, however, seems doubtful, and even the period of his residence there is matter for conjecture. Some date it from 1814 to 1826, but Ruskin believed it was from 1808 until 1827. Turner learnt much of his art at Twickenham. He kept a boat and spent long days on the river, sketching and studying the water surface, colour and reflections, the changing cloud-forms, and the morning and evening mists.

Liverpool Architectural Society (Incorporated).—The annual report of the Council for the fifty-fourth session was presented to the first annual general meeting of this Society held on Saturday last. The Council drew attention to the fact that the past session marked the long-delayed incorporation of the Society. Unfortunately several of the older members, whose interest in the Society has for some years been dormant, regarded the incorporation as an opportunity to resign; so that the membership has slightly decreased. Reference is made in the report to the revived proposal to provide Liverpool with a cathedral, but the facts have already been published in these columns. The treasurer's account shows a balance in hand of £30 14s. 8½d.

The Tower of Cuenca Cathedral, Spain, collapsed last week. Three houses adjoining the cathedral and a large part of the cloisters were overwhelmed. The damage done is very great, and the whole cathedral threatens to fall. It appears that the dangerous condition of the cathedral tower was recognised so long ago as 1888, when a grant of 100,000 pesetas was solicited from the Government for its repair. The money was not forthcoming, and no adequate measures have since been taken to ensure the safety of the tower. As a matter of fact the burden of repairs should properly fall upon the municipality, but it is a duty which can hardly be efficiently performed by the *ayuntamientos* of small and impoverished towns, and it would be well if, in their case, the Government could come to their aid.

The Holborn to Strand Street.—The old hostelry known as Carr's, situated in the Strand at the extreme east corner of the new street, has been pulled down. It will be rebuilt on much more extensive and elaborate lines, extending eastwards to the Law Courts at the corner of Clement's Inn. The elevation, which was the first one to be approved by the London County Council, is Classic in design. The ground-floor storey up to and including the cornice will be of granite, and the upper portion of Portland stone. Contained in the block beyond the restaurant there will be three shops, and in the upper portion of the premises suites of offices. The total frontage to the Strand is 104ft. The architect is Mr. Walter Emden, 105, Strand, W.C. The general contractors are Messrs. Holliday & Greenwood, Loughborough Junction. The steel construction is by Messrs. H. Young & Co.

The Architectural Association of Ireland held its annual dinner last Saturday week at Dublin. Mr. C. J. McCarthy, city architect, presided. The chairman proposed the toast of "Our Guests," coupling with it the names of Mr. J. Rawson Carroll (vice-president R.I.A.I.), Mr. James P. Pile (Master-Builders' Association) and Mr. George Coffey. Mr. Pile referred to certain importations in the shape of architects and builders that had recently visited Dublin, and mentioned that lately three large Dublin contracts had been given to architects resident in other cities. He believed that the work could have been done as satisfactorily by men belonging to their own city. Mr. J. Rawson Carroll proposed the toast of the "Architectural Association." The chairman said that though the society had been only six years in existence it had had a very fair measure of success, and had done much for the advancement of the profession.

Working-Class Houses at Whitley Upper, Huddersfield, are proposed to be erected by the U.D.C. at an estimated cost of £1,240. Mr. Joseph Berry, architect, of Huddersfield, has prepared the plans. A Local Government Board enquiry was held last week.

Dairy and Flats, Great Marylebone Street, London, W.—The architects of this building (illustrated on p. 127 of our last issue) are Mr. George Harvey, A.R.I.B.A., and Mr. Henry A. Saul, 5, John Street, Bedford Row, W.C.; not "Saul & Hardy," as previously stated.

Change of Address.—Mr. Delissa Joseph F.R.I.B.A., architect, has removed from 17 and 18, Basinghall Street, to larger offices, with access by lift, at Portland House, Basinghall Street, E.C. The telephone No. 1138, London Wall, and the telegraphic address, "Rebuilding, London," will remain unchanged.

Northern Architectural Association.—The annual report for 1901-02 gives the present membership as 211. The statement of accounts shows a balance of £38 19s. 9d. cash in hand and £50 invested. The work of the students' sketching club was exceptionally encouraging last year. Members are reminded that when travelling to excursion meetings from any station in Northumberland and Durham for distances exceeding 30 miles they can obtain a return ticket for single fare, from lesser distances for fare and a quarter, and at a minimum fare of 9d. in all cases.

The Bristol Society of Architects held its annual meeting last week, Mr. Frank W. Wills, president, in the chair. The following officers and council were elected:—President, Mr. Joseph Wood; vice-presidents, Messrs. G. H. Oatley and F. W. Wills; council, W. L. Bernard, F. Bligh Bond, J. H. La Trobe, Thomas Nicholson, W. S. Skinner, J. Foster Wood; hon. secretary and treasurer, H. Dare Bryan; associate members of council, Messrs. M. A. Green and T. H. Weston. A lecture devoted to architectural research was then delivered by Mr. J. Atwood Slater.

Jules Dalou, the eminent French sculptor, died last week at the age of sixty-four. Dalou had been one of the most prolific and greatest sculptors of the present generation in France. A Parisian, he became a pupil of Abel de Pujol, Duret and Carpeaux, entering the Beaux-Arts in 1853. His first work at the Salon was a *Dame Romaine jouant aux Osselets*, exhibited in 1861. During the Commune, Dalou helped with Barbet de Jouy to preserve the collections, but he was compelled to flee when the regular army entered Paris, and he took refuge in London. He reappeared at the Salon in 1873. The most famous of his works are the bas-relief of the Palais Bourbon, *Mirabeau répandant à M. de Dreux-Brézé, the Triomphe de la République*, placed in 1899 on the Place de la République, the *Triomphe de Silène*, a bronze group to be seen in the Luxembourg Gardens not far from the monument of Delacroix, and a bronze statue, his *Victor Noir*.

The Leeds and Yorkshire Architectural Society held its last meeting of the session last Thursday. Mr. Butler Wilson, F.R.I.B.A., was elected president for a second year, and Mr. R. Wood and Mr. G. F. Bowman were appointed vice-presidents, the former being re-elected. The secretary (Mr. H. S. Chorley) stated that there had been an increase of twenty-six in the membership during the year. The president observed that the aim of the council during the ensuing year would be to give effect to the proposal to provide increased facilities for students, notably in establishing a Chair of Architecture at the Yorkshire College—similar to that at Liverpool. Subsequently Mr. J. Starkie Gardner, F.S.A. gave a lecture on "Decorative Wrought Ironwork." He said that in the sixteenth century the English smiths far outtrivalled their Continental confrères in the design of metal-work, not from any advantages of site or materials, but from an innate love of form which Continental craftsmen, notwithstanding their culture and civilisation, were unable to equal. The age of wrought metal, said Mr. Gardner, had passed. Royalties and municipalities will not now expend the necessary amount so ungrudgingly and lavishly given in the days of Louis XIV. and XV., who expended many million livres upon this one craft. Cast iron and rolled steel have hastened this regrettable decline.

Three Stained-Glass Two-Light Windows have just been erected in Christ Church, Cheltenham, one on the south and two on the north side.

In St. Bartholomew's Church, Bristol, a stained-glass window has been placed as a memorial to the late Queen Victoria. It has been carried out by Messrs. J. Bell & Sons, of College Green, Bristol.

A Ballroom and Arcade at Rhyl are proposed to be erected on the Promenade. The scheme includes a ballroom 100ft. by 54ft., with lounges and open-air balconies, with a large stage capable of accommodating theatrical or variety performances, a cafe, roof gardens and an arcade containing thirty-five shops. The architect is Mr. Charles J. Richardson, of Poulton-le-Fylde, near Blackpool.

A New Coroner's Court has been erected by the Battersea Borough Council on land adjoining the public baths in Latchmere Road, with a frontage of 55ft. to Sheepcote Lane. On the ground floor are rooms for the coroner, doctors and attendant, lavatories, stores, post-mortem room, separate mortuaries for infectious and non-infectious cases, and viewing lobbies. On the first floor is the coroner's court, a spacious and well-fitted apartment, and there is a witnesses' room adjoining.

New Headquarters at Edinburgh are to be erected for the Queen's Rifle Volunteer Brigade. On the ground floor will be an armory with workshop, stores, stabling for service wagons, the orderly and the adjutant's room; and on the first floor the officers' quarters, rooms for company meetings, medical inspection room, and a large, lofty and fully-equipped gymnasium. The second floor is given over to the non-commissioned officers and to the men for whom are provided mess, billiard, recreation- and reading-rooms, with service rooms and lifts to kitchen, which is placed on the top floor. The third floor contains a large lecture hall seated for 320 persons, with retiring rooms, &c., a band room, and accommodation for the quartermaster's stores, the caretaker's house being on the attic floor. The buildings have been designed in the Scottish baronial style, and overlook the grounds of Heriot's Hospital. Messrs. Cooper & Taylor, 14B, George Street, Edinburgh, are the architects.

Masters and Men.

The Strike of Painters at Horwich for an increase of wages from 8d. to 8½d. an hour is practically settled. About half of the employers have conceded the advance and take on all the men on strike. Other employers have imported non-unionists. The employers say some of their number have broken the agreement, and the men resent the presence of non-unionists in the town.

Labour in March.—The Labour Department of the Board of Trade reports that the state of the labour market has somewhat improved during March in most of the important industries, and the general condition of employment is now almost as good as a year ago. Employment in the building trades is better than a month or a year ago. The percentage of unemployed union members among carpenters and plumbers at the end of March was 4.1, compared with 5.9 per cent. in February and 4.7 per cent. in March of last year. Twenty-one fresh disputes began in March, involving 6,285 workpeople, of whom 4,871 were directly and 1,414 indirectly affected. Of the new disputes, three took place in the building trades. The changes in rates of wages reported during March affected 198,499 workpeople, and the nett effect of all the changes was a decrease averaging 1s. 4½d. weekly per head.

OUR INSURANCE SCHEMES.

A Pamphlet, giving full details of the **THREE SCHEMES** will be sent on application to **THE MANAGER, BUILDERS' JOURNAL, EFFINGHAM HOUSE, ARUNDEL ST., STRAND, W.C.**

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
April 24	Arclid, Cheshire—Steam Road Roller Shed	Congleton Rural District Council	A. Price, Architect, Elworth.

" 11	Alexandria, Egypt—Bencon Buoys, &c.	Ports and Lighthouses Administration	Controller-General, Ports and Lighthouses, Alexandria.
" 12	Calcutta—Sand Washers	Corporation	Engineer, Municipal Office, Calcutta.
" 12	Harrowgate—Light Railway	Corporation	E. W. Dixon, 14 Albert St, Harrogate.
" 30	Sydney, N.S.W.—Bridge across Harbour	Corporation	Under-Secretary for Public Works, Sydney.

COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
IRON AND STEEL:			
April 24	Plymouth—Cast-iron Pipes	Water Committee	F. Howarth, Water Engineer, Municipal Buildings, Plymouth.
" 25	Audenshaw, Lancs.—Cast-iron Gully Grids, Manhole.	Urban District Council	W. Clough, 2 Guide Lane, Hooley Hill, Audenshaw.
" 26	Swinton—Wrought-iron Pipes, &c. .. .	Corporation	Borough Surveyor, Town Hall, Swinton.
" 28	Barnsley—Pipes	Corporation	T. & O. Hawksley, 30 Great George Street, Westminster, S.W.
" 29	London, W.—Girder Work	Great-Western Railway Co. .. .	Engineer, Paddington Station.
" 30	Darlington—Steelwork	North-Eastern Railway Co. .. .	W. J. Oudworth, Company's Engineer, York.
May 6	Bradford—Iron, Steel, Bolts and Nuts .. .	Cleansing Committee	E. Call, Assistant Superintendent, Hammerton St. Depot, Bradford.
" 15	Rochester—Cast-iron Socket Pipes, &c. .. .	Corporation	W. Banks, City Surveyor, Guildhall, Rochester.
PAINTING AND PLUMBING:			
April 24	Wolverhampton—Painting, Paperhanging, &c. .. .	Union Guardians	Superintendent, Cottage Homes, Wednesfield.
" 25	Pontefract—Painting and Decorating Chapel .. .	Corporation	Tennant & Bagley, Architects, Pontefract.
" 26	Carlisle—Painting	Union Guardians	H. C. Marks, 36 Fisher Street, Carlisle.
" 28	Chelmsford—Repairs, Painting, &c. .. .	Union Guardians	Master, Union Workhouse, Wool Street, Chelmsford.
" 28	Croydon—Painting &c., at Hospital	Union Guardians	Borough Engineer, Town Hall, Croydon.
" 30	Annan, Scotland—Painting	Union Guardians	J. Laurie, Clerk, Parish Council Chambers, Annan.
May 13	Croydon—White Lead, Oils, Colours, &c. .. .	School Board	B. Rule, Clerk, Offices, Catherine Street, Croydon.
ROADS AND CARTAGE:			
April 24	Houghton-le-Spring, Durham—Materials .. .	Rural District Council	D. Balfour, Surveyor, Houghton-le-Spring.
" 24	Huddersfield—Materials	Whitley Upper Urban District Council .. .	J. Sharp, Clerk, Queen Street, Huddersfield.
" 24	Pentre, Rhondda, Wales—Levelling, &c. .. .	Rhondda Urban District Council .. .	W. J. Jones, Surveyor, Council Offices, Pentre, Rhondda.
" 24	Rugby—Roads, &c.	Benefit Building Society	J. T. Franklin, Architect, Regent Street, Rugby.
" 26	Newmarket—Granite Metalling	Urban District Council	S. J. Ennion, Clerk, Deva Chambers, Newmarket.
" 26	Audenshaw, Lancs.—Materials	Urban District Council	W. Clough, 2 Guide Lane, Hooley Hill, Audenshaw.
" 26	Audenshaw, Lancs.—Road Works	Urban District Council	W. Clough, 2 Guide Lane, Hooley Hill, Audenshaw.
" 26	Bradford—Road Metal	Urban District Council	J. H. Cox, City Surveyor, Town Hall, Bradford.
" 26	Sandwich—Granite, &c.	Corporation	Town Clerk, Sandwich.
" 28	Woodford, Essex—Materials and Stores .. .	Urban District Council	W. Farrington, Surveyor, Council Offices, Woodford Green, Essex.
" 28	Woodford, Essex—Watering Vans	Urban District Council	W. Farrington, Surveyor, Council Offices, Woodford Green, Essex.
" 28	Petworth, Sussex—Materials, &c.	Rural District Council	Council's Surveyor, Fox Hill, Petworth.
" 28	Swindon—Tar Asphalt	Hospital Board	Halliday & Rodger, 14 High Street, Cardiff.
" 28	Uckfield, Sussex—Materials	Urban District Council	C. Dawson, Clerk, Council Offices, Uckfield.
" 28	Walton-on-Thames—Street Watering	Urban District Council	C. J. Jenkin, Surveyor, Council Offices, Walton-on-Thames.
" 28	Whitley, Northumberland—Street Works .. .	Urban District Council	J. Moore, Surveyor, Council Offices, Whitley Bay.
" 28	Woodford, Essex—Materials	Urban District Council	W. Farrington, Surveyor, Council Offices, Woodford Green.
" 29	Isleworth—Roadways	Brentford Union Guardians	W. H. Ward, Architect, Paradise Street, Birmingham.
" 29	Acton—Making-up	District Council	D. J. Ebbetts, 242 High Street, Acton.
" 30	Arundel, Sussex—Flints	St. Mary's Burial Board	A. Holmes, Town Clerk's Office, Arundel.
" 30	Harrogate—Asphalting	Fulham Borough Council	H. Horner, 9 Royal Parade, Harrogate.
" 30	London, S.W.—Making-up and Paving Roads .. .	Rural District Council	F. Wood, Borough Surveyor, Town Hall, Waltham Green, S.W.
" 30	Croydon—Materials	Whitworth Urban District Council .. .	Surveyor, Town Hall, Croydon.
" 30	Facit, Lancs.—Materials	Town Council	T. Biker, Surveyor, Facit, near Rochdale.
" 30	Gravesend—Wood Block Paving	Urban District Council	Borough Surveyor, Town Hall, Gravesend.
" 30	Wood Green—Making-up Road	Urban District Council	C. J. Gunyon, Surveyor, Town Hall, Wood Green.
May 1	London, W.—Road Works	Town Council	C. Jones, Borough Engineer, Town Hall, Ealing, W.
" 2	Ashford, Kent—Broken Granite	Urban District Council	W. Terrill, Surveyor, North Street, Ashford, Kent.
" 2	Eastbourne—Materials, &c.	Rural District Council	T. E. Klotian, 82 Terminus Road, Eastbourne.
" 5	London S.W.—Vans and Trucks	Wandsworth Borough Council	H. G. Hills, Town Clerk, Council House, East Hill, Wandsworth.
" 5	London, N.—Road Works	Hornsey Urban District Council .. .	E. J. Lovegrove, Engineer, Southwood Lane, Highgate, N.
" 6	Hetton-le-Hole, Durham—Materials	Urban District Council	J. Harding, Surveyor, Council Offices, Hetton-le-Hole, R.S.O.
" 6	Windsor—Making-up, &c.	Town Council	Borough Surveyor, Alma Road, Windsor.
SANITARY:			
April 25	Ashby-de-la-Zouch—Sewer	Rural District Council	J. E. Holroyd, 2 Avenue Road, Ashby-de-la-Zouch.
" 25	Audenshaw, Lancs.—Stoneware Pipes, Gulleys, Cement .. .	Urban District Council	W. Clough, 2 Guide Lane, Hooley Hill, Audenshaw.
" 28	Woodford, Essex—Stoneware Pipes, Lime, &c. .. .	Urban District Council	W. Farrington, Surveyor, Council Offices, Woodford Green, Essex.
" 28	Penham, Northumberland—Sewers	Urban District Council	H. W. Taylor, Engineer, St. Nicholas Chambers, Newcastle.
" 28	Sittingbourne—Sewerage Works	Urban District Council	J. O. Melliss, 264 Gresham House, Old Broad Street, E.C.
" 28	Hayfield—Sewers, &c.	Rural District Council	H. Bancroft & Son, 83 Mosley Street, Manchester.
" 29	Malling, Kent—Sewerage Works	Rural District Council	H. Robinson, Parliament Mansions, Victoria Street, Westminster.
" 29	Lanchester—Sewage-Disposal Works	Rural District Council	J. R. Lupton, Surveyor, Lanchester.
" 29	Folkestone—Road and Sewer Works	Corporation	A. E. Nichols, Bor. Engr., Corporation Offices, Church St., Folkestone.
" 29	Stanley, Durham—Scavenging	Urban District Council	J. T. Coulson, Inspector of Nuisances, Stanley.
" 30	Ware, Herts—Sewer, &c.	Rural District Council	H. J. Jackson, Surveyor, Rye Road, Hoddesdon.
" 1	Gateshead—Sewer	Corporation	J. Bower, Borough Engineer, Town Hall, Gateshead.
" 2	Yeovil—Sewerage Works	Rural District Council	J. E. Rodber, Clerk, 30 Kingston, Yeovil.
May 5	Bishop Auckland—Sewers, &c.	Rural District Council	C. Johnston, Surveyor, Crofton House, Bishop Auckland.
" 8	Derby—Sewerage Works	Corporation	J. Mansergh & Sons, 5 Victoria Street, Westminster.
" 13	Richmond—Lime, Sulphate of Alumina, Filter Cloth, .. .	Main Sewerage Board	W. Fairley, Engineer, Kew Gardens.
" 14	Brightlingsea, Essex—Scavenging	Urban District Council	W. J. Osborn, Clerk, Foresters' Hall, Sydney Street, Brightlingsea.
TIMBER:			
April 24	Southampton—Timber	Director-General, Ordnance Survey .. .	Officer in Charge of Stores, Ordnance Survey Office, Southampton.
" 28	York—Sleepers Blocks and Crossing Sleepers, &c. .. .	North-Eastern Railway Co. .. .	Secretary, York.
" 28	Woodford, Essex—Timber	Urban District Council	W. Farrington, Surveyor, Council Offices, Woodford Green, Essex.
May 6	Bradford—Timber	Cleansing Committee	E. Call, Hammerton Street Depot, Bradford.
" 8	Hammersmith, W.—Re-laying Wood Floors .. .	Fulham Parish Guardians	E. J. Mott, Clerk, Fulham Palace Road, Hammersmith, W.

COMPETITIONS OPEN.

DATE OF DELIVERY.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED.
April 30	Glasgow—Branch Library (Local Architects) .. .	—	J. D. Marwick, Town Clerk, City Chambers, Glasgow.
May 1	Melbourne, Victoria—Memorial Statue to Queen Victoria in Marble and Bronze.	—	Agent-General for State of Victoria, 15 Victoria street, Westminster.
" 1	York—Queen Victoria Memorial	£50.	N. H. Andrew, Town Clerk, Guildhall, York.
" 1	Mexborough, near Rotherham—Accident Hospital .. .	£35 £10.	J. Brampton, Fern Villa, Mexborough.
" 14	Harrogate—Town Hall	£150, £100, £75.	A. Bagshaw, Borough Engineer, Municipal Offices, Harrogate.
June 1	Knaresborough—Infectious Disease Hospital	£100, £50.	J. T. Taylor, Municipal Offices, Harrogate.
" 16	Hartshill, Stoke-on-Trent Nurses Home	—	A. E. Boyce, Secretary, North Staffs Infirmary and Eye Hospital, Hartshill.
" 30	Liverpool—Cathedral (Portfolios of Drawings or Design in any Style to be submitted).	—	Ion. Secretary, Committee, Church House, South John Street, Liverpool.
Aug. 30	Sunderland—Police and Fire-Brigade Buildings .. .	£100, £50 £25.	Borough Engineer, Town Hall, Sunderland.
Sept. 1-14	St. Petersburg—Bridges over Great Nava River .. .	—	A. Petersburg Korodskaya uprava, St. Petersburg.
No Date.	Cove, Hants—Orphanage	—	I. G. Warne, Secretary, L. & S.W. Rly. Servants' Orphanage, Jeffrey's Road, Clapham, S.W.

Trade and Craft.

Two New Catalogues.

We have before us the catalogue of Messrs. Adams & Co., of Leeds, and other places so numerous that there is scarcely a district of importance in the United Kingdom where the firm is not represented by showrooms and local offices. The catalogue has a white cover embellished with a tree design in black and red. Besides fifty-five foolscap pages of detailed information of the various specialities, well illustrated throughout, there are separate pages showing actual work done—public conveniences, hotel lavatories, &c., work which Messrs. Adams have executed very admirably. A smaller catalogue of a handy pocket size, though similar in style and appearance, has also been issued. Both contain detailed descriptions of work done in the firm's special "Titanite" ware as well as particulars of the ware itself and its adaptations.

Asphalts.

Messrs. Pilkington & Co., of Monument Chambers, King William Street, London, E.C., issue a useful little pamphlet on asphalt, stating where the different varieties are obtained, their special merits, and how they should be employed. Pyramont Seyssel asphalt, which is generally acknowledged to be the best procurable, is a natural product, a bituminous limestone, procured from the celebrated mines of Pyramont, in the district of Seyssel, in the Jura Mountains, Dept. de l'Ain, France. The rock, after being ground to a fine powder, is placed in large cauldrons with a small percentage of natural bitumen (in some asphalt a large percentage of heavy oils is substituted for natural bitumen in order to reduce the cost, thus rendering the material unreliable and less durable), and when brought to a temperature of about 350° Fabr. is stirred by machinery until thoroughly amalgamated and reduced to a mastic state. The mass is then run into moulds and cast into cylindrical cakes, with the brand embossed on side and top. This material, which has been almost exclusively used on all Government works, is specially suitable for covering flat roofs and terraces, and also for paving corridors, courtyards, tennis courts, malt floors and for brewery work generally. It is also very well adapted for lining reservoirs, tanks, swimming baths, aquaria, &c. Limmer asphalt is a natural product procured from the mines in the neighbourhood of Limmer, Hanover. It is prepared and treated in the same manner as Seyssel, to which it is similar, but is considered inferior to that material for most purposes; it is, however, somewhat cheaper. Polonceau asphalt is manufactured solely by Messrs. Pilkington from an analysis of Seyssel asphalt, and contains the same component parts, though it is considerably cheaper. Polonceau asphalt is very suitable for paving cartways and approaches to warehouses, &c.,

where very heavy traffic occurs. In this case it is made harder than usual and is laid 3in. thick, the first layer being composed of asphalt-concrete 2in. thick, with 1in. of fine asphalt laid on top. Polonceau asphalt has been tested for thrusting stress by Messrs. Kirkaldy & Son with very satisfactory results. Lava asphalt is a good ordinary British variety, and is suitable for similar purposes to Polonceau asphalt in cases where it is necessary to reduce the cost to the lowest limit. White silica asphalt is suitable for paving corridors, terraces, &c., or for lining ornamental fountains, &c. Messrs. Pilkington have also introduced a patent acid-resisting asphalt, which is specially suitable for laboratories, battery-rooms of electric-light stations, &c.

Roof Trusses.

Roof trusses on Holt's system—equi-sided and saw-tooth, steel and timber combined—are supplied by Messrs. Andrew Handyside & Co., Ltd., of Derby and London. The rafters and struts are of timber, the tee-rods of steel, and the connections of cast-iron, and the advantages claimed for this construction are (1) that the cost is small, (2) that the truss can be fixed by unskilled labour and is very portable, (3) that it is much stronger and lighter than an all-timber roof and cheaper than an all-steel one. The principle is one which can be used most advantageously in the construction of roofs for workshops, mills, factories, &c.; the roof can be covered with corrugated sheeting, boards and slates, or with boarding, felt and glass, as circumstances demand; moreover it is well adapted for export, the iron connections being packed for shipment and the timber supplied abroad to suit them. The cost of a 20ft. span is £1 7s. for ironwork and 15s. for timber, for a span of 30ft. £1 10s. 6d. and £1 5s. respectively, for a span of 40ft. £3 7s. and £1 12s. 6d., and for a 50ft. span £4 18s. and £3 2s. The London offices of the firm are at 104, Queen Victoria Street, E.C.

Earle's Cement.

Messrs. G. & T. Earle, Ltd., of Wilmington, Hull, send us a copy of their new catalogue giving particulars of the tests made to secure a trustworthy cement. Messrs. Earle offer a special advantage in this respect in their "Lead-Sealed Pelican Brand," for practically every bag sent out of the works is tested, samples being taken from every two tons made. Every bag is guaranteed and has a lead seal attached to a coloured tag, a different colour being used for each month, so that it can be seen at once what month the sack was filled in. Tests made by Messrs. Henry Fajia & Co., 41, Old Queen Street, Westminster, London, S.W., of their day-by-day manufacture for October, November and December 1901 show that the difference between their seven days' tensile strain test, neat cement, on lin. section (one day in air, six days in water), is only that between 883lbs. for the day-by-day manufacture for November and 866lbs. for the day-by-day

manufacture for October, a difference in all of 17 lbs. on the month's manufacture, and that for the three months there is only 43lbs. difference between the highest and lowest seven days' test in October, November and December, namely 866lbs. for October and 909lbs. for December. As few engineers' and architects' specifications ask for more than 400lbs. tensile strain upon the lin. section (one day in air, six days in water), and never exceed 500 lbs., there is a considerable margin. A remarkable testimonial to the quality of Earle's cement is afforded by the Corporation of Salford having used 15 parts of broken brick to 1 of cement.

COMING EVENTS.

Wednesday, April 23.

INSTITUTION OF CIVIL ENGINEERS (Special Meeting: Tenth "James Forrest" Lecture).—Sir William Chandler Roberts-Austen on "Metallurgy in relation to Engineering," 8 p.m. Students' Visit to the Works of the Great Northern and City Railway in course of construction, at 2.30 p.m.

SOCIETY OF ARTS.—Professor Silvanus P. Thompson, D.S.C., F.R.S. on "Opto-Technics," 8 p.m.

An Architectural Causerie.

The Coronation:
Stands and
Balconies.

THE terrible fatality at Glas-
gow has doubtless impressed
on the authorities the necessity
for the strictest regulations to

be observed with regard to the very large number
of stands erected for the Coronation. Since the
change in the government of the Metropolis, the
borough councils are now responsible for the
stands in their own particular districts; but the
safety of balconies rests with the Council. In view
of the fact that not a single accident occurred in
1897, when the Council was responsible for the
stands then erected, and that the Westminster
City Council has decided to engage four qualified
assistants to supervise the erection of wooden
stands in that district, there is no fear of any
laxity in assuring the safety of these structures:
but we would particularly urge that the Council
make every effort to prevent catastrophes caused
by defective balconies. On the procession days
all balconies commanding a view of the route
will be crowded, and many of them will not
have been used for some time: so that a
thorough inspection should be made to avoid
accidents like that which occurred at Man-
chester on the occasion of Lord Roberts's visit.
This is a very important matter demanding the
closest attention.

By the Side of
the Thames.

SURELY it is astonishing that
the London County Council's

Bill authorising the construc-
tion of an electric tramway along the Embank-
ment should only have been passed in the
House of Commons by a majority of nineteen!
Doubtless the opposition members followed pre-
cedent, for the proposal had already been
rejected nine times by the House: yet, when
the actual facts are considered, what a lot of
nonsense has been circulated about this new
tramway. While being thoroughly alive to any
attempt at "vandalism," we cannot side with
those persons who live in the past, utterly
neglect their own times, and consequently are
in a more or less chronic state of æsthetic fever.
Why should there not be tramways along the
Embankment? They will afford considerable
facility of communication between Blackfriars
and Westminster Bridges: and, as the conduit
system will be adopted, they will be quiet and
unobtrusive. Had the proposal been to adopt
the overhead system there would have been
some reason in opposing the scheme, for we do
not wish a repetition of the caging-in of streets
after the manner of the Chiswick High Road
and other branches of the same system. Certain
persons invariably oppose every innovation,

while others are so blinded by modernism that
they are equally unappreciative of the past.
Both extremes are wrong. Neither embraces a
generous view and the resultant can never be
so useful or effective as a thoroughly moderate
opinion. We can never expect any advance
from those who hug the past and neglect the
present, yet this is the class that has been
"æsthetically" raging about the Embankment
and its impending destruction by the tramways.
We are therefore glad that their aim has missed
its mark.

Warehouse Fires. If a large uninterrupted
window is demanded, plate
glass is the material exactly suited to require-
ments, and, provided the latter are just, there
can be no logical objection to plate glass so far

A Master of
Language.

SOME master-builders are won-
derful linguists, in which re-
spect they resemble barges

and offended cabmen. Their language, like the
atmosphere of the Underground, is sulphurous:
and, if report speaks truly, a certain master-
builder of Birmingham possesses this charac-
teristic in a most marked degree. A short time
ago he paid an early-morning visit to a house
which he was repairing in Edgbaston, and —
strange — found his men not laying so many
bricks as their friends at Manchester, and one
of them in particular so thorough in his respect
for the "ca' canny" doctrine that the irate em-
ployer spoke as a master-builder can, on occa-
sions, speak. Though an orator, his language was
hardly that of Demosthenes: indeed, it is hinted
that the foreman referred to the crumbling

CHIMNEY-PIECE FOR DR. H. O. TAYLOR. BREWILL & BAILY, ARCHITECTS.

as light is concerned, because it admits the
maximum amount in a given space. But the
question of fire in a building of the warehouse
class is even more important than that of light,
and, if need be, some sacrifices or compensations
must be made on its behalf. In large windows
glazed with one sheet in the ordinary way the
glass cracks the moment the flames strike it:
and thus the fire spreads. Hence, in the all-
important particular of fire-stoppage, the glass
fails. The recent disastrous fire in Barbican
exemplified this, and emphasises the necessity
to avoid large openings glazed in single sheets
and to adopt smaller panes, preferably of
wired glass: also, to use iron frames instead of
wooden ones, and, in special cases, to employ fire-
resisting shutters or blinds. It is becoming
increasingly evident that everything must be
done to prevent the spread of fire: to keep it
localised: and one way towards this end is to
abandon great windows in wooden frames glazed
with single sheets of ordinary plate glass.

effect of certain atmospheres on building
materials. However, the men were not shocked;
but the lady of the house overheard, without
knowing who was the speaker. The master of
the house, in righteous indignation, fiercely told
the foreman that no man should swear before
his wife and that he demanded the immediate
dismissal of the offender, whose presence could
not be tolerated on the premises: and the fore-
man, being a wit, suggested that if the good
lady would have preferred to swear first, doubt-
less the request would have been observed.
Matters had now become complicated, but a
happy solution was found by feigning to dismiss
a man—the master-builder's scapegoat: yet
what a moral lies here for builders!

The Chimney-piece illustrated above is an
addition to an old house, as will be seen by the
plaster cornice to the room. It is of deal painted
white, and the interior of the grate is built with
"Lethaby" green bricks, with Siena marble slips.

GEORGE'S DOCK SITE, LIVERPOOL.

THE LAYING-OUT OF THE NORTH SIDE.

AT the annual meeting of the Liverpool Architectural Society (Incorporated) held last week the following officers were appointed for the fifty-fifth session:—President, Mr. John Woolfall; vice-presidents, Messrs. T. E. Eccles, A.R.I.B.A., and P. C. Thicknesse; hon. secretaries, Messrs. Hastwell Grayson, A.R.I.B.A., and Gilbert Fraser, A.R.I.B.A.

The chairman (Professor Simpson, the retiring president) invited a discussion on the laying-out of the north side of the George's Dock site, observing that he was sure they would all realise the importance of the matter. It was dealing with one of the most important sites in the city, and one that concerned everybody, but especially architects. Mr. W. E. Willink explained the proposal of the Council of the Society. The Corporation had already decided as to the nature of the buildings on the south and Gorie sides; and no objection was offered to these. In regard to the north side, however, the Council suggested that a block of buildings should here be erected which would be of a size sufficient to balance the Dock Board offices on the south side. To do this it would be necessary to cover more ground than was represented by the remaining portion of the old dock site, in the direction of the inclined way. Mr. Willink expressed the opinion that most of the traffic down Water Street and Brunswick Street to the Landing-stage would in future travel along the new extensions, so that any encroachment on the roadway at the north side would not interfere with the traffic.

The chairman announced that the Estate Committee of the Corporation had been written to, asking them to allow a deputation of the Society to lay the views of the members before them, and although no formal consent had yet been received he understood that the Committee were willing to receive the deputation. The opinion had been expressed that nothing should be built on the north side at all, and that it should be left absolutely open. The Council had carefully considered the matter, and had come to the conclusion that a big block such as the Dock Board offered on the south side, and a lofty block behind, with possibly a smaller block in front, would not look satisfactory, and that a dignified effect was more likely to be attained if a good-sized block were erected on the north side corresponding in size to the one on the other side.

After discussion, the following resolution was adopted: "That this meeting approves of the suggestion of the Council of the Society that the whole space, or as large as possible, be left open between the continuation of Water Street and Brunswick Street, and that a wide block be built on the north of this to balance the Dock Board offices." It was further resolved that Professor Simpson and Messrs. P. C. Thicknesse and Arnold Thornely constitute a deputation to wait upon the Estate Committee of the Corporation.

On Saturday, April 19th, the members of the Society paid a visit to Hawarden. Mr. Minshull met the party at the station, and conducted them to the new Gladstone Memorial Library, now being erected from designs by the firm of Douglas & Minshull, of Chester. The building is Gothic in design, richly carved and moulded. It is built of Runcorn and Helsby stone, and roofed with green Coniston slates. In accordance with Mr. Gladstone's own wishes, the library proper is divided into two parts—the larger to contain the books on humanity, and the smaller those on divinity. Each room is two storeys in height, with an open carved oak gallery and an oak roof. In addition there are rooms for the staff and for special study, and a residential wing will be added eventually. The books will be arranged on the same principle as those arranged by Mr. Gladstone in the temporary iron building adjoining. The members of the Society were much struck by the great economy of space afforded by the design of the bookcases. Visits were afterwards paid to Hawarden Church, where a vaulted side chapel is in course of erection, and to a new church at Shotton, designed by Messrs. Douglas & Minshull, and erected to meet the wants of that growing mining district.

The Embankment Lamps at Highgate.—The London County Council have adopted the dolphin lamp on the Embankment (by Vulliamy) for the new Highgate Archway!

STATUE OF GOETHE IN VIENNA. PROFESSOR HELLMER, SCULPTOR.

TWO GERMAN STATUES IN VIENNA.

BY ALFRED W. FRED (Vienna).

MONUMENTAL art has undergone great changes during the last few years. The old style had lately acquired the appearance of model work. Until very recently no man had dared to give an individual expression to a head and to impress it with a fresh, characteristic inspiration—even in France, the land of the plastic, a work like Rodin's "Balzac" had to encounter a storm of objections a few years ago. The two monuments that have been added to Vienna during the past year give a good idea of the development of monumental art. By far the more striking of the two is that of Goethe, by Professor Hellmer, of Vienna. This work shows forth the confident, enlightened thinker, far ahead of his time: for all ages a marvellous representation of universality; the restless, creative poetic genius. One can see in it the idea on which the sculptor laid particular stress. There are the comfortably-placed well-shapen free limbs, the control of the fine hands, and the Olympian equanimity of expression. The architectural portion of the monument is simple, all interest being concentrated in the figure itself. The monument is cast in yellow bronze, and is much larger than life-size.

Much less simple, and therefore less effective, rather fanciful than artistic, is the other new Vienna monument of Gutenberg, the inventor of the art of printing. It is by Hans Bitterlich who was the prize-winner in the competition held. Gutenberg, patrician of Nuremberg, as is known, is represented in the garb of his time, one leg placed forward, with one hand set in his side and the other resting on a chair. The left foot, without apparent object, projects over the base. The first sketch showed, instead of the chair, a hand printing-press, which was a good symbol. This monument also is cast in bronze and is more than 3 metres high. The artist has sought to represent Gutenberg as a thin grief-stricken man. This characteristic representation strikes me as at least superfluous. What one misses is any artistic and direct hint as to the reason why he should, after a lapse of 500 years, have a monument. Even the reliefs on the pedestal, which is of granite below and light yellow marble above, have no intimate connection with Gutenberg. The inscription and some descriptive matter are very necessary to enlighten the curious beholder. The effect of the monument from a distance is, however, praiseworthy.

STATUE OF GUTENBERG IN VIENNA. HANS BITTERLICH, SCULPTOR.

SOME ANCIENT HAMPSHIRE PALACES.*

By S. W. KERSHAW, M.A.

FROM the title of this paper more perhaps may be expected than can be gathered even from treasured archives or from what remains of these once important manor-houses of the see of Winchester; for, with the exception of Wolvesey Castle, at Winchester, the other buildings are but fragments.

Winchester was early of architectural importance, and we read, "Under Alfred's fostering care Winchester became the home of all the learning and the arts known in that day, and rivalled the earlier splendour of the court of Charles the Great at Aix-la-Chapelle." The artistic activity of Winchester was also seen in the foundation of Hyde Abbey near the city, where some of the choicest examples of illuminated manuscripts were produced. Later, we find this mediæval city the focus of trade and industry, and in Winton Domesday the names of the chief citizens, the franchise and the liberties of this powerful city are recorded. It was also a royal residence. An attempt was made by Charles II. to revive the ancient glories, for he determined to build there a palace which should rival the splendour of Versailles, and commissioned Sir Christopher Wren to secure a site which would have commanded a stately approach to the cathedral—fair terraces and steps were to lead thither—and a very royal structure would have risen had not the king's death in 1685 arrested the whole design. The house was never inhabited, and was afterwards used as barracks till a great part was lately destroyed by fire.

In addition to the architectural history of Winchester and Hampshire, when we consider its prelate-builders a review of their lives and works cannot but form a chapter in our studies. From the first Norman bishop, Walkelin, in 1079, who rebuilt the cathedral; Bishop Henry of Blois, to whom the castles of Farnham, Wolvesey, Merton and others owe their origin; to the famous William of Wykeham, followed by Bishop Waynflete, and, after the Commonwealth period, by Morley, the restorer of Wolvesey and Farnham; a series of illustrious craftsmen is presented to our notice whose influence reached even to the small village churches.

Wolvesey.

When William of Wykeham was bishop there were ten or twelve different castles, manor-houses and places of residence in Hampshire. Of these Wolvesey claims the first rank. Dean Kitchin says: "At Wolvesey Castle, with the help of the brethren of St. Swithin's Convent, the earlier part of the Anglo-Saxon Chronicle was compiled and copied." In the twelfth century we may fix the foundation of Wolvesey as the "palace" with "a very strong tower" built by Henry de Blois, the architect-bishop who erected portions of Farnham Castle. Leland calls Wolvesey "a castle or palace well fortified, and the old walls extended almost to the city bridge, being fortified with towers at proper distances," a statement endorsed by Camden, who wrote: "It was very spacious and surrounded with many towers." One famous name, William of Wykeham, is prominent as having repaired Wolvesey, and from having lived there in much splendour. Called from his native place, Wickham, near Fareham, in Hants, he was pre-eminently an architect-prelate, having built Queenboro' Castle in the Isle of Sheppey and Winchester College, while his work at Winchester Cathedral and other places would alone signalize his skill. It does not appear that his architectural knowledge developed before his twenty-third year, when he was in King Edward III.'s service and made clerk of all the royal manors, and the patent for that office was conferred on him in May, 1356, followed by the surveyorship of the king's works at Windsor. Wykeham rose more and more in favour—"Everything," says Froissart, "was done by him, and nothing was done without him." In 1368 he was enthroned Bishop of Winchester, and, as such, speedily issued orders to have all the castles, manor-houses and palaces belonging to the see

repaired. The Hospital of St. Cross, near Winchester was restored by this prelate. His great work, the founding of New College, Oxford, was accomplished in 1380, and the building was finished in six years. That Winchester might be connected in learning with Oxford, this princely prelate founded that famous college in his cathedral-city. In his seventieth year he began the greatest of his works in Winchester Cathedral. He rebuilt the nave, and engrafted the elegant Gothic on the earlier work, still retaining the strength and outline of the solid masonry. The picture gallery at Farnham Castle has a fine portrait of him. Wykeham was succeeded by William Waynflete, who was educated at Winchester and Oxford, and founded Magdalene College in that city. In 1438 he was made master of St. Mary Magdalene Hospital, in Winchester, and Henry VI. afterwards made him master of Eton. Much intercourse took place between the college authorities and Waynflete as to architectural matters, the former visiting the bishop four times a year, accompanied by the chief mason, the carpenter, and Walter the carver. "The Bishop to supply all materials, pay for all

have been attributed, without evidence, to Albert Direr.

The Civil Wars raged fiercely in Hampshire, and the old palace of Wolvesey was destroyed, or nought left but a few walls. The ancient castle near the entrance to the city was also dismantled in that dire siege, which devastated the country all around Winchester. With the Restoration a new era dawned. Bishop Morley was then the prelate of St. Swithin's See. He began rebuilding the structure, and employed Sir Christopher Wren for that purpose. Bishop Morley is also known as having repaired Farnham Castle, and he rebuilt the present chapel of that historic pile. The last to improve Wolvesey was Bishop Trelawney (1707-21), who added one of the wings and made many internal alterations.

Bishop's Waltham.

Of this palace, Leland wrote: "Here the Bishop of Winchester has a right ample and goodly manor-house, moated about, and a pretty brook running hard by it." The palace was built by Henry de Blois; succeeding prelates added to or improved the house, especially

STABLE, "OAK LEA," NEAR LEEDS. BEDFORD AND KITSON, ARCHITECTS.

labourers, and to provide lodging for the said Water and all his servants." Though Waynflete's share in the Eton buildings was great, Professor Willis remarks that his work was confined to the church.

At Esher are the remains of Wolsey's Tower (or gatehouse) of the palace built for that Cardinal by Bishop Waynflete—"the stately mansion of brick"—between the years 1450-80, a building which in Wolsey's time must have recalled a small portion of Hampton Court: nought but the picturesque tower overlooking the River Mole now remains. In the eighteenth century great changes were made to Esher Place by Kent, the architect of the Horse Guards, in re-modelling, insertion of windows, &c., and this took place during the tenure of Henry Pelham, the statesman; after his death the house was pulled down.

Another prelate, Bishop Fox, lived much at Wolvesey, and is commemorated by his exquisite chantry tomb in Winchester nave, as well as by the erection of the famous altar-screen in St. Saviour's, Southwark, near the once standing Winchester House, the London home of the bishop of that see. The roof of the present choir of Winchester is attributed to this prelate, and was decorated by him about the year 1502. As one of the executors of Henry VII. and Lady Margaret, he had much to do with the building of St. John's College, Cambridge; also King's College in that university. The designs of the stained glass in King's College Chapel are attributed to Bishop Fox, by the direction of Henry VIII., in 1515. By some the windows

William of Wykeham. To this day the great hall can be traced, its five large windows shrouded in ivy, together with a ruined tower adjoining. The building did not escape the Civil War period; in March, 1644, preparations for an assault were made, terms of surrender were agreed on, but in a few months afterwards the palace was almost a ruin.

Bishop's Waltham Church, in the neighbourhood, claims a word as having had in some part of its design the work of Bishop Blois and of William of Wykeham in the chancel, the east window of which has his well known badge of the rose, seen also in the church at Meonstoke in Hampshire.

Merton.

Merton, four miles south-west of Winchester, was an occasional residence of the Bishops of Winchester, built and fortified by Henry of Blois circa 1138—all that is now left are a deep wall and some ruins in Hursley Park.

A fragment only of a flint tower remains of the whole structure; the castle was in ruins in the fifteenth century. It was built on an island of chalk down, shut in by trees. The fragment still standing is believed to be part of the northern gateway tower, and the entrance would have been by a drawbridge.

Another manor was Highclere, alienated from the see of Winchester in 1551 by Bishop Poyntet.

In connection with my subject I may mention the churches of East and West Meon, well known to most architects for their Norman work. East Meon was one of the bishops' manor-

* Summary of a paper read before the Society of Architects on Thursday, April 24th, 1902.

"WEETWOOD CROFT," NEAR LEEDS: SOUTH FRONT. BEDFORD AND KITSON, ARCHITECTS.

houses, and the remains (now a farmhouse) may be seen opposite the church gate. The brick walls and arches of this once former palace are still standing.

Farnham.

Farnham Castle, though on the Hampshire border, may surely be included in the list of ancient palaces, especially as the seat of the see and diocese of Winchester, and can therefore form an appropriate close to this paper. Of the original fortress, built in 1136, by Henry de Blois, little remains save the keep and the servants' hall with its circular pillars, formerly the castle chapel. We need but recall the siege of Basinghouse, not so far distant to learn what havoc war was making in this district. This famous fortress stood a siege of four years, and but a few fragments of the old house remain—the gateway, ivy-covered walls and terraces overgrown with brushwood. After the Restoration Farnham Castle entered on its renewed life, repaired and improved by Bishop Morley, who held the see of Winchester from 1662-84. The bishop had largely given to the repair of Winchester Cathedral and to his palace at Wolvesey; but he laid out £8,000 on Farnham, and annexed Winchester House, Chelsea, to the diocese as the town residence for the bishops. The present private chapel erected by this prelate has some interesting features. The wealth of carving by Grinling Gibbons cannot escape notice. The entrance porch of the castle,

of red brick, was built by Bishop Fox, and is known as Fox's Tower, embattled with octagonal turrets. Over the entrance of this tower is a sun-dial with the motto: *Imputantur prætereunt.*

"Weetwood Croft" and "Oak Lea."—A ground plan of "Weetwood Croft," near Leeds, was published in our issue for June 21st, 1899, in which issue also appeared a perspective, reproduced from a pencil drawing by Mr. C. E. Mallows, F.R.I.B.A. Another perspective drawing by Mr. F. L. Griggs was also illustrated in our issue for May 25th, 1898. The house is built entirely of local stone, and the roof was intended to be covered with stone slabs, but by the owner's wish red tiles were used instead. The parapet of the porch is carved with vine, grapes, birds, and butterflies; the knots under it are carved with different flowers, and on the sundial are carved wild roses and the motto "True as the Sun." All the principal rooms have oak floors and the hall is panelled to door height. Mr. Francis W. Bedford, F.R.I.B.A., was the architect.—"Oak Lea" is a small stable designed by Messrs. Francis W. Bedford, F.R.I.B.A., and Sydney D. Kitson, M.A., of Greek Street Chambers, Leeds, for Mr. S. M. Bryde. It has a coach-house, harness-room, one stall, and one loose-box on the ground floor, with loft over. It is built of local stone with red-tiled roof. It was erected in 1898.

"WEETWOOD CROFT," NEAR LEEDS: VIEW FROM THE SOUTH-WEST.

METALLURGY & ENGINEERING.

THE ARCHITECT-ENGINEER.

BY SIR WILLIAM ROBERTS-AUSTEN,
K.C.B., F.R.S.

AT a special meeting of the Institution of Civil Engineers held on April 23rd the tenth "James Forrest" lecture was delivered by Sir William Roberts-Austen, K.C.B., F.R.S., Hon. M.Inst.C.E., the subject being "The Relations between Metallurgy and Engineering." The lecturer quoted Mr. G. P. Bidder, who, in his presidential address to the Institution delivered in 1860, said "that if he were called upon to define the object and scope of the profession of civil engineer, he would say that it was 'to take up the results discovered by the abstract men of science and to apply them practically for the commercial advantage of the world at large, and to diffuse their beneficent influence among all classes of his fellow citizens.'" He hoped to be able to show that metallurgists practising an industrial art had helped the engineer to do this, and in evidence that such was the case he quoted from the presidential address of Sir John Fowler words to the effect that engineers had been more assisted by members of the Institution and by distinguished men of science generally in relation to iron and steel than as regarded any other material. The relations with which the lecture dealt had been strangely stimulated by the intervention of men who, in many cases, were neither engineers nor metallurgists, but were men whose lives had been devoted to abstract science. Such men recognised the value of certain metals and alloys for definite uses, they investigated their mechanical properties, and proclaimed their merits to engineers. The intervener then disappeared, leaving behind some coefficient or constant bearing his name by which he was gratefully remembered. As an instance, Galileo's estimation of the tensile strength of copper cylinders and Young's determination of the rigidity of steel (which had resulted in Young's modulus) were cited.

It was not easy to fix the period in industrial history at which the metallurgist began to give the engineer material assistance. If in this country Stonehenge were taken as a starting point, the architect-engineer who designed that crowning example of neolithic art could not have received any assistance from the metallurgist. That stately structure arose from the plain at a time when bronze tools were known but were not in general use, and this period had recently been fixed by Mr. Gowland at about 2,000 B.C. In another phase of engineering work it was known that Rome, in the days of her occupation of this country, trusted to the metallurgists of our island to supply the lead which was so extensively used in the Eternal City. The fourth-century wrought-iron column discovered in India, and the girders and beams of the Orissa temples, rendered it necessary to exercise great caution as to the period at which iron was used in construction. Such magnificent efforts as those given were, however, not maintained, and no widespread or continuous records of the metallurgists' contributions to early constructive work could be presented. On the other hand, the civil engineer had, to quote the Charter of the Institution, "advanced mechanical science and directed the great sources of power in Nature for the use and convenience of man" for ages before the metallurgists rendered more than incidental service.

As examples of great engineering works into the construction of which no metal entered the lecturer referred to and gave illustrations of the primitive cantilever bridges of pine trees used to cross mountain torrents in Savoy. The interesting thirteenth-century cantilever bridge made up of 20ft. beams given in the note-book of Villars de Honnecourt was also shown, as was a bascule bridge of the Middle Ages. The dome of Milan Cathedral, as designed by Leonardo da Vinci, the great Tuscan painter, engineer and architect, was also referred to as an example of a structure in which metal was not used. The employment of cast-iron from the time of Queen Elizabeth to the present day was then dealt with, and the proposed cast-iron bridge of 600ft. single span by Telford and Douglas was

"WEETWOOD CROFT," NEAR LEEDS: HALL AND STAIRCASE.

referred to, and it was pointed out that in the nineteenth century metallurgists, by creating the age of steel, more than atoned for their somewhat tardy and intermittent efforts to supply engineers with suitable materials.

As regarded the use of cast-iron and malleable iron, it was admitted that the necessity for pumping water out of mines was the main factor in the evolution of the steam-engine, and, in turn, the development of British metallurgy of iron and steel dated from the time when the steam-engine of Watt enabled air to be readily pumped into the blast-furnace employed for the production of cast-iron. It was then pointed out that more than half of the last century had elapsed before the "age of steel" began, and that towards the end of the century great attention was devoted to considerations connected with the molecular structure and properties of steel, and to enforcing the action of carbon—the element which gave steel its properties—by the addition of other elements than carbon in very small proportions. With regard to the slow growth of confidence in the qualities of steel, the opinion of successive presidents of the Institution, as expressed in their addresses, was quoted; in 1887, when Sir George Bruce delivered his address, the merits of steel had at last received recognition, and as regards the crowning triumph of the age of steel—the Forth Bridge—Sir George exultingly exclaimed: "At the Menai Bridge the total quantity of iron was 11,468 tons; at the Forth Bridge there will be 50,000 tons of steel and iron." No one had done more than Sir Benjamin Baker to insist on the importance of phenomena which engineers used to consider "mysterious" in connection with the behaviour of steel, and his warnings and example were at last being regarded and followed. The lecturer pointed out that when metallurgists gave engineers mild steel they provided a cinder-free solid solution of iron and carbon. All subsequent advance had been due to the recognition of this fact and to the gradual study of the properties of metallic solid solutions. Sir John Hawkshaw, in his presidential address to the Institution delivered in 1862, had said that if the strength of iron could be doubled the advantages might be equal to the discovery of a new metal more valuable than iron had ever been. The lecturer contended that this was exactly what metallurgists had done with regard to steel.

In conclusion, he appealed to the new Alexander III. Bridge at Paris as showing the need for the careful measurement of high temperatures in connection with the treatment of large masses of steel. In the construction of the bridge 2,200 tons of cast steel had been employed and a peculiar molecular structure was imparted to the steel by rapidly cooling it in air from a temperature of 1,000° C. to 600° C.; this gave the metal certain mechanical properties which it would not otherwise have possessed.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

REFERENCE is made in the annual report for the past year to the new draft by-laws of the Leeds Corporation. These were considered by the Society and various alterations suggested, but the authorities were not disposed to consider them or to grant an extension of time in which the Society might discuss the by-laws. When the Local Government Board inspector appears in Leeds to hear objections the Society will give evidence in support of their views.—The Council objected to the assessor for the new baths at Bramley and York Road, Leeds, nominated by the Leeds city authorities, on the ground that the assessor in such a competition should be an expert in the design and construction of baths. They also named some architects who would meet with their approval if appointed to the post. The assessor, though verbally expressing his willingness to refer the matter to the Leeds Town Clerk, refused to withdraw from his appointment and awarded the premiums. The Council then laid the correspondence with the assessor before the Council of the R.I.B.A., asking them to endorse their action. This the Institute refused to do, stating that they considered it

sufficient that an architect on being appointed an assessor in any competition should make such enquiries as would qualify him to judge of the merits of the designs submitted, whether he were a specialist in the particular kind of building to be erected or not. The Council of the Society wrote to the Institute saying that they could not agree with them in their decision.—During the year the Society's first Green Book, compiled and edited by the president for the year, was published.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual report of the Council for the session 1901-2 refers to the alteration made in the rules to bring the electoral year more into line with that of the R.I.B.A. The annual meeting has been changed from the third Tuesday in October to the third Tuesday in April: so that the present report really only deals with a half-year session. The members now on the roll number seventy-two. The Photographic Collection Committee have completed the set of architectural photographs brought together in connection with the Glasgow Exhibition, illustrating the architecture of Glasgow from the cathedral down to buildings of the most recent times. The total expense is not expected to exceed £20. The photographs may form the nucleus of a larger collection, in which all the works of architectural interest in Glasgow and the West of Scotland will be included. Space has been provided for such an extension, and members and other architects are invited to present photographs of buildings erected from their designs and coming within the category mentioned. The offer of such contributions should, in the first place, be intimated, with information regarding the building illustrated, to the secretary for submission to and approval by the Council. Photographs should be printed and mounted in conformity with those in the collection already formed. The ninth triennial competition for the Alexander Thomson Travelling Studentship is to be held this year, the drawings to be lodged with the secretary by December 26th, and the Council are glad to report that the individual applications for copies of the programme have far exceeded their expectation, based on former competitions, as these already number upwards of seventy and have come from all parts of the Kingdom. The Council regret they have nothing to add to the statement in their last report with regard to the Glasgow Royal Infirmary competition. The revenue account shows a balance in hand of £10 13s. 9d.

In St. Olave Church, Exeter, new oak chancel and parclose screens have been erected by Messrs. Harry Hems & Sons, of Exeter.

"WEETWOOD CROFT," NEAR LEEDS: FIREPLACE IN HALL.

SOCIETY OF ARCHITECTS.

ANNUAL DINNER.

THE eighteenth annual dinner of the Society of Architects was held on Friday evening last in the banqueting hall of Princes' Restaurant, Piccadilly, W., the president, Mr. Silvanus Trevail, F.R.I.B.A., J.P., presiding. The company numbered about 150, and included Alderman Sir William Treloar, Lord Monkswell, Sir William Richmond, K.C.B., R.A., the Bishop of Southwark, Archdeacon Sinclair, the Hon. W. F. Massey-Mainwaring, M.P., Sir Wyke Bayliss, F.S.A., Mr. T. P. O'Connor, M.P., Mr. Edward Terry, Mr. Alfred Darbyshire, the mayors of several London boroughs, the presidents of various associations, and managers of large railway and shipping concerns. After the royal toasts had been given, Sir William Richmond proposed the toast to "Ministers of Religion," in doing which he referred to the fact that in the past the ministers of religion had also been the ministers of art: it had been so in Egypt, where, under the Theban dynasties, the priests had regulated the artists. The practice had been followed in later times, but, happily, we were now free of it, and it behoved ministers of religion, instead of embarking into periods out of our cognizance, to identify themselves with the leading artistic movements of their time. In these days we could not repeat the methods of popes who impoverished the people to build a new Rome, and we needed to diminish the excrescences on our buildings and meet the demands of the church by simplicity and proportion. It was not the slightest use to hark back. We had to construct in iron and steel, and the greatest architects would be those who best conformed to the requirements of the day. The Bishop of Southwark and Archdeacon Sinclair responded. The latter said that there had always been the greatest harmony between the authorities of St. Paul's Cathedral and Sir William Richmond in regard to the decorations. He mentioned the proposal to rebuild the parish church of Islington, plans for which had been prepared by Mr. Reginald Blomfield. These would cost £30,000 to execute, but, for financial reasons, the amount had to be cut down to £20,000. He regretted this and had done his utmost to prevent it, and in this connection he pointed out that it was not absolutely necessary for one generation to build the whole of a church in a year—it was better to have a really good plan and build as much of it as we could. In conclusion he said that it had always been a dream of his that Wren's earlier design for St. Paul's should be carried out somewhere. As could be seen from the model they possessed, it was a more beautiful design than the existing building, and Wren abandoned it under compulsion with great regret.

The next toast was that of "The Houses of Parliament," proposed by Mr. Frank Dodd, barrister-at-law, and responded to by Lord Monkswell, Mr. Massey-Mainwaring and Mr. Edward Hain. Mr. Massey-Mainwaring observed that, though the Houses of Parliament were so beautiful outside, the ventilation and sanitary arrangements were most imperfect.

The toast of "The Imperial Forces of the Empire" was next given, proposed by Mr. W. A. McArthur, M.P., and responded to by Major-General Hamley, C.B., and Colonel F. J. Hext, R.G.A. Mr. T. P. O'Connor, M.P., then proposed "The London Authorities," whose great work was, in his opinion, the breaking down of that isolation of individuals characteristic of great cities like London. In the course of his speech he jocularly observed with regard to the several mayors present that he expected to be in the company of free-born Englishmen; yet he found himself in the midst of men in chains! Alderman Sir William Treloar, Mr. G. L. Gomme (clerk to the London County Council), Mr. E. Barnes, J.P. (Mayor of St. Pancras) and Dr. James White (Mayor of Lambeth) responded.

Sir Wyke Bayliss proposed the toast of the evening—"The Society of Architects and Architecture." "Architecture," he said, should be under the control of architects and not of painters. Each saw with different eyes and thought with different thoughts. The painter saw in the plane, with two dimensions: the architect saw

in the round, with three dimensions. Neither the Parthenon nor Westminster Abbey was conceived by a painter, and it was not for either to trespass on the other. Whilst looking over a portfolio of his (the speaker's) sketches of Italian churches the late Cardinal Manning admitted that there was beauty in all of them, but his heart was not stirred till he came to St. Peter's, Rome. Two things were there—a great circle and a great arch above; but that was enough. He admitted that at Westminster there was beauty in part, but at St. Peter's you saw it at once, all, and for ever. It was the *idea* that lifted architecture to the level of a fine art. The president and Mr. Alfred Darbyshire responded. Other toasts were "The Arts and Crafts allied to Architecture" and "The Visitors." In proposing the latter Mr. Walter W. Thomas, referring to the Liverpool Cathedral question, suggested that the model of Wren's earlier St. Paul's might be sent down to Liverpool for consideration with the other designs.

Engineering Notes.

A New Subway at Clapham Junction has been opened by the London and South-Western Railway Company for passengers.

The Scheme of further Ventilating the House of Commons has been begun. A hole has been made in the roof by removing one of the sloping panels over the Strangers' Gallery, and an electrically-worked fan will be fixed there.

A New Telegraph Recording Instrument.—The Typewriting Telegraph Corporation, Ltd., of 303-5, Dashwood House, New Broad Street, E.C., are the proprietors of Stelje's Telegraph Recording Instrument. Its chief features are that no batteries are required. (The necessary current being obtained from a magneto driven by hand or power) and that it automatically records messages being sent.

Underground Tramways.—Last week a Committee of the House of Commons had under consideration the London County Council Subways and Improvements Bill. The proposal was to construct a tramway, worked by electricity, commencing at Theobalds Road, where it would form a junction with an existing tramway, now the property of the London County Council, though it is not worked by them. Thence it would fall in level until in Southampton Row it would be below the level of the street, and it would then, in a shallow subway, pass along the site of the supposed new street from Southampton Row to the Strand until it met the crescent near the Strand, which the Council have power already under an Act of 1899 to construct. There it would turn towards the Embankment, on reaching which, near Waterloo Bridge, it would come out on the level. The tramway is an attempt to deal with the problem of the congestion of the streets. At no distant date the London County Council will be able to work the whole of the tramways in London by electricity. Mr. Alfred Baker, manager of the tramways worked by the London County Council, described the system of tramways in Boston, America, very similar to that now proposed, the results being most satisfactory. Mr. Fitzmaurice, chief engineer to the London County Council; Mr. Joseph Baker, vice-chairman of the Highways Committee of the London County Council; and Mr. J. H. Ryder, electrical engineer to the Council; gave evidence. The Committee passed the preamble of the Bill.

Mr. William Stirling, architect, late of York Buildings, Adelphi, has committed suicide at the age of forty-one years. Mr. George Cawthorn, estate agent, of the same address, said at the inquest that Mr. Stirling lived the life of a recluse. Not having seen him for fourteen days, witness on Thursday last called in the police, and they found him lying on the floor in a pool of blood, from wounds in the throat self-inflicted by a razor. Mr. William Kingross Arber, solicitor, stated that Mr. Stirling was his second cousin. He was an exceedingly clever architect, but a disappointed man, not having met with the success he merited. He had no desire to associate with his fellow-creatures at all. His father died from softening of the brain. Mr. Stirling was Assistant Professor of Architecture at University College, London.

Builders' Notes.

British Fire-Prevention Committee.—Publication No. 65 describes and illustrates the new testing station at 66, Porchester Road, Westbourne Park, W.

The Plumbers' Company will present Mr. Andrew Carnegie with the honorary freedom at the Guildhall on Wednesday, May 14th, in recognition of his munificent gifts for the promotion of education amongst all classes of the community.

Mr. William Wilson, builder, of Edge Hill, Liverpool, died recently at the age of sixty-seven years. He was a native of Milnthorpe, Westmorland. When a young man he went to Liverpool, and commenced operations as a master-builder, soon acquiring a wide connection. He executed a number of important contracts.

The Builders' Clerks' Benevolent Institution held its twenty-fourth annual dinner at the Holborn Restaurant last week. Mr. F. L. Dove, president, occupied the chair. Mr. E. Brooks, treasurer, stated that when the first report was issued they had £638 invested, whereas that item in the accounts was now £7,000. They used to give pensions of £20 a year to the men and of £15 to the widows; and the amounts were now £30 and £24 respectively. Mr. J. Austin, the secretary, announced subscriptions and donations to the amount of over £300.

The Building Trade in Portsmouth.—At a recent meeting of the Portsmouth Trades' Council attention was called to the depression in the building trade, and it was asserted that there were many workmen who had not been able to get a fortnight's work since Christmas. Distress was rife, and relief was much needed, and it was suggested that grants to the needy might well be made out of the accumulating surplus of about £600 raised about eight years ago, when distress in the winter was very acute. Several members gave personal testimony as to the serious character of the distress, and it was decided that the Mayor should be approached on the matter with regard to the formation of a relief fund or to the making of grants from the fund. The Eastney and North End districts appear to be untouched by the depression, and this is easily accounted for by the fact that building there is constant and regular, North End being especially busy just now with new churches, and the builders have their full staffs at work. If it were found necessary to distribute the fund, the Mayor said it would be necessary to see that only the artisans who had actually belonged to the town, or had been resident in it for some years, should participate.

London County Council.—At last week's meeting of the Council the Parliamentary Committee reported that there were twenty-six Bills before Parliament dealing with "tube" railways in London, and up to the present time fourteen of them had been referred to a Lords Committee. The Highways Committee urged the necessity of some specially-constituted body being established to which new schemes for the provision of means of transit in London might be referred, in order to secure uniformity and systematic action in the matter. It was to be borne in mind that the question of locomotion was closely connected with the provision of housing accommodation, the control of the increasingly congested traffic of London, and other important problems, and this fact made it the more essential that a special authority should be entrusted with the duty of dealing with the transit question in London. After discussion the subject dropped.—Dr. Longstaff, as chairman of the Building Act Committee, said with regard to the Hackney fire, in which the construction of the building was such as to prevent the use of fire-escapes, that the Fire Brigade Committee might obtain some suggestions as to buildings which could be of use to the Building Act Committee. Something might then be done by imposing conditions as to the way in which alterations and additions were made to existing structures.

Mr. Christopher Harston, F.R.I.B.A. (of the firm of A. & C. Harston, architects, of London), has been appointed a justice of the peace of the county of Kent for the Dartford Division.

ARCHITECTURAL ASSOCIATION.

ARBITRATIONS.

By E. A. GRUNING.

A MEETING of the Architectural Association was held last Friday, Mr. G. B. Carvill, vice-president, in the chair. Mr. H. A. Hall was elected a member of the Association, and the following additional donations to the New Premises Fund were then announced:—

	£	s.	d.
W. H. Lever	-	-	25 0 0
W. Henry White	-	-	10 10 0
C. de Gruchy	-	-	5 5 0
H. E. Rider	-	-	5 5 0
L. Jacob	-	-	3 3 0
E. J. Stubbs	-	-	2 2 0
Francis R. Taylor	-	-	2 2 0
A. C. Dickie	-	-	1 1 0
T. T. G. Donaldson-Selby	-	-	1 1 0
V. A. Flower	-	-	1 1 0
H. W. H. Palmer	-	-	1 1 0
W. M. Paton	-	-	1 1 0
H. O. Trimmell	-	-	1 1 0
Horace White	-	-	1 1 0
C. H. Strange	-	-	1 1 0
G. Vernon	-	-	1 1 0
A. T. Griffith	-	-	1 0 0

Donations previously announced 4,063 8 6

Total £4,127 4 6

Mr. E. A. Gruning then read his paper on "Arbitrations," of which the following is a summary:—

I propose to speak simply on arbitrations from the architect's point of view, and to confine myself entirely to such as may occur in the ordinary practice of an architect. I propose also not to go too deeply into the question of precedents, or of law. In fact, as far as possible, to base my remarks on the knowledge I have personally gained in active practice.

Arbitration was really the earliest species of law. In primeval times the king or head of a tribe was the arbitrator, both in civil and criminal cases. In course of time, law superseded arbitration, but a reaction set in, by which arbitration has become more than formerly a recognised means of settling disputes, being now invested with legal powers, which until recently did not exist.

Although many arbitrations had taken place under agreements, the beginning of this change arose with the legislation of the Law Procedure Act of 1854. But the Arbitration Act of 1889 did more than anything to put arbitrations on a proper basis, and to invest them with a dignity and importance which till then they had not possessed. Without going into the detailed provisions of this Act, it may be said that the arbitrator has all the powers of a judge of the High Court, except the power of committal to prison for contempt of court. His proceedings are as strictly defined as those of the courts, and he cannot be deposed except for misconduct or corruption.

The object of arbitration is, or should be, to simplify the decision of disputes. The arbitrator should be an expert in the matter which he has to decide, the object being to avoid waste of time in informing him of the customs of professions and trades, and bringing evidence necessary to prove such matters, which he should, of his own knowledge, be able to decide upon without any such evidence. Arbitrations, too, should not, if before a lay arbitrator, be allowed to involve questions of law. These, if they do arise, are better dealt with direct by the proper courts, though I shall afterwards show how an arbitrator can deal with them in case of need.

There are three classes of arbitration—first, with two arbitrators and an umpire, the decision of the umpire alone being final; secondly, where the decision of the umpire in conjunction with one of the arbitrators is necessary; thirdly, where there is a sole arbitrator. With regard to the first, excepting the cases to which we shall refer hereafter, it is desirable to avoid having two arbitrators and an umpire, unless the arbitrators conduct the case on behalf of their respective clients. This is not so if counsel or solicitors are employed, and in such a case the two arbitrators merely sitting with the umpire are practically more ornamental than useful. Under the second head there is only one class of arbitration, namely, that of

party walls, under the Metropolitan Building Act of 1894. Here it is necessary that two of the three surveyors should sign the award. Under the third head, where there is a sole arbitrator, this is, in many respects, the best method of arriving at a rapid decision on the points in dispute.

The matters which come to the arbitration of an architect or surveyor can be classed as follows:—

Party walls under the London Building Act of 1894; dangerous structures; questions arising out of the various factory Acts and amendments thereto; questions relating to light and air; building contracts; dilapidations; professional questions between architect and client; and compensation cases. (Under this last head would be included insurance claims.)

With regard to the party-wall question under the London Building Act, 1894, this is really the most frequent of disputes arising in our practice. The method of dealing with it is very carefully set out in section 8, and I need hardly here waste time in describing the nature of the procedure. It amounts to this, that an arbitrator or surveyor is appointed by the building owner, and another by the adjoining owner, and if these two gentlemen cannot agree on the merits of the case, they must agree to refer the matter to the umpire, technically known as the third surveyor.

With regard to the dangerous structures, this is a new form of arbitration, arising under the Act of 1894. Formerly all such cases were under the jurisdiction of, and were tried at, the police court of the district. It is now open to any one considering himself aggrieved by the receipt of a dangerous structure notice to give notice under Part 9 of the Act, provided he does so within seven days, requiring the matter to be referred to arbitration and clause 107 of the Act prescribes the method in which this shall be done. It is practically a repetition of the procedure in party walls, with the exception that the award is signed by the arbitrator or umpire only. In this case, if the owner of the alleged dangerous structure does not demand within seven days after service of the notice the appointment of an arbitrator, the matter reverts to the police courts, as under the former Acts.

We now come to arbitrations on questions of light and air, by far the most difficult of any with which an architect or surveyor can be called on to deal. The state of the law on this subject could not be more unsatisfactory than it is, owing to the conflicting decisions of various judges and the reversal of the judgments of the court of first instance by the Courts of Appeal—notably in recent cases. Efforts are being made to obtain a revision of the law as to easements of this class by a joint Special Committee appointed by the Royal Institute of British Architects and the Surveyors' Institution, with the assistance of two eminent King's Counsel. A Bill will be introduced into Parliament, we hope, in the current session. The main principles of the proposed Bill are settlement by arbitration, the proceedings being similar to those under the Factory Act; the elimination of extravagant claims for special uses of ancient lights; the extinction of claims of this class in future buildings not already possessing ancient lights; and the simplification of means of objecting to such lights being acquired by the simple means of giving a statutory notice of objection instead of the present cumbrous and barbarous means of erecting and maintaining screens or other physical obstructions. Arbitrations under this head arise under different circumstances. The arbitrator or umpire may be appointed by agreement; he may be appointed by the Judge of the Court in which the case is tried, or he may be required simply to report to the Judge his independent opinion of the case. In this sense he is practically an arbitrator, inasmuch as the Judge would probably, and in nearly every case, give his judgment in accordance with such report, if confined strictly to questions of fact. The duties of the arbitrator here are very wide, and he can, and should, often do much to bring the parties together by suggesting a reasonable compromise, either by the modification of the defendant's proposed building by reasonable compensation for the injury likely to be inflicted, or often successfully by suggest-

ing an improvement to the plaintiff's building—of course, in the latter case to be carried out at the expense of the defendant.

The next class we have to deal with are dilapidations. These are more strictly matters of account. The repairing clauses in leases and agreements are often vague, and it is, therefore, often difficult to arrive at a decision. The arbitrator must determine on the items of claim which he intends to allow, and after that, price them according to the best of his knowledge.

A more delicate question than that arising between architects and their clients cannot be conceived. The procedure is the same as in other arbitrations, but in this—more than in any other class of cases—there is apt to be personal feeling and recrimination. In my own experience most such cases arise where the so-called architect is not a member of the Royal Institute of British Architects, but nevertheless attempts to use, and often to unduly interpret and strain to the utmost, the schedule of professional charges.

With compensation cases the architect has comparatively little to do. These claims generally arise with reference to properties taken under the authority of an Act of Parliament. I am sorry to say that, with the occasional exception of the plaintiff's case in actions for injury to light and air, there is no class of arbitration or trial in which such exaggeration takes place as in compensation cases. This would seem to arise under the idea that a jury or an arbitrator would average the claims made against the counter offers.

With regard to the duties of arbitrators and umpire. Should arbitrators be employed, their duty is to prepare each his own case; to boil it down and simplify it, so as to only produce the salient points of real importance at the hearing. He should, if he can, endeavour to ascertain and to work out the opponent's case, so as to be ready to meet his opponent's arguments. He should have every drawing, every paper that he has to produce during the case readily accessible and at hand, in order to avoid waste of time. In party wall cases, before the third surveyor is called in, accurate drawings should be made of the wall, both in plan, elevation and section. The wall should be plumbed to ascertain how far, if at all, it is out of the upright; and the nature of the materials of which it is composed should be as far as possible ascertained. The surveyor to the building owner should also be prepared to state exactly what he really proposes to do, which cannot always be disclosed by the statutory party-wall notice, as this has to be given in advance, and it is not always possible at first to ascertain the exact circumstances of the case and condition of the structure in question.

Now, in speaking of the duties of arbitrators as such, where there is an umpire, I may as well say that under this head I include the duties of architects or surveyors who have to prepare their side of the case for hearing. In all of these cases the same care should be taken in preparation—no points should be overlooked, and the points likely to be raised by the opposite side should be foreseen. The two architects, whether acting as arbitrators or not, should before the hearing agree to facts as far as they possibly can; they should verify each other's drawings. In cases of light and air they should prepare a model, to be jointly agreed upon by both parties, and they should do everything to avoid disputes as to fact at the hearing, so that time will not be wasted in producing a lot of evidence to prove anything which ought not to require proof at all.

With regard to the Factory Acts, arbitrations are a procedure of comparatively modern form. They arise out of the operation of the original Factory Act and of numerous amendments of such Act, and are confined to determining the necessary provision for means of escape in case of fire, and to certain sanitary arrangements, both of which appear formerly to have been much neglected. Many difficult cases arise, owing to practical considerations, and the necessity of obtaining rights of way or access to the premises of neighbouring owners. In this case the presence of umpire and two arbitrators is necessary at the hearing. The parties may or may not be represented by solicitors or counsel. The decision, however, rests solely with the umpire. As in all other cases, there is an appeal

to the Courts; but this appeal can only be on points of law and the validity of award, but not upon the facts as originally decided.

Troublesome matters are arbitrations arising out of builders' contracts. Here, again, much can be done to shorten a reference by agreeing beforehand to such items as possible, and also by agreeing in what order the claim and counter-claim, if any, should be taken, so that in case of need an interim decision may be given, shortening disputes only too likely to prolonged. Under the form of contract now in general use, the arbitration can only be opened after completion of the works, or when either party is dissatisfied with the architect's final certificate. But there are many cases in which much friction can be avoided and time saved by a hearing during progress of the works. The architect of a building must always remember that he is not only the agent of his client or employer. He must also during progress of the works as above mentioned hold the scales of justice between employer and contractor. Questions as to material and workmanship may arise which it is difficult to determine later on, when much of the constructive work has been covered up.

As to dilapidation arbitrations, I think I have already said nearly as much as I need. These rarely get into the Courts; they are generally settled by the surveyors on behalf of claimant and landlord, and tenant or defendant, an agreement being come to before negotiation, as to the name of the third person, or umpire, whose decision shall be final. They are matters of little interest, rarely involving any special principle of law, but really only being a money dispute.

With regard to disputes between architects and clients, I think I need add no more to what I have already said. In compensation cases, the procedure is practically the same as in other arbitrations already noticed.

I have, therefore, so far, I think, defined the various methods of procedure, the duties of the umpire and arbitrators, including under the latter head the architects or surveyors employed to advise their respective clients.

We now come to the preparation of awards. The first duty of the arbitrator or umpire is to ascertain that he is properly and legally appointed, to receive and take into his possession the documents or agreements referring to such appointment, to ascertain generally the nature of the claim and counter-claim, if any, so as to avoid what I may call fishing claims, and to regulate the order in which the case shall be heard. The arbitrator or umpire may be appointed in various ways; he may be appointed by a judge of one of the High Courts; he may be appointed by agreement, or by some person to whom his nomination has been referred, such as the President of the Royal Institute of British Architects, or of the Surveyors' Institution; he may be the person specially nominated in a building contract as the arbitrator. The preliminary points being settled, he must proceed with the hearing, first arranging as to whether witnesses are to be sworn, and must show great patience in allowing all matters to be brought forward, and at the same time firmness in stopping irrelevant matter and personal recrimination. He sometimes may, in questions of light and air particularly, be able to make a suggestion which practically puts an end to the case, and it is his duty, whenever he can do so, to shorten the proceedings by means of proposing a fair compromise. He should avoid interfering in the conduct of the case, leaving each party to conduct his own case, and only speaking when it is necessary to give a decision on a point of procedure or to settle or define a doubtful answer. He should particularly avoid showing any leaning to either side, and should allow no expression of his opinion as to the merits of the case to escape him. In rare cases it may be necessary for him to give an interim decision, or to state a case for the opinion of a superior court prior to proceeding further; for instance, he may have to decide in a disputed account whether or no there is a contract; but this should not be done unless absolutely necessary. At the conclusion of the hearing, having given both sides a fair and impartial opportunity of bringing forward evidence and statements, he should reserve his decision in order to read through the evidence and his own notes. These he should make himself, shortly,

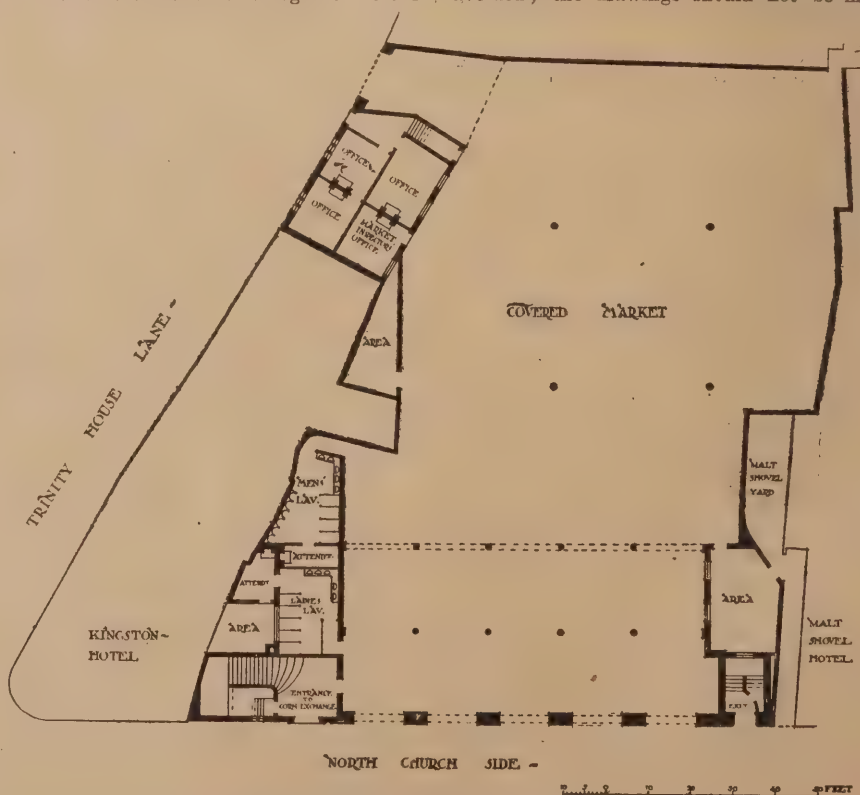

both of the arguments on either side as well as of the heads of the evidence. If shorthand notes are taken throughout the whole of the proceedings, his own short notes, embodying only the salient points, are much easier of reference than a verbatim report. It is always well to agree, with regard to shorthand notes, by whom they shall be paid for in the first instance, and that they shall be accepted as correct by both parties. It is perfectly useless to have two shorthand writers, one on either side. Generally speaking, it is convenient to have shorthand notes taken of the whole case, without necessarily having them transcribed in their entirety. It saves a great deal of time to have the speeches of counsel and arguments transcribed, as it is impossible for the arbitrator or umpire to follow these exactly with his notes without causing great delay. The heads of evidence he must himself be able to take down. In purely technical cases, such as dangerous structures, party- or party-fence walls, arbitrators or umpires should be capable of drawing their own awards. In fact, the Act would seem to preclude the employment of solicitors or counsel in these cases. The award should always begin with a recapitulation of the origin of the dispute; under what circumstances it has arisen, whether under contract or otherwise. This part, generally called the preamble, should be accurate and should enumerate the whole matter concisely. The award itself should be drawn carefully in as few words as possible, setting forth the items in dispute in separate paragraphs, one paragraph to each item rather than a connected sentence, stringing them all together, and it is sometimes necessary to attach and refer to diagrams or plans, &c. In it the arbitrator must recollect that he is both judge and jury, and in fact he has more power than a jury. A jury's decision can be upset on the ground of misdirection by the judge who sums up. An arbitrator has no one to sum up to him, and his decision on the facts is absolutely final, except as I have mentioned in party-wall cases. In most cases, except those above-named, it is advisable to employ a solicitor to draw the award, furnishing him, of course, with all documents necessary to draw the preamble, but not with more than the heads of the decision at which you have arrived. If a legal point is strongly contested during the hearing it is better to state at once that if such point is insisted upon you will make your award subject to a special case to be stated to one of the superior Courts. An arbitrator must also remember that he is not altogether in the

position of a judge. He has to decide on facts, and not on law, and for that reason it is undesirable and unusual that he should in any way give any hint of the reasons which have induced him to come to his decision. I have heard it said that this is cowardly, and that a man should be prepared to give his reasons for anything that he does, but I cannot see that this accusation is correct. The arbitrator has to do his duty according to his conscience, and the very essence of his employment is to put a final end to the dispute. His simple decision on a point of fact is an end of this, whereas if he gave reasons he might leave the matter open to continued and prolonged further litigation. Where a case is stated for the opinion of the superior Court it is necessary to give alternative decisions—that is, if the Court rule one way, then the decision will be so-and-so, the alternative decision being given in case the Court rules the other way.

As to costs of arbitrations, these generally follow the decision, but in many cases both parties may be equally in the wrong, and it may be necessary to give some decision as to how costs are to be allotted. Both parties cannot be equally in the right.

One last word on awards. In making an award do not hesitate, or attempt a compromise. As far as possible give your award one way or the other. Nothing is so unsatisfactory to both parties as striking a balance, or "splitting the difference." Care must also be taken to issue the award within the periods prescribed by the Arbitration Act. But the umpire or arbitrator has power to enlarge the time for this, provided he does so in writing prior to the expiry of the prescribed period.

Now, having spoken of arbitrations, I should like, with your permission, to speak on the question of their avoidance. In building contracts, for instance, the necessity for arbitration often arises out of carelessness, either in the preparation of drawings, specifications and sometimes of quantities, or out of the want of proper notes made during the carrying out of the works. It is only fair to a builder or contractor that at the outset of the job he should know fairly well what he has to do. To him it will make a great difference in organising his work and in ordering his materials; in fact, it may make the difference to him between profit and loss. In the first place, in contract drawings every line should be definite, and should mean something; every colour should be an indication of material; shading should be avoided; the drawings should not be mixed,

Details being superimposed upon small scale drawings. Everything should be set out as far as possible with the view of giving the workmen actually employed what amounts to a book that they can read. Drawings and draft specifications should be completed before being placed in the hands of the quantity surveyor. Generally the quantities form no part of the contract, but it is only fair that the notes made by the quantity surveyor during the progress of his work should be carefully considered and added to the drawings and to the specification. The quantity surveyor should also have ready access to the architect during the process of taking out quantities, in order that any point not clear on drawings, &c., can be made so before the work is tendered for. An architect should, as far as possible, avoid all alteration of his design during the progress of the works, and ought to have made up his mind beforehand what he wants to have. Alterations are a fruitful source of dispute, though they often cannot be avoided on account of the idiosyncrasies of clients. The next great cause of dispute arises out of the question of giving orders for extras, omissions and variations. It is almost impossible on works to give a written order for every variation and instruction required, but the clerk of the works or foreman can be instructed to make notes of these as they occur from day to day to submit them to the architect on his next visit, and if the architect initials them they can be then acknowledged to be orders in writing under the terms of the contract. The proper provision of full-sized and detail drawings and other details at the earliest stage of the works is of great use to the contractor, and the showing of consideration to him in facilitating the setting-out of the work and the ordering of goods is an inducement to him to do his work conscientiously. Of course, builders are also often in fault, raising contentious and unwarrantable claims. The only remedy for this is steadily to refuse to entrust them with further work. With one more remark I shall conclude. A constant source of trouble in contracts is the attempt to please our client by trying to get a larger amount of work or more elaborate work done for him than an architect can properly expect for the amount placed at his disposal.

Mr. A. O. Collard, in proposing a vote of thanks to Mr. Gruning, said he thought there should be no law with regard to ancient lights, for everyone should be required to build with a regard to his neighbour's land. Mr. Henry T. Hare seconded the vote. He thought that quantities should always be made part of the contract. Mr. H. J. Leaning said he was looking forward to the time when a special court of law would be established to deal with building matters. The objection to arbitration was that no precedents were established. Messrs. C. H. Brodie, H. A. Satchell, Henry Lovegrove and G. B. Carvill also spoke. Mr. E. A. Gruning in reply said he agreed that there should be no law of ancient lights, but as it was useless to try and get it abolished the Institute was doing its best to get the injustice minimised as much as possible, and there was no doubt the Bill it was promoting would go very far to do away with disputes.

R.I.B.A. ANNUAL REPORT.

THE annual report of the Council for 1901-2, to be submitted at the annual general meeting next Monday, states the present membership to be 1,732, made up of 617 Fellows, 1,071 Associates and 44 Hon. Associates: a nett increase of 37 during the year. Reference is made to the following appointments—Mr. W. M. Fawcett and Mr. W. H. Seth Smith as representatives of the Council on the Council of the Architectural Museum; Mr. P. Gordon Smith on the Board of Directors of the Architectural Union Company, in place of the late Mr. Arthur Cates; Mr. E. A. Gruning on the Tribunal of Appeal, also in place of the late Mr. Cates; Mr. W. D. Caröe as representative on the Coal Smoke Abatement Society; Mr. Thomas Blashill and Mr. John Slater as representatives of the Institute at the annual congress of the Sanitary Institute to be held next September at Manchester. The portrait of Mr. Penrose (by Mr. Sargent, R.A.) has been copied

GROUND AND FIRST-FLOOR PLANS, NEW COUNCIL OFFICES, HEATON MOOR, STOCKPORT. WOODHOUSE & WILLOUGHBY, ARCHITECTS.

for Magdalene College, Cambridge, by Mr. C. M. Newton. The Council supported the Ulster Society of Architects with regard to certain clauses in the Belfast Corporation Bill (see p. 343 of our issue for January 1st last); these clauses have now been dropped in Committee of the Lords, and the Society have withdrawn their opposition. The joint committee have drafted a "Bill to amend the Law relating to Easements of Light" which has received the approval of the Institute and the Surveyors' Institution, and the matter has been referred back to the joint committee, with powers to bring the Bill before Parliament as soon as possible. The Council have invested £1,000 in Indian Government Stock as the nucleus of a Building Fund for new premises (which are urgently needed), and will be glad to receive any donations. A joint committee of the Institute and of the Architectural Association have met to consider the combination of the two organisations in one building scheme; the Council, while agreeing that they should both occupy one site, think that the respective premises should be to all intents separate buildings. Sites are now being considered. The Institute needs about 10,000 ft. super, and the Association half that space. The Council have granted fifty guineas to the Cretan Exploration Fund (Knossos excavation) and twenty guineas a year for five years to the British School at Rome. There is a balance of £1,300 over expenditure for the year; and additional investments have been made which bring the total invested capital up to £11,500.

The Art Standing Committee report that,

although the whole of their suggestions with regard to the widening of London Bridge were not adopted, modifications have been made on the lines they recommended. A letter was sent to the Dean of St. Paul's asking that the designs for the proposed decoration of the drum of the dome might be publicly exhibited before the work was begun, but the Dean's reply contained no undertaking that there should be such an exhibition. The Science Standing Committee report that the results of the experiments for ascertaining the strength of different kinds of brickwork will, it is hoped, be shortly issued in pamphlet form. The supporting power of rocks and soils is still under consideration, as well as the proposed standard sizes of steel sections, and the subject of cement-concrete in flats and floors.

The Manchester Society of Architects held its annual general meeting on April 24th, when the following officers and members of council were elected:—President, Mr. Alfred Darbyshire, F.R.I.B.A., F.S.A.; vice-presidents, Mr. J. P. Cass, F.R.I.B.A. and Mr. J. W. Beaumont, F.R.I.B.A.; hon. secretary and treasurer, Mr. Paul Ogden, F.R.I.B.A.; assistant hon. secretary, Mr. George Brown; members of council, fellows: Messrs. B. W. H. Brameld, John Ely, F.R.I.B.A., E. Hewitt, F.R.I.B.A., J. S. Hodgson, J. Horstall, F.R.I.B.A., J. D. Mould, F.R.I.B.A., W. A. Royle, F.R.I.B.A., J. H. Woodhouse, F.R.I.B.A., and P. S. Worthington, M.A., A.R.I.B.A.; associates: Messrs. F. B. Dunkerley, A.R.I.B.A., A. H. Mills, A.R.I.B.A. and Isaac Taylor

Law Cases.

Serving Notices on District Surveyors.—At the South-Western Police Court recently Benjamin Briston, a builder, of West Norwood, was summoned by Mr. Percy Hunter, the district surveyor, for beginning to execute certain work without giving the requisite notice. Mr. Ward defended. It was pointed out that the notice was deposited by his client in the letter-box of a house at Norwood where Mr. Hunter had his office, and he (Mr. Ward) argued that this was a sufficient notification within the meaning of the Act. Mr. Hunter said as a matter of fact the notice never reached him. The magistrate thought it was not a proper service to place a notice through a hole in the street-door. Mr. Ward said such a contention might arise in the case of a large building set out in a number of offices, but Mr. Hunter rented the whole of the house. Moreover Mr. Hunter had an opportunity of receiving personal notice, for he understood that the notice was placed on his office table by the office-keeper, who gave evidence to this effect. The magistrate was satisfied that the notice never reached Mr. Hunter, but in the circumstances he only required the defendant to pay the costs of the summons.

Keystones.

The Queen Victoria Memorial Fund now stands at £194,000.

A New Library at Armley, Leeds, has been erected at the corner of Stocks Hill and Wesley Place. Mr. Percy Robinson, of Leeds, was the architect.

An Expansible Dining-Room.—Sir James Blyth has had set up in his home in Portland Place, W., means for noiselessly doubling the size of the dining-room. The partitioning wall, with doors, pictures, &c., is made to slide through the floor.

As a Coronation Memorial at Llangollen it is proposed to construct a massive stone bridge to span the River Dee near Berwyn station. The structure will in all probability exceed the estimated cost of £2,500, as the necessary foundations and abutments will have to be specially dealt with.

The New Fylde Joint Isolation Hospital at Moss Side, Lytham, has been opened. The hospital comprises a large pavilion for the treatment of scarlet fever and a pavilion for typhoid fever and diphtheria, nurses' home and administrative buildings, discharge- and waiting rooms, mortuary and ambulance, laundry and disinfectant, electric-light station and a porter's lodge. The architects were Messrs. Haywood & Harrison, of Accrington and Lytham; and Mr. Samuel Wilson, of St. Annes-on-the-Sea, was the contractor for the work.

A New Fire-Station at Stockport has been opened in Mersey Square. It is the centre of the electric tramway system, and the car sheds are in the rear of the new building. Central tramway offices are to be erected, with frontage in line and in harmony with the fire-station. A conspicuous feature of the new structure is a drying tower, rising to a height of 100ft. The style of the main building is Gothic, faced with Accrington stock bricks, with Scotch redstone dressings; the main entrance doorways are of stone. The building is divided into four blocks, namely, engine-house, stables, firemen's dwellings and workshops. The cost has been about £12,000.

A Statue of Beethoven has been executed by Max Klinger, the great German sculptor, who has been occupied with the work for no less than fifteen years. The statue is executed in bronze, marble, ivory and onyx. Beethoven is sitting on a magnificent throne as in a trance, meditating on the problem of symphony. The throne is cast in bronze and its back shows the marble heads of lovely geni. The body of the composer, leaning slightly forward, is in white Greek marble. His hands are clasped on his crossed legs, which are covered with onyx drapery. At the composer's feet is a mighty eagle with outspread wings looking up at him. It is a magnificent work, but will certainly not remain uncriticised.

The New Quarter-Sessions House and Coroner's Court for West Ham, erected and fitted by the Corporation at a cost of £13,000, was opened recently.

The late Mr. Phil Morris, A.R.A., who died last week in his sixty-eighth year, was apprenticed to an engineer in his early days, though he had no liking for the work. Ultimately, with the help of Mr. Holman Hunt, he was enabled to devote himself exclusively to the study of art.

Special Elections to Fellowship R.I.B.A.—Mr. Arthur Harrison (president, Birmingham Architectural Association) and Mr. Arthur Wakerley (president, Leicester and Leicestershire Society of Architects), as presidents of allied societies, have been elected to the Fellowship of the Royal Institute of British Architects.

A New Railway Station for Cross Gates, Leeds, is being erected by the North-Eastern Railway Co. The new station buildings will comprise the station-master's house, booking and station offices, waiting-rooms and lavatory, porters' rooms, platelayers' cottages and a large storage warehouse.

An Exhibition of Drawings from "Punch" will be opened at the Woodbury Gallery, 37, New Bond Street, W., on Monday, May 5th, the whole of the proceeds derived from admissions, by the kind consent of the proprietors of the gallery, being devoted to the funds of the Hospital for Sick Children, Great Ormond Street, Bloomsbury, W.C.

The Academy.—Last Thursday, Friday, Saturday and Monday were varnishing days at the Academy. Yesterday the gallery was given over to be cleaned and swept. To-day and the forenoon of to-morrow are for the critics; Thursday afternoon for royal and distinguished visitors. Friday is the private view, Saturday the banquet, and next Monday the galleries are open to the public.

Partnership Dissolved.—The partnership subsisting between Messrs. William Rycroft & George Atkinson Firth, architects and surveyors, of Bank Buildings, Manchester Road, Bradford, under the firm of Rycroft & Firth, has been dissolved by mutual consent, and in future the business will be carried on by Mr. William Rycroft alone, in his own name, who will pay and receive all debts owing from and to the said partnership.

A Statue of Queen Anne at Kingston-on-Thames was unveiled by Viscount Hayashi, the Japanese Minister, last week in the Market Place. The statue has, according to report, beep in the town since the renovation by Queen Anne herself of the old Market Hall, originally built by Queen Elizabeth and removed in 1840 to make room for the present one. All that now remains of the ancient hall is the market bell, some stained-glass windows, and the statue, but the last had grown dingy with the passage of years, and it has now been re-gilt.

Mr. Seymour Lucas, R.A., in opening a picture exhibition at West Ham last week, said the Church in the Middle Ages thoroughly realised the advantages of pictures. In the days of the Renaissance many of the churches were turned into little picture galleries and had their influence. Photography had had a bad effect on art; it served to present things in a literal sense rather than a poetic sense. Realism in art was not wanted; the great painter put into his work his art, and it was that which was the merit and value of the work. Plate-glass, which flooded places with light—whereas art was all light and shade—had also robbed art.
